THE recent meeting in Washington was not only the largest, but the best in every respect, that the Association has ever held. There were fishculturists from every State between Maine and Nebraska, and Michigan and North Carolina. It was gratifying to the friends of the Association to note the return of the Commissioners from the New England States, who left it some years ago on account of difficulties with one who was then prominent in its councils. The meeting at Washington was also supplemented by a session of the different State Commissioners, at the request of Prof. Baird, and brought many new members. The character of the papers and discussions was of a broader nature, and we do not hesitate to call it the most important meeting yet held in the interest of fishculture.

Another great benefit derived from the place and time of meeting was the opportunity it gave the members to see the shad-hatching work in the central hatching station, where improved machinery is used, and the large operations are carried on in the most systematic manner. The Association has for years been gradually widening its sphere of usefulness, and taking in all subjects which may be in any way considered as connected with fishculture. One of these, which at present bids fair to become a vital question on the sea coast, is the culture of oysters, and this occupied a great deal of attention at the Washington meeting, and some valuable suggestions were made, which we will give in full.

THE ST. CLAIR FLATS IN CONGRESS.

THE people of Michigan are urging that the United States shall set aside the public lands of the St. Clair Flats as a permanent national park for the free use of the people. They have been aroused to do this by the endeavor of certain clubs to acquire exclusive shooting rights on the Flats. The result will be watched with great interest, for the territory in question is well known as one of the best wildfowl shooting districts in the country.

If a bill passes Congress giving the people this grand domain for a pleasure ground, where they may sail, fish and shoot, it is highly desirable that adequate provision be made for properly restricting the exercise of these privileges. The preservation and well-appointed public control of the St. Clair Flats will insure a long-enduring benefit to the people of Michigan and of the United States. We hope Congress will make a law to that effect.

THE ANTIDOTE.—Public attention is weekly called by some startling example to the pernicious effects of the diabolical police gazette and five-cent flash story-paper literature that is corrupting the young folks of the land. State Legislatures are enacting laws to suppress this monstrous evil by making the sale of such papers to minors a misdemeanor. This is as it should be. Another wise course is to supply wholesome literature to the boys. Give them healthy reading—the FOREST AND STREAM for instance. Let them inhale the odor of the balsams, then they will not have a taste for the reeking atmosphere of the five-cent novel scenes. Equip them with fishing rods and shotguns, then they will not transform themselves into arsenals of bowie knives and bulldog pistols to exterminate Indians, parents and schoolmasters.

THE CURSE OF POLITICS.—Elsewhere is given the full text of the Adirondack bill as passed at Albany. The measure is calculated to insure good results if honestly carried out. But there is a chance for political corruption to counteract the possible good. Let us hope that the Adirondacks may not be blighted by the curse of politics.

The Sportsman Tourist.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—II.

LEAVING Mancelona, a run of forty miles brought us to Petoskey, getting a sight on the way at the sleepy hamlet of Boyne Falls, of the famed Boyne River, which flows into the head of Pine Lake, six miles from the railroad. This stream was, a few years ago, noted for the numbers and size of its trout, but much fishing and the lumbermen have produced the inevitable result, and to get the good ones, the angler will have to follow it up some distance into the tangles where the waters have been little disturbed. The train stopped half an hour at Petoskey, and we had a glorious first view of Little Traverse Bay, a sheet of water that rivals in beauty its big brother, Grand Traverse Bay, further south. Here all was life and bustle. The depot platform was crowded with people, representing perhaps half the States in the Union; some going further north, many looking eagerly for friends on the train, and others looking on from idle curiosity—the latter a class that every country town is afflicted with—idlers that consider it a religious duty to be on hand, schedule time, to see the "cars come in."

As Ben said, "there's a good deal o' human natur' layin' 'round loose at Petoskey," and during the thirty minutes' stop, we amused ourselves standing on the car platform, by taking in a few of its different phases. Of course, there were the pests of the earth, the howling hackman, and the hotel runner, boiling over with impudence and lies about the merits of the respective hotels they had the honor to represent. There was the timid passenger with his gripsack, looking furtively around for a means of escape from these vultures, who were making life a burden to him. By the baggage truck was the anxious-about-his-trunk passenger, carefully looking it over to see if it had been tampered with, or a speck of the varnish scraped off.

Over there by the corner of the building was a Mossback, pure and simple, standing at rest, with both hands clasped around a long "gad" that looked as if it had done service as a persuader for a pair of sleepy oxen in surmounting a vexatious sandhill. He was taking in the whole show for nothing, and from his fixed attitude and down-hanging lower jaw, seemed to be enjoying it rather more than the expenditure would warrant. Old Ben nudged me gently, and said in his emphatic way, "That ole feller don't wear very high-toned clothes, but sich as him is jest the salt o' this livin' earth"—and Ben was right—a big truth expressed in a terse, homely phrase.

Further along the platform, was a bevy of chattering, laughing girls, bright and rosy as a summer morning, evidently on their way to the bay shore just below after sunfish, as two of them had fishing rods, and another held something wrapped in a paper that was certainly an old oyster can containing "wums." They had no doubt arranged among themselves to take turns with the rods, while two were fishing the others would do the screaming, and add their mite to the chattering when a fish was landed. They were just of an age when girls will laugh at anything and everything, and have more fun at a funeral than the average boy at a circus.

But after all, their happy laughter was good to hear, and as my thoughts wandered back to a certain "Kingfisher's daughter" left at home, I felt younger, and said to myself as the infectious melody rippled from their lips, blessed is pure and happy girlhood.

Here come three quiet, sensible looking men, each with a rod, minnow bucket and landing net, and as they file into the coach next to us we catch "Crooked Lake," and we know, without asking, that they belong to the brotherhood, and that they are going a-fishing.

"Look yander!" whispered Ben, "what kind of a thing is that? A dude fisherman, by the big bear of the Sierras," he added, nudging me violently in the ribs. [Ben spent several years in California, hence the big bear.] "Hey, Dan! get your eye on that, and then go inside and break up yer rods," with another nudge that nearly sent Dan off the platform of the car.

Making his way through the crowd, we saw a fellow heading for the forward coach, that old Ben said was "jest too sweet lookin' to live another solitary second."

He was decked out in a brand new suit of corduroy knee breeches, brown woolen stockings and a pair of laced up walking shoes. In one hand he carried an ash and lancewood rod, and in the other the indispensable landing net, while out of one of the numerous pockets of his coat we caught a glimpse of what we supposed was a fly-book, or, it might have been a cigar case. Evidently a trout killer. His head was surmounted by what Ben termed "one o' them new fangled cork lined hats, as if," he growled, "his head wasn't light enough without cork," and to finish up the outfit he wore eye-glasses, gorgeous necktie, and sported "leg o' mutton" whiskers, as Dan made them out to be. Last, Ben called our attention to a diminutive gripsack slung over his shoulder by a strap, which he remarked was, "like as not as empty as his head."

I felt a twinge of compassion for the poor devil as he passed into the car, but on a reconsideration the feeling changed into a mild form of wrath, that the gentle art should have discredit cast on it in the eyes of sensible people by such infernal idiots as this ass in knee breeches and leg o' mutton whiskers. Fortunately, however, the insect is rare, and harmless to man and fish as well. As we took our seats in the train and moved away, Ben very gravely lent us the information, "In all my travels, that's the worst case o' damfool I've ever seen on the face o' this livin' earth. Why, I'll bet he haint got the sand in him to tackle a hoss-fly, and ef he'd git into these woods five rod he wouldn't have sense enough to find his way out agin. Trout fisher!" —with supreme disgust—"put a trout and a mud turkel in a tub o' water an' he couldn't tell which from t'other, 'less the turkel would get him by the finger;" and this appearing to settle the matter in his mind, he scraped a match, and lighting the inseparable briar root, settled back in his seat in satisfied serenity. Winding around the base of the hill we passed the camp-meeting grounds, and were soon flying through a dismal-looking cedar swamp, over a narrow strip of clean sand filled in for a road bed, and after a run of six miles to Conway Springs, at the head of Crooked Lake, the train stopped two or three minutes to let off a few passengers, among the rest our three anglers and the dude. We mentally wished the brethren "good luck," and Ben echoed, I am sure, a kindred sentiment in old Dan and me when he said, in his dry way, "I hope that dude 'll get a duckin' an' lose them specs before he ketches a solitary fish," which rather uncharitable wish caused a laugh and restored, as Dick would have said, the "equibilerum" of the party.

Our original purpose had been to take the little steamer at this point and go through to Cheboygan via the "Inland Route," through Crooked, Burt and Mullett lakes, but as the boys would be waiting for us on that particular morning, the plan was changed to go on to Mackinaw City and down the M. C. R. R., in order to make our camping place the same evening, if possible. Afterward we regretted we had not made the run through by water, as Knots and Jim, who had once made the trip, were warm in their praise of the beauties and scenery of these three lakes and the rivers connecting them, but life is short, and our fingers were itching to grasp a rod and measure strength and cunning with some monarch bass or mascalonge of the lake of the dark waters, and we promised ourselves this trip "some other time."

From Conway Springs on to Mackinaw City, the road runs through as wild and utterly lonely a strip of country as ever a crow flew over. Woods, woods, and swamp and tangle so thick in places, that it looked a matter of impossibility for even a mink to make its way through the green walls that here and there line both sides of the road. And yet in this very wildness and solitude is one of the greatest charms of these evergreen and odorous north woods. To one who had gazed on nothing more enchanting than brick walls and the unsurpassed (?) forest scenery around the "Esplanade" for a year, all this wealth of wood and stream and lake, of dismal swamp and lonely tangle, of fern, and brake, and clinging mosses, was a rare treat that I thoroughly enjoyed until a prolonged whistle from the engine warned us we were approaching near to the City of the Straits.

Our traps were soon transferred to the M. C. train just across the wide platform, Frank and I carrying the "menagerie" across under a fire of questions and giggles from the idlers and loungers infesting the place. One wanted to know, "Goin' a-fishin'?" "Yes," said Frank. "What ye goin' to do with them frogs—eat em?" "No," said old Ben, as he lent a hand to hoist his camp box into the car, "takin' 'em along to keep the muskeeters off; best thing on the face o' this livin' earth fur muskeeters, black flies an' sich; eat their weight o' them insecks every day—ef you ketch 'em fur 'em."

This was said with a gravity, accompanied by an inimitable wink at Frank and me, that nearly caused us to drop the whole show, and a broad sun grin to overspread the countenance of the chump, who walked away with a new "pointer" on the use of speckled frogs for a fishing party. We were beginning to find out that Ben was a character in his way, full of dry humor and quaint sayings that made him a favorite before we were in camp a day; but more of old Ben as we go along.

We had several minutes left before the train started, which we improved in walking out toward the pier, where the ferry steamer had just left for St. Ignace, six miles across the Straits. This steamer connects with the Detroit, Mackinaw & Marquette Railroad, which runs through 150 miles of the wildest portion of the North Peninsula, a region abounding in game, and trout in nearly all the streams flowing north into Lake Superior, clear around to Duluth.

Many of the streams flowing south from the "divide" into Lake Michigan are also famous for the abundance and size of the trout in them, notably two emptying in at Gilchrist, some thirty miles west of St. Ignace. This point and many other streams along the south shore may be reached semi-weekly by steamer during the season from Mackinaw City.

I write this not from personal knowledge of the region, but from information imparted by little Charley Pike, who spent his vacation near Gilchrist two years ago, and from fish talks with "Old Bill" Hess, who, in the course of his meanderings, has kindled his camp-fire and "fit muskeeters" on half the trout streams, perhaps, of the State.

Through the misty, blue haze of this glorious July morning, we could see the dim and indistinct outlines of Bois Blanc Island off to the right, and further north loomed up out of the soft mists the grim, storm-beaten old sentinel of the Straits, the historic island of Mackinac. Here and there a sail dotted the blue waters, every stitch of canvas set and drawing, but so light was the breeze they seemed to us entirely motionless. Wrapt in silent admiration of the dreamy picture before us, hours of enjoyment were crowded into as many minutes. We took no note of time, but presently a shriek from the locomotive at the depot brought us back to the realities of life, reminding us that railroad trains wait not on individuals, and hurrying back we were soon on our way to Cheboygan and the boys. From Mackinaw City down to Cheboygan, sixteen miles, the road runs through a flat, dreary looking country, relieved only by occasional glimpses on the left of the blue waters of Lake Huron in the distance, and we were not sorry when the brakeman notified us in the musical and intelligible tone usual with brakemen that we had arrived at our destination, at least as far as the comforts of the rail were concerned.

We were heartily welcomed by the boys, who were at the depot waiting for us with the wagon loaded ready to start, and after a short stop at the Spencer House to get the gripsacks and re-arrange the loads to accommodate the additional baggage, we were off a little after 10 A. M. for Black Lake and camp.

While yet in town, we crossed the Cheboygan River, the outlet at this point into Lake Huron of all the waters west as far as Crooked Lake near Petoskey, north to the Douglass Lake region, and south for 75 miles or more, except a few small streams flowing into Lake Huron on the east. It drains the waters of Crooked, Pickerel, Douglass, Burt, Mullett, Long and Black lakes, and all the streams flowing into them, among which are the famous Pigeon and Maple rivers—the former noted for its grayling—the little Black and Rainy rivers, and scores of smaller streams that are nameless on the maps.

These lakes and streams float annually millions of feet of logs to Cheboygan, giving employment to hundreds of hardy lumbermen in the woods, and quite a little village of workmen in and around the great sawmills at Duncan City, a mile and a half down the coast from the mouth of Cheboygan River.

But "we digress." Out of town along a pleasant road, down through the little village, past the busy mills and great piles of lumber, we shortly turned off to the right into a low, swampy country, through which, however, a good road had been built, and were fairly on our way. Eighty rods, or such a matter, into the swamp, we stopped to get a drink out of a little cold trout stream winding through the tangle, as one of our drivers said it would be our last chance to take a square drink for several miles, volunteering, at the same time, the information that the waters of the brook were full of trout, a hatchery being located a short distance below, and for "two shillin'" a day permission could be had to fish the stream. Before climbing back on the wagons the Scribe, the Deacon, Mrs. Partington, our culinary artist and the three drivers proceeded to fortify themselves against a possible attack of skeeters, numerous signs of which they appeared to have discovered in the adjacent bresh, the others of us taking our chances on clear water without the addition of a qualifier. This is mentioned merely to illustrate the presence of mind possessed by the Scribe and Deacon in case of emergency, and the promptitude they display in detecting the approach of these ferocious insects and devising measures for their extinguishment.

A short distance further on we struck the "plank road," used at some time as a tramway on which to truck logs out of the woods to the water near the mills, but now falling into decay. It is made of heavy planks, a couple of feet wide and five or six inches thick, bedded level with the ground end to end, with room for a couple of horses or cattle to walk between. This led off up a low sandhill and out into the "plains" for perhaps three miles, at the end of which we dropped again into the heavier pull of a plain North Michigan country road, sand and roots and jolts, with an occasional mud hole after we got into the hard-wood forest, by way of variety. Why they are called "plains" is not quite plain to any one who has crossed the plains of the far West, where a hundred miles may be traveled without seeing a tree or bush, but they are plains, as every Michigan man you meet will tell you. As a matter of information, and to explain, they are simply tracts of country that have been ravaged by forest fires, leaving a few charred and blackened trunks and stumps of trees standing where once was a pathless wilderness. Here and there a grove of shivering, quaking aspens, a second growth of young pines and hemlocks scattered sparsely over the waste, and patches of bushes are the only evidences of life to relieve the desolation of the scene.

Some of these tracts are miles in area and are of little value only as a feeding ground for the grouse and bears in "huckleberry time." Acres and acres of this juicy and insipid fruit grow on these burnt tracts, on bushes from three to twelve inches high, so thick in many places that one may not take a step for rods without trampling them under foot. They are the large blue June berry, called blue berry by the country people, and are a source of some revenue to the lazy Indians that infest the villages and towns of this upper part of the State. They are fed to the "resorters" by the bushel; breakfast, dinner and supper, there's your huckleberry. Stop at any hostelry in the land during the season, and there is the inevitable dish of huckleberries staring you in the face, or they may be lurking at your elbow in the shape of a pie, or that breeder of night sweats, a huckleberry roll. They seem to think this particular berry a necessity to digestion, or that every tourist and angler that stops at a hotel came up there for the especial and sole purpose of eating huckleberries, and the only way to get rid of them and preserve amicable relations with the fair nymph that waits on you at table is to eat 'em (the berries) and hold your peace.

Leaving the plains, the road led into a dark shady wood of maple, beech, ash and a hemlock or pine occasionally, with here and there a wild cherry and ironwood to remind some of us of woods we had hunted squirrels in when we had more sap in our bones than now.

The change from the hot sandy plain to the cool shadows of the overhanging branches was so grateful that all but Dan and the drivers got out to walk a couple of miles and work the kinks out of our legs. Everybody was in high good humor, and many a joke and laugh and shout, smothered and pent up for a year, waked the solitudes of the old woods that day for miles around, and had our years been gauged by "how good we felt," any railroad company would have carried us at half fare rates, for verily we were as a party of boys turned loose to go a-fishing.

Even brave old Dan seemed to forget his limp and useless right arm and feeble right leg, and although unable to walk well enough to keep pace with the party, laughed and "hollered" from his perch on the wagon with the best of us.

"Wonder how fur it is to that spring one o' them drivers was talkin' about?" said Ben, as he made a pass at a deer fly hovering around his nose, "I'm so dry I feel like I could drink up a whole trout stream, trout an' all."

Two or three miles further on we unhitched to feed the horses and take a lunch, and following a path a few yards down a low hill to the left, found the promised spring, the first water we had seen since leaving the trout stream. The water was poor in quality, tasting of the marsh surrounding it, but as the Scribe said, "it served to keep us and the horses from perishing."

Here, he and the Deacon found more skeeter sign, but long practice in their peculiar line of warfare against these pests prevailed, and with the assistance of Dick, Frank and the drivers, another emergency was passed in safety.

When we returned from the spring we found Dan had established himself with the lunch basket in the shade of some bushes by the roadside, and as we approached a pair of bright-eyed little ground squirrels darted away into the thick underbrush, but soon returned, peering cautiously at us to see if we meant them harm. While we were at the spring, Dan said they had come timidly out of the woods and creeping gradually nearer had stopped within a foot of him and asked us plainly as they could with their eyes for a share of his lunch. Reaching out his hand he dropped two small pieces of bread near them, which they snatched up and, scampering back to the edge of the bushes, sat up on their haunches and ate with avidity. This was repeated two or three times, and so tame were they and such trust did they seem to place in the old Pelican's goodness of heart that had we not appeared on the scene and scared them away, Dan said he had no doubt they would have soon explored the lunch basket to see if he was not cheating them out of some of the choicest morsels. As we came up and took possession of the basket they skurried back into the woods and were not seen again, but it was a pleasing little incident that I am sure will not soon be forgotten by those who witnessed it.

KINGFISHER.

[TO BE CONTINUED.]

SHORE BIRDS.—Philadelphia, Pa., May 17.—There are many golden plover and grass plover in our Philadelphia markets. While the law allows the shooting of all the wading birds during their migratory visit to us in the spring, the first mentioned, which are of a more upland habit, are in like manner unprotected. It is a great shame that the grass plover at least cannot be allowed a short stay in May unmolested, as they are seldom, if ever, in the fine condition we find them in August on their return with their young. These birds, not long since, nested in considerable numbers in the tablelands in the elevated portions of our State wherever a meadow exists, but of late years have greatly decreased, and should not be shot before the 15th of August.—HOMO.

Natural History.

THE COUESIAN PERIOD.

Editor Forest and Stream:

With the kind permission of Dr. Coues and his publishers, I am able to send you in advance of publication a portion of the "Historical Preface" of the new "Key to North American Birds," which cannot fail to interest your readers, and respecting which I beg to say a few words.

I was present at the meeting of the Biological Society of Washington, when Dr. Coues complemented the society by laying before it a complete set of proof-sheets of the "Key," and read the substance of the "Historical Preface," in which he traced the progress and development of American ornithology from the earliest times to the beginning of contemporaneous history, dividing the time down to 1872 into six "epochs," or major divisions, and into fifteen "periods," or minor divisions, each tersely characterized in the manner which the accompanying preface shows.

In the discussion which followed the delivery of the address, Prof. Lester F. Ward proposed to carry this system of chronical classification further than Dr. Coues, of course, could have done, by recognizing the fourth quarter of the present century as a seventh "epoch," extending from 1872 to 1900, which he called the "Couesian epoch."

Heartily indorsing this proposition as I do, I beg to add a few words upon the "period" to be assigned to Coues in this epoch. In my judgment, the time from 1872 to 1884, or that between the two editions of the "Key," may appropriately be termed the "Couesian period," and I am sure that your readers will with one accord indorse the propriety of my proposition.

Prof. Ward, on the occasion referred to above, ably defined and in a few words characterized the "epoch" which he proposed, much in the same way as a thoroughly competent and broad-minded zoologist might present those strong characters which stamp a new genus when it comes within the field of his observation. Following Dr. Coues's own plan of classification, as precedented in the "Wilsonian epoch" with its "Wilsonian period," or, still later, the "Bairdian epoch" with its "Bairdian period," it devolves upon me to refer to at least some of the leading specific characters which mark the times included within the "period" I have proposed.

The old "Key," constituting as it does the initial landmark of the "Couesian period," differed in one great respect from all other works upon ornithology that had preceded it. It reached the people. The great works of Audubon and Wilson were up to that time the dream of all young American ornithologists, of which the "Key" was the realization. Its influence was both marvelous and good, and can hardly be over-estimated, for it became a living factor of the growing mind of the coming generation of men of the time in which it appeared. It fell into the hands of boys who could now "find out the names" of the birds which they saw and collected. It taught to classify, to observe, to record, and as a result of all, to appreciate and admire.

The influence of the book was scarcely more than the influence of its author who, through all this part of his life, as he has ever since been, an example of that fixedness of purpose—which honest men cannot help but esteem—added to which he has been the direct encourager of the younger workers, in a thousand ways, and in none more than the example set by himself in his cheerfulness, under many of the direst of trials which the greater share of the world's people is sure to cast across the path of such men.

The heart of the Couesian period is filled with many other noble works, familiar to all of us, and setting aside the two hundred or more minor papers by this author we see standing boldly out in relief our "Field Ornithology," "The Birds of the Northwest," "Birds of the Colorado Valley" and "The Coues Check List." These all have given an immense impulse to the advance of the science of ornithology, and all exerted an excellent influence.

It will not be possible for me to attempt in this letter even an outline of the scientific activities on foot during the mid-years of this period. It included the days of the great surveys—the Government expeditions—when many a hardy naturalist was sweeping into the general treasury the western forms of birds.

Following the digest of all this material, which had thus been collected, another feature that had been slowly growing now, in the last few years of the period, comes quite prominently in the foreground to assert itself as an additional characteristic. This is the study of the structure of birds, and as the older countries have already taught us it is the adjuster that follows in the track of the pioneer. Ornithology owes not a little to Dr. Coues for his labors in this all-important field, as many of his productions will attest.

Ah! I see the eye of every true ornithologist in the country grow brighter as he regards the picture of the triumphs for his science, that go to make up the closing days of the Couesian period.

The mere mention of the name of the center feature, here, is sufficient to bring to mind a train of thought, which if followed in all its pleasant bearings, would carry me far beyond my limits.

We all know the debt ornithology owes to Dr. Coues for his zeal and judgment during the times of the establishment of the American Ornithologists' Union, and how much this organization promises to the science in this country.

The days of the period, so full of honor and achievements, are numbered, and we have but a few more left us to enjoy the pleasures of anticipation, before its namesake will hand us the volume, that brings it to a close.

R. W. Shufeldt, Captain Medical Corps U.S.A.
Chairman Sect. of Avian Anatomy, Amer. Ornith. Union.

American Ornithologists' Union, Washington, D. C., May 3, 1884.

HISTORICAL REVIEW.

Were a modern Hesiod to essay—neither a cosmogony nor a theogony—but the genesis of even the last department of human knowledge—were he to seek the beginnings of American Ornithology, he would find it only in Chaos. For from this sprang all things, great and small alike, to pass through Night and Nemesis to the light of days which first see orderly progress in the course of natural evolution, when is first established some sequence of events we recognize as causes and effects. Then there is system, and formal law; there science becomes possible; there its possible history begins.

Long was the time during which the birds of our country were known to our inhabitants, after the fashion of the people of those days—known as things of which use could be made and studied, too, that use might be made of them. But this period is prehistoric; no evidence remains, save in some quaint pictograph or rudely graven image. There followed a period—shorter by far than the former one, though it endures—when the same birds awakened in other men an interest they could not excite in a savage breast, and the sense of beauty was felt. Use and beauty! What may not spring from such divinely mated pair, when once they brood upon the human mind, like halcyons stilling troubled waters, sinking the instincts of the animal in the restful, satisfying reflections of the man?

The history of American Ornithology begins at the time when men first wrote upon American birds; for men write nothing without some reason, and to reason at all is the beginning of science, even as to reason aright is its end. The date no one can assign, unless it be arbitrarily; it was during the latter part of the sixteenth century, which with the whole of the seventeenth, represents the formative or embryonic period during which were gathering about the germ the crude materials out of which an ornithology of North America was to be fashioned. As these accumulated and were assimilated—as the writings multiplied and books bred books, "each after its kind," this special department of knowledge grew up, and its form changed with each new impress made upon its plastic organization.

Viewing in proper perspective these three centuries and more which our subject has seen—passing in retrospect the steps of its development—we find that it offers several phases, representing as many "epochs" or major divisions, of very unequal duration, and of scientific significance inversely proportionate to their respective lengths. All that went before 1700 constitutes the first of these, which may be termed the *Archaic* epoch. The eighteenth century witnessed an extraordinary event, the consequence of which to systematic zoology cannot be over estimated; it occurred almost exactly in the middle of the century, which is thus sharply divided into a *Pre-Linnæan* epoch, before the institution of the binomial nomenclature, and a *Post-Linnæan* epoch, during which this technic of modern zoology was established—each approximately of half a century's duration. In respect of our particular theme, the first quarter of the nineteenth century saw the "father of American ornithology," whose spirit pointed the crescent in the sky of the *Wilsonian* epoch. During the second quarter these horns were filled with the genius of the *Audubonian* epoch. In the third, the plenteousness of a master mind has marked the *Bairdian* epoch.

Clearly as the six epochs may be recognized, there is of course no break between them; they not only meet, but merge in one another. The sharpest line is that which runs across Linnæus at 1758; but even that is only visible in historical perspective, while the assignation of the dates 1700 and 1800 is rather a chronological convenience than otherwise. Nothing absolutely marks the former; and Wilson was unseen till 1808.

The Archaic epoch stretches into the dim past with unshifting scene, even at the turning point of the two centuries in which it lies. It is otherwise with the rest; their shapes have incessantly changed; and several have been the periods in each of them during which their course of development has been accelerated or retarded, or modified in some special feature. These changes have invariably coincided with—have, in fact, been induced by—the appearance of some great work; great, not necessarily in itself, but in its relation to the times, and thus in the consequences of the interaction between the times and the author—who left the science other than he found it. The edifice as it stands to-day is the work of all, even of the humblest builders; but its plan is that of the architects who have modeled its main features, and the changes they have successively wrought are the marks of progress. It is consequently possible, and it will be found convenient to subdivide the epochs named (excepting the first) into lesser natural intervals of time, which may be called "periods," to each of which may attach the name of the architect whose design is expressed most clearly. I recognize fifteen such periods of very unequal duration, to which specific dates may attach. Seven of these fall in the last century; eight in the three-quarters of the present century. We may pass them in brief review.

The Archaic Epoch: to 1700.

Mere mention or fragmentary notice of North American birds may be traced back to the middle of the sixteenth century; but, to the eighteenth, no book entirely and exclusively devoted to the subject had appeared. The turkey and the humming-bird were among the earliest to appear in print; the latter forms the subject of the earliest paper I have found, exclusively and formally treating of any North American bird as such, and this was not until 1693, when Hamersly described the "American Tomineius," as it was called. One of the largest, as well as the smallest of our birds, —the turkey, early came in for a share of attention. The germs of the modern "faunal list"—that is to say, notes upon the birds of some particular region or locality—appeared early in the seventeenth century, and continued throughout; but only as incidental and very slight features of books published by colonists, adventurers, and missionaries, in their several interests—unless Hernandez's "Thesaurus" be brought into the present connection. Among such books containing bird-matter may be noted Smith's "Virginia," 1612; Hamor's "Virginia," 1615; Whitbourne's "Newfoundland," 1620; Higginson's "New England," 1630; Morton's "New England Canaan," 1632; Wood's "New England's Prospect," 1634; Bayard Theodot's "Voyage," 1632; Josselyn's "New England Rarities," 1672—and so on, with a few more, sometimes mere paragraphs, sometimes a page or a formal chapter, but scarcely anything to be now considered except in a spirit of curiosity.

The Pre-Linnæan Epoch: 1700–1758.

(1700–1730.)

The Lawsonian Period.—It may be a *lucus a non* to call this the "Lawsonian" period; but a name is needed for the portion of this epoch prior to Catesby, during which no other name is so prominent as that of John Lawson, Gentleman, Surveyor-General of North Carolina, whose "Description and Natural History" of that country contains one of the most considerable faunal lists of our birds which appeared before 1730, and went through many editions—the last of these being published at Raleigh in 1860. The several early editions devote some fifteen or twenty pages to birds—an amount augmented considerably when Brickell appropriated the work in 1737. The Baron de la Houtau did similar service to Canadian birds in his "Voyages," 1793; but, on the whole, this period is scarcely more than archaic.

1730–1748.

The Catesbian Period.—This comprises the time when Mark Catesby's great work was appearing by instalments. "The Natural History of Carolina, Florida," etc., is the first really great work to come under our notice; its influence was immediate, and is even now felt. It is the "Audubon" of that time; a folio in two volumes, dating respectively 1731 and 1743, with an appendix, 1748; passing to a second edition in 1754, to a third in 1771, under the supervision of Edwards; reproduced in Germany, in "Seligmann's Sammlung," 1749–76. It was published in parts, the date of the first of which I believe to have been 1730, though it may have been a little earlier. Volume I., containing the birds, appears to have been issued in five parts and was made up in 1731; it consists of a hundred colored plates of birds, with as many leaves of text; a few more birds are given in the appendix, raising the number to 113. These illustrations are recognizable almost without exception; most of the species are for the first time described and figured: they furnish the basis of many subsequently named in the Linnæan system; the work was eventually furnished by Edwards with a Linnæan concordance or index; and altogether it is not easy to overestimate the significance of the Catesbian period, due to this one work; for no other book requires or indeed deserves to be mentioned in the same connection, though a few contributions, of somewhat "archaic" character, were made by various writers.

1748–1758.

The Edwardsian Period.—This bridges the interval between Catesby and the establishment of the binomial nomenclature, and finishes the Pre-Linnæan epoch. No great name of exclusive pertinence to North American ornithology appears in this decade. But the great naturalist whose name is inseparably associated with that of Catesby had begun in 1741 the "Natural History of Uncommon Birds," which he completed in four parts or volumes, in 1751, and in which the North American element is conspicuous. This work contains two hundred and ten colored plates, with accompanying text, forming a treatise which early ranks among the half-dozen greatest works of the kind of the pre-Linnæan epoch, and passed through several editions in different languages. Its impress upon American Ornithology of the time is second only to that made by Catesby's, of which it was the natural sequence, if not consequence. It bore similarly upon birds soon to be described in binomial terms, and was shortly followed by the not less famous "Gleanings of Natural History," 1758–64, a work of precisely the same character, and in fact a continuation of the former. Edwards also made some of our birds the subject of special papers before the Philosophical Society, as those of 1755 and 1758 upon the Ruffed Grouse and the Phalarope. It may be noted here that one of the few special papers upon any American bird which Linnæus published appeared in this period, he having in 1750 first described the Louisiana Nonpareil (*Passerina civis*). This period also saw the publication of part of the original Swedish edition of Peter Kalm's "Travels," 1753–61, which went through numerous editions in different languages. Kalm was a correspondent of Linnæus; the genus of Plants *Kalmia* commemorates his name; his work contains accounts of many of our birds, some of them the bases of Linnæan species; and he also published, in 1759, a special paper upon the wild pigeon. As in the Catesbian period, various lesser contributions were made, but none requiring comment. Thus Lawson, as representing the continuation of a preceding epoch, and the associated names of Catesby and Edwards in the present one, have carried us past the middle of the last century.

[To be continued.]

THE BROWN THRUSH.

(*Harporhynchus Rufus*).

THE brown thrush is a shy fellow, and the greatest quiet and patience are requisite, if one would observe him at his ease. His flight, as he passes from tree to tree, is a short, jerky flutter, and it is amusing to see him "pitch himself," so to speak, into a spruce. He will dash in among the boughs with a clumsy flutter, remain perfectly silent for a moment, then with a swift run he goes out to the very end of the branch, where he will oftentimes remain quiet for many minutes, apparently lost in contemplation of the view, from his airy perch. In action he closely resembles the mocking bird, possessing in common with the latter a remarkably sweet voice, which he uses in the most artistic manner. His favorite song times are in the early morning and evening (although he does not confine himself strictly to hours), the former being the boldest and continuing longer than at sunset. He will select some high perch on the tip of a spruce, or way up in some tall poplar, and day after day, from this vantage ground, you will hear him carol his favorite melodies. As a musician, he ranks with the finest in our woods. Would you hear him at his best, though, you must find him as he crouches close in to the trunk of some dark pine or hemlock, during the heat of the day. There, as he sits in the cool shade, you will hear him extemporize, very softly, as though talking to himself, but in such an exquisite strain, that you listen enraptured. One must be close to enjoy all this, as I doubt if his notes at these times could be heard at over twenty yards distance. His usual cry of *chek! chek! whew'o!* is most frequently heard at evening, as he fusses about, in search of a perch, on which to pass the night.

The bright, fresh colors of the thrush's plumage on his arrival, and before his "good clothes" have grown rusty with use, is shown in pleasing contrast with the rich green of the young grass as the sprightly fellow hops about the lawn. He rarely ventures far from the trees when hunting for food, and is ready on an instant's notice to flirt his long tail and flutter up among the boughs out of sight, generally keeping on the further side of the tree as you approach. He has a great habit of poking about the brier tangles, and, as a general thing, you are almost sure to find him there, along the edges of woods and in the hedges. These thickets and tangles are where he loves to build his nest, although he will sometimes select a location more exposed to observation. Still, you will often find it as above, in the very thick of the thorns and briers, snug and cosy and cool, a fit abode for the sly chap. Like the catbird, the flirts of his long tail frequently serve as an index to the state of his mind. Curiosity, for example, is expressed by a quick flip of the tail from one side to the other, as he clings to some trembling vine and peers out at you from under the leaves, fancying himself unobserved. Should he find that you have discovered him, he silently disappears; quietly, mysteriously he goes, without a sound, nothing to indicate his course but the vibration of the foliage or the quiver of an alder as he noiselessly threads his way through the maze of twigs underneath. This bird, with his curious ways, is a favorite of mine, and I heartily welcome his voice again as it mingles with the evening chants rising from field and forest in the early spring.

The gray of twilight is fading into dusk, and the shadows

are deepening among the shrubbery. Out on the hill an enthusiastic robin still lingers to finish his song, which is all the sweeter as it comes to our ears subdued by the distance and accompanied by a murmur of delight from the soft green leaves around us. The music ceases, and all is quiet save the *chek! chek! whew'o! chek! chek! whew'o!* of our thrush as he calls good-night to us from the valley below.

WILMOT.

NEW YORK CITY.

THE GRIZZLY BEAR IN LABRADOR.

Editor Forest and Stream:

The reading of Stearns's "Natural History of Labrador" reminds me of the fauna of that almost unknown land as described by John McLean, in his notes of a twenty-five years' service in the Hudson's Bay Territory. Obeying the orders of Sir George Simpson, he went as a discoverer from the southeast shore of Hudson's Bay and established a fur trading post at the most northern point of the peninsula at Ungava Bay on the south shore of Hudson's Strait, and this is the way he writes of the fauna of that country where he lived for three long years, two of which the Hudson's Bay relief ship, from England, failed to reach him with supplies:

"To enumerate the varieties of animals here is an easy task. The extremely barren nature of the country and the severity of the climate prove so unfavorable to the animal kingdom that only a few of the most hardy species are to be found, viz., black, brown, grizzly and polar bears.

"Black, silver, cross, blue, red and white foxes.

"Wolverines, wolves, martins and beaver, but extremely rare here in the North.

"Otters, minks, muskrats and ermine; Arctic hares, rabbits, reindeer and the lemming."

The skins of all these animals Mr. McLean collected during his three years' life at the Ungava station, for the benefit of the Hudson's Bay Company. Speaking of the grizzly bear (*Ursus horribilis*), Mr. McLean remarks: "When we consider the great extent of country that intervenes between Ungava and the plains of the Far West, it seems quite inexplicable that the grizzly bear should be found in so isolated a situation and none in the intermediate country. The fact of their being here, however, does not admit of a doubt, for I have traded and sent to England several of these skins from the region of Ungava and many more from the eastern slope of the Rocky Mountains years before. Some time since I called the attention of the late Mr. Mittleberger, of this city, to this fact. He assured me that the grizzly was found in Northern Labrador. Mr. M. had been for a long term of years a factor in the employ of the Hudson's Bay Fur Company, and during this period had traveled over the largest portion of their possessions, handling every kind of fur animals, and was thoroughly acquainted with the fauna of the country."

DR. E. STIRLING.

CLEVELAND, O., April 24.

BIRD MIGRATION.

Editor Forest and Stream:

I inclose report of bird observations during April. The yellow-bellied woodpeckers reported were two males taken at one time, and are the only specimens we have taken, or known to have been seen here in six years, although they were formerly tolerably common.

T. V.

April 6—Brown creeper (*Certhia familiaris*).
April 10—Fox sparrow (*Passerella iliaca*).
April 11—White-throated crown sparrow (*Zonotrichia albicollis*).
April 12—Wilson's snipe (*Gallinago wilsoni*).
April 13—Golden-crested kinglet (*Regulus satrapa*)—only males.
April 14—Hermit thrush (*Turdus pallasi*).
April 14—Winter wren (*Anorthura troglodytes*).
April 17—American widgeon (*Mareca americana*).
April 17—Yellow-bellied woodpecker (*Sphyrapicus varius*).
April 17—Bufflehead duck (*Clangula albeola*).
April 26—Ruby-crowned kinglet (*Regulus calendula*)—males only.
April 30—Golden-crested kinglet (*Regulus satrapa*)—females only.

S. R.

April 6—Purple finch (*Carpodacus purpureus*).
April 7—Killdeer ring plover (*Ægialites vociferus*).
April 9—Chipping sparrow (*Spizella domestica*).
April 10—Carolina dove (*Zenaidura carolinensis*).
April 10—Bay-winged bunting (*Poœcetes gramineus*).
April 14—Cooper's hawk (*Accipiter cooperi*).
April 14—Great-crested flycatcher (*Myiarchus crinitus*).
April 14—Golden-winged woodpecker (*Colaptes auratus*).
April 18—Purple martin (*Progne subis*).
April 19—White-bellied swallow (*Tachycineta bicolor*).
April 20—Loggerhead shrike (*Lanius ludovicianus*).
April 24—Barn swallow (*Hirundo horreorum*).
April 24—Golden-crowned thrush (*Siurus auricapillus*).
April 24—Swamp sparrow (*Melospiza palustris*).
April 25—American bittern (*Botaurus lentiginosus*).
April 26—Virginia rail (*Rallus virginianus*).
April 26—Carolina rail (*Porzana carolina*).
April 28—Sparrow hawk (*Falco sparverius*).

LOCKPORT, N. Y., May 2. J. L. DAVIDSON.

USURPING SWALLOWS.—At home in Texas where we only see the white-bellied swallows during the migrating period, gracefully skimming along the ground, we consider them beautiful and innocent birds. I, however, have seen them in their true colors, and they really surprised me, they are such vicious little pugilists. Two weeks ago a pair of bluebirds took possession of a little cot, where, until this morning, they have lived in perfect happiness; but the usurper of this domestic bliss was at hand in the shape of a white-bellied swallow. This morning, while reading the FOREST AND STREAM, I noticed a pair of swallows circling over the cot, and at each approach the bluebird quailed. I paid no attention to it, nor did I notice them again till a great commotion drew my eyes from my paper toward them. Judge how surprised I was when I saw the male swallow take the bluebird fiercely by the throat and thrash him unmercifully. The poor bluebird seemingly made no resistance; still he did not seem inclined to give up. Finally, however, superior strength conquered, and he tottered away. The swallow immediately took possession of the cot, and very soon afterward was joined by his mate.—NEMO (of Texas), (Franklin, Mass.).

HARBOR SEAL.—By a slip of the pen *Phoca grœnlandica*, instead of *P. vitulina*, was given as the specific name of the harbor seal, mentioned in a recent note on its occurrence in Lake Ontario.—C. HART MERRIAM.

ARRIVALS AT THE ZOOLOGICAL GARDEN, CINCINNATI, UP TO MAY 1.—Bred in Garden—One jaguar (*Felis onça*), one bonnet monkey (*Macacus radiatus*), one axis deer (*Cervus axis*), one pony (*Equus caballus*), one cut-throat finch (*Amadina fasciata*). Donated—Two wood hares (*Lepus sylvaticus*), eight red foxes (*Canis fulvus*), one Canada porcupine (*Erithizon dorsatus*). Captured in Garden—Three cardinal grosbeaks (*Cardinalis virginiana*), one song sparrow (*Melospiza fasciata*), ten snowbirds (*Junco hyemalis*). Received in Exchange—Three European lapwings (*Vanellus vulgaris*). Purchased—One wildcat (*Lynx rufus*), two prairie dogs (*Cynomys ludovicianus*), one macaque monkey (*M. cynomolgus*), one white-collared mangaby (*Cercocebus collaris*), two moustache monkeys (*Cercopithecus cephus*).

Game Bag and Gun.

MY FIRST "HONKER."

I WAS born a sportsman. Nay, I am not quite sure that I had not a gun in my hand when my eyes first opened to take in the glories of this mundane sphere. I have been in the school-room or college halls all my life, either as student or instructor, and make it an object always to spend my vacations in the forest or by the stream, save and excepting only an occasional trip to the sea coast or shore of some sequestered lake, on whose bosom float in serene quiet myriads of water fowl, or from whose waters I may draw the finny beauties. To-day, in my forty-sixth year, I stand more erect than nine-tenths of city youth, and have infinitely more elasticity in my anatomy. Health vigorous, appetite good, eye keen, hand steady, mind active and intellect clear, while many of the companions of my boyhood are crawling round in the iron grasp of dyspepsia, with mind and body prematurely old. I need not tell the sportsman the reason of my elasticity of mind and body, or the cause of my friends' despondency, but lest some reader should accuse me of egotism let me say that I throw care to the winds and gather fresh life by forest and stream as each succeeding year rolls by.

How I pity the man who has none of the instinct of the true sportsman in his composition. Nature's true noblemen are they who are found regularly at the appointed season with rod and gun in hand, following the chase or plying the gentle art. You can rely on such a fellow wherever you meet him, and go your bottom dollar that he will prove a friend "tried and true" in any emergency. He shoots, not to kill and destroy, but for the pleasure and health it affords, and is content to let a few birds escape that the coverts may be well stocked another season, and takes more delight in exhibiting half a dozen two-pounders in his basket than the trout hog does in telling of the thousands he has slain, perhaps with only the weapon used by Samson of old when he mowed down the Philistines. The true sportsman is the most unselfish being in existence, I care not who may say to the contrary. He is fond of solitude because he loves to hold converse with nature in her softest as well as in her sternest mood, and finds a host of advisers and instructors in the world of animate and inanimate nature round him. He is never solitary for the simple reason that he never feels himself to be alone. *"Nunquam minus solus, quam cum solus."*

But I must back to myself again. Yesterday I packed "Daisy" away in her case well oiled and clean, bade her an affectionate good-bye until next season opens, and promised to look right well after her safety during her rest. A host of recollections came trooping in as I sat down after my labor of love was completed, and I determined to write up at least one incident for my favorite journal ere another sun had set.

"My First Honker"—Well do I remember the morning on which he measured his length on the grass and flopped his life out in vain attempts to rise in air. Ah, he must have been indeed a sad rake in his day, leading his harem forth to pluck up and destroy the wheat crop of the Sacramento Valley, but he proved a "tough cuss" when brought to the table, despite his twenty pounds of flesh. Some two days after the little "racket" with the boys on that snipe hunting expedition, getting an early start Jim and I found ourselves about 8 A. M. running our skiffs side by side up a narrow channel among the tules, now and then dropping the paddle to pick up the gun and drop a mallard as it rose quacking, or a bright-winged teal as it shot past with arrow-like speed.

After proceeding some three miles in this way we hauled up our boats on the levee and leaning on our arms took in the scenery and arranged for the evening sport. Just then a flock of "honkers" hove in sight, bearing directly down on us. Dropping to the ground we watched their approach with keen delight, our dexter fingers playing nervously with the triggers, at least mine did; for, dear reader, I had yet to bring down my first "honker," and if you have been there yourself you can appreciate my position. On they came, bearing swiftly down—honk, honk, honk—surely we will have a shot, that leader must be mine. "Jim, my boy, leave him to me," I said. "All right," and it was agreed upon. Fancy our disgust as they were seen to bear off to the left and pass us at about 200 yards distance, flying low and evidently bent on some feeding spot not far away. Rising again to our feet we watched their flight, and with something like satisfaction saw them lighting at about three-quarters of a mile to the eastward.

"Now, Professor," said Jim, "if you want that old chap, be off, make straight for that there high bunch of tules, crawl low then, and I think you will get him."

Off I went right briskly, notwithstanding heavy gum boots, and on approaching the bunch of tules found that I had to lie low to escape observation. However, this was no inconvenience. I had graduated in crawling long before I saw the Pacific coast, but before I had gone twenty yards found my progress stopped by a deep gut, about five feet across. Cautiously putting down my leg I found that the bottom must have dropped out, at least I could not find it, and as standing up to leap across would spoil my chance of a shot, nothing remained but to crawl along and find a crossing place. I squirmed around for nearly a hundred yards and found a place that seemed all right. Reaching over, gun in hand, I threw my weight forward, and just as I attempted to draw my legs after my body, which my right hand and gun had preceded, the treacherous "other side" gave way and down I went up to the ears in mud and slush. This mishap did not dampen my ardor, on the contrary, it added to my determination to bag that leader, who was standing so boldly up, keeping watch scarce 300 yards away.

Shaking myself as I emerged from this involuntary bath, I renewed the snake-like proceedings, lying low until I reached the bunch of tall grass that had screened me from the flock. What was my annoyance to find that instead of being only 50 or 60 yards from that old gander I was between 80 and 90. Eighty-three paces it proved to be, as I stepped it afterward. But the mind quickly makes a decision in such a case. Drawing my No. 4 shell, I replaced it with a brass one carrying 4 drams of Hazard's No. 3 and 1¼ ounces of BB. This in my left barrel I felt confident would not fail me. Then rising I gave the old fellow the contents as he spread his wings for flight, and to my intense delight over he rolled at my service. Did I fire the right at the flock? you ask. No, I did not, for the simple reason that they were over 100 yards distant, too far to kill with certainty, and I never shoot to wound or cripple if I can help it. I would rather miss half a dozen outright than wound one, to crawl away and die in agony. Did I "talk right out in meetin'?" Yes, brother sport, I did. I went into a committee of the whole then and there and gave myself a unanimous vote of thanks, which was modestly received and becomingly acknowledged, after which I took that old "honker" by the neck and, throwing him over my shoulder, wended my way back to the spot where Jim stood waving his hat in congratulation. I meditated, too, as I walked; but that wetting did not trouble me much. True, I was scarcely dressed to suit company, but then I was jubilant, and I fully realized the fact that I had killed "my first honker." I have killed many since then, but none afforded me so much real zest as did that old fellow among the tules of the Sacramento.

I have been much interested of late in the articles on the "Choice of a Hunting Rifle" and "The Performance of Shotguns." My favorite gun is a 10-bore, 30-inch barrels, 9 pounds. This I find will do all that can be reasonably expected. I use 4 drams best powder and 1¼ ounces shot—No. 4 for geese, No. 6 for ducks, No. 8 for quail and doves. I can kill my bird clean at fifty yards with average certainty, and I am content. My favorite rifle is a Winchester, 24-inch barrel, .44-caliber, full magazine. I do not want a better weapon for mountain work. I believe the 30-inch barrel gives greater accuracy at long range, but the 24-inch is handy.

I will tell you how I killed my first buck ere long; and as "The Professor" is too long for a *nom de plume*, will in future subscribe myself LEONIDAS.

THE ST. CLAIR FLATS BILL.

Editor Forest and Stream:

The question of the status and disposition, of the chief and choice part in United States waters, of that famous shooting territory, usually denominated the St. Clair Flats, is before Congress and likely to be finally determined, and a few words to you about the matter will not be out of place.

Some two years since a bill was introduced in the last Congress to authorize the Commissioner of the General Land Office to sell the same district as United States overflowed and unsurveyed lands, the possession of which was sought by some wealthy parties, the territory having become both very desirable and valuable.

The move was observed by a citizen of Michigan, who takes interest in public affairs, and set down by him for further attention. The matter apparently attracted neither comment nor even notice during several weeks which went by, when he, deeming it a doubtful policy and unjust to detach this large and noble shooting territory from the people's domain and constitute it a close, private shooting preserve, to their perpetual exclusion from all privilege therein in the midst of a public water, their constant resort, drew an earnest protest or petition against the measure, setting forth in terse and pointed statements the merits of the case, and the same was widely circulated, and signed by thousands of citizens from Detroit to Iowa and Port Huron, and then forwarded to Members of Congress. Numbers of influential citizens rendered aid, Members of Congress were conferred with and interested, and influence assured. Don M. Dickinson, a noted lawyer and politician of Detroit, appeared before the committee having the bill in charge and made protest against its passage in the interest of private claimants (himself one of them), to the same territory, a matter which somehow did not obtain publicity. The bill never passed from the hands of committee.

It may be related here that until very recently the fact of there being private claims of ownership of the overflowed and marsh district in question was little, if at all, publicly known or heard of, prominent local citizens and public men and active supporters of the bill above referred to not knowing anything of the same. However, I do not state this to assert that such claims had not already been born or made a manifest of life.

The citizen above cited as organizing opposition to the bill described, proposed to two or three different Members of Congress the plan to set the territory in question aside for the people, and suggested the merits and advisability of considering and perhaps inaugurating a like procedure with like Government territory generally, but somehow they failed to discern the magnitude of the cherished interest which exists in this field and its valued relation to a large mass of the people. Some political cigar, perhaps well lighted but of transient and comparatively insignificant importance, as appointments to office, seemed to take precedence and monopolize their attention, and they gave no sign of regarding such really national interest as possessing even importance.

The bill had fallen, but the individual mentioned, fully realizing that the St. Clair Flats would ere long in some manner be grasped by private interest and the public cease to have any rights therein if no permanent bulwark of protection was interposed, now advocated the setting aside of that territory by Congress as a national preserve for the people. Believing efficient game protection compatible with a system of national preserves, and deeming it a hardship and an injustice and a matter that in the future will be most aggravating in effect to have the extensive shoal water and marshy margins of Government waters detached from the people's domain and created close private shooting preserves, to the perpetual exclusion of the people from all right therein, the policy of setting aside such Government territory in the future for the people and the efficient protection of the same in all its interests by authority was urged. Indeed, to amplify in this view, it seems a rank impropriety for the Government, the people's instrument, created by them to subserve their wants and needs, to sell for a pittance, the benefit of which is not sensibly felt, these shoal-water districts, and shut the public out from the same forever, constituting as they do about the only territory for game preserves in the nation, and margining public waters to which the people habitually resort for health and pleasure—boating, fishing and hunting. The people, ever having been used to almost unlimited freedom in sporting fields, appear to have failed to discern the rigid enthrallment of these privileges which is fast approaching, but they will very soon see its lines and feel its bonds, when their neglected and lost interest will be irreclaimable.

The public interest in this field and the above views relative to the same were brought earnestly to attention in high quarters in the Government and received consideration and a friendly recognition. Events in their course finally led to the preparation of a bill to set aside the unsurveyed and overflowed and marsh lands of the St. Clair territory as a national preserve, and an understanding that the measure should be presented in Congress.

The looking up of the data essential to the describing and bounding of the territory to be set aside furnished a peculiar experience. The General Land Office was applied to and

directed the request to be made to the Chief of Engineers, who furnished a U. S. Government chart as the sum of its ability to contribute in this line, and the Land Office at Detroit, after long delay, reported that it had nothing which would be of help in the matter. The Government chart, of course, is an accurate survey of Lake St. Clair and river, giving location and outline of the shores and islands and carefully everywhere the depth of water.

About the time these delays came to an end, the Hon. W. C. Waybury, member from the Detroit district, introduced two bills in Congress, the objects of which were to recognize and confirm title to private claimants to Harsen's and Dickenson's islands (excepting a trifling portion of one of the same) and to include extensive marsh, overflowed or shoal water territory adjacent within certain general bounds, the latter being defined under the head of natural and alluvial accretions.

The claim to title in each instance dates back to the days of English dominion, no part of the land proper has ever been surveyed by the Government save a portion of Harsen's Island, and to the same surveyed portion the United States long ago confirmed title.

The territory included by the claims set forth in the bills consists mainly of overflowed lands, and has an area of over fifty square miles. It comprises the main bulk and the very cream of the world-wide famous shooting territory in United States waters, known as the St. Clair Flats. As is generally known, parties resort thither for shooting from the Atlantic cities to the Mississippi, and it is a possession sufficiently desirable to excite great temptation for its acquisition.

There are several notable things to be taken into account relative to the matter. The claimants are plainly asking for that which they haven't got—title; and an interest in and claim to the territory on the part of the United States is recognized to exist in the asking for the relinquishment of the same. The overflowed territory has, beyond question, largely taken on its shoalness since the claims set up profess to have been founded, and at which date it is not probable there was any thought of the same being included in the claim. Everything assures that Lake St. Clair itself will eventually fill up and become land, save the river channels; it is but a shoal water anyhow, and if this claim can be allowed in its full extent, it is difficult to see where boundaries may not extend or be set up. The United States waters of Lake St. Clair proper attain to a depth of eighteen feet only over a very limited surface, and nowhere to over twenty-one feet, and in its Canadian portion nowhere attains to twenty-three feet. Large areas have a much less depth and rushes rise freely above the water.

Besides the above two bills of Mr. Maybury relative to this territory, one has been presented by Senator Palmer, of Michigan, to have the entire United States marsh and overflowed lands within and bordering Lake St. Clair and the divisions of the St. Clair River set aside as a national preserve for the people of the United States, subject to such regulations as may be provided, thus removing it from the grasp of private parties and ownership. This measure seems eminently an act of justice and a tribute to public rights, and if carried out will probably lead to the institution of an effective game protection over the region, and all like preserves, if such shall be instituted hereafter. A petition (a copy of which I inclose to you) in support of this bill was drawn and has been extensively circulated and signed in the cities and villages of Michigan, not one citizen in a hundred being found who is not in favor of it. The foremost citizens and best minds, wherever attention has been called to the matter, not only generally, but almost without exception, express decided approbation of the measure, and many leading citizens are lending active aid.

Also, this matter is one of national interest, and expression respecting it is properly in order from any State in the Union; the bill deals with national territory only, and for a common or national purpose, and petitions for signature have been sent to several States.

PETITION:

ASKING CONGRESS TO SET ASIDE THE UNITED STATES OVERFLOWED AND MARSH LANDS OF LAKE ST. CLAIR AS A PRESERVE FOR THE PEOPLE.

To the Hon. Senate and House of Representatives of the United States:

Whereas, A bill was introduced in the last Congress to enable the United States Land Commissioner to sell the extensive marsh and overflowed or shoal water lands in the United States waters of Lake St. Clair, which lands are one of the most notable resorts for shooting and fishing in the nation and most highly esteemed for the same, the purpose of the bill being to enable private parties to become the owners of this large territory and make the same a close private shooting preserve to the exclusion of all right and privilege of the people therein, which bill was not perfected by congressional act; and

Whereas, two bills have been introduced into and are being considered by the present Congress, the purpose of which bills is to give title and ownership of the greater and most valuable part of the territory above described to private and interested individuals upon plea of old time claims to contiguous islands, which claims profess to have been founded in the days of English rule; and

Whereas, title to the islands proper, if established, should not convey ownership of the many miles in extent of adjacent marsh and overflowed or shoal water lands, which also represent much financial value and present great temptation to private greed for their possession; and

Whereas, the bills introduced to give and confirm title to the aforesaid claimants admit a claim to the territory in question to be existing on the part of the United States;

Therefore, we pray you that no title pass or be confirmed which is not unmistakably demanded by indisputable legal right and justice, and that the United States unsurveyed marsh and overflowed lands of Lake St. Clair and bordering the divisions of the St. Clair River, be set aside permanently as a National Preserve in common for the people of the United States, subject to such regulations as may be established by rightful authority.

And further, we earnestly deprecate the policy which is being extensively practiced, of Government's selling the shoal water and marshy margins of our Great Lakes and other Government waters—the peoples' patrimony—to private parties, to be converted by them into close private shooting preserves to the perpetual exclusion of the people in common therefrom, which restriction and monopoly will, in the future, be deeply felt as a standing public aggravation and outrage of magnitude, and is contrary to both good public policy and justice; such favorite grounds for game and shooting throughout the nation are fast passing, and largely have already passed, to private ownership and control; *Therefore*, we express our belief that Congress should allow such proceeding to go no further, but should set aside such territory as a preserve in common for the people, subject to appropriate and efficient provisions and regulations.

Further, Mr. Maybury, who presented the bills for the private claimants, has also recently prepared another bill for the purpose of setting the same territory aside as a national park and game preserve, placing it under charge of the Secretary of War, but is not expected to present the same until the committee having charge of the bills for private claimants have expressed their views respecting the same.

The State of Michigan has also appeared in the case as a claimant to the St. Clair territory in question, under the Swamp Lands act of Congress relating to a class of United States lands in the State. It sent one of its ex-Congressmen, Mr. McGowan, to Washington to look after the State's interest in the matter. He is reported—no doubt correctly—as having advised that the General Land Office pass upon the question of ownership, and if the United States is adjudged the owner, let Congress have a survey made and the lands sold, he evidently having embraced the whole matter with a very ordinary view. It is reported later that the State authorities at Lansing are preparing papers to forward to him showing the State's ownership of the lands.

There is no disposition on the part of the movers for a National preserve to deprive any one of legitimate private rights or show disrespect for the same. The move has proceeded upon the common public understanding, which fairly might be said to be universal, that the overflowed lands of Lake St. Clair belonged to the United States, such land, of course, being entirely legitimate and proper for such purpose. The prime movers in the matter had never heard of the claim of private ownership to this territory until Mr. Maybury introduced his bills in the interest of the same. Parties opposed the bill introduced in the preceding Congress to enable this shoal-water territory to be sold as United States unsurveyed lands, and conferred with different members of Congress respecting the same, and yet never heard of such private claims until Mr. Maybury's move.

Private claims to land of the islands proper which ought to be respected may be shown, and if so, say all let them so be. Title to the islands proper, it is claimed, carries the same right to this many miles of overflowed shoal water territory, the most of which you can sail a boat over. This claim should not be granted because the same is asked for. It should never be conceded except after the most thorough scrutiny determines that justice unmistakably demands the same.

The islands proper, in question, were not deemed essential in the plan for a national preserve. It seems like a most liberal stretch of credulity to contemplate that this large, overflowed territory should pass upon the claims set up, when the case is fairly and fully scrutinized.

Able efforts by able counsel have been made before the committee for the claimants, and it is due the people that both sides be thoroughly presented, as no doubt will be done, and then let Congress give a fair decision, dictated by intelligent justice.

MICHIGAN, May 12.

THE ADIRONDACK BILL.

THE text of the Adirondack bill passed by the Albany Legislature is as follows.

SECTION 1. Within ten days after the passage of this act the Governor, by and with the advice and consent of the Senate, shall appoint a suitable person, who shall be a resident and citizen of this State, as Commissioner, who shall be known as the Forest Commissioner of the State of New York. Said Commissioner shall hold office for six years and until his successor shall be appointed and confirmed by the Senate. The said Commissioner shall receive an annual salary of $4,000. Neither said Commissioner nor his subordinates shall be liable to any person or corporation for any damages sustained by reason of want of repair of any road or bridge situated upon the forest lands of the State. Said Commissioner shall have an office in the new Capitol in the city of Albany, where all the records of said Commissioner shall be kept.

SEC. 2. It shall be the duty of the said Commissioner to cause all the forest lands now owned or which may be acquired by the State to be located, and, when necessary, to be surveyed; to procure suitable books of record and cause all said lands to be recorded; to make and publish such reasonable rules and regulations for the use of said forest lands by the public as shall give the greatest amount of liberty in the use thereof, consistent with the preservation of the forests thereon; to prevent trespass upon the said lands and streams situated thereon; to make reasonable regulations for the prevention and extinguishment of fires thereon; to prevent overflow of lands belonging to the State by the erection of dams and obstructions hereafter built or made in the streams within said boundaries; to report to the Legislature on or before the fifteenth day of January in each year his official action during the preceding year, and such information as may be useful in preserving the forests upon State lands and the forests of the State generally, and maintaining and preserving the supply of water derived therefrom; and also to report generally upon the subject of forest preservation and the utility thereof in its scientific aspects; to report to the Attorney-General trespassers upon said land and streams and furnish to him the evidence thereof. Said Commissioner shall not grant to any person or class of persons or corporations any exclusive use of any portion of said forest lands or any lakes or rivers thereon.

SEC. 3. The Attorney-General shall, upon the report of the Forest Commissioner, commence actions in any court having jurisdiction against persons who have committed trespass upon forest lands of the State, to recover the penalties prescribed by this act, or for any cause of action the people may have against such trespassers. In any action brought by the Attorney-General, under this act, an injunction may be granted upon the application of the Attorney-General restraining any act of trespass, waste, or destruction, and in cases where lands belonging to the State within said boundaries are being injured by the maintenance of any dam or obstruction which may hereafter be erected in any stream or lake, the court may order the removal or partial removal of said obstruction during the pendency of said action, provided that the owner of such dam or obstruction shall not be deprived of any legal or equitable right to damages for such removal.

SEC. 4. The said Commissioner shall have power to appoint such foresters as he may deem necessary, not exceeding ten in number, at salaries not exceeding $600 each per annum, and such clerks as he may deem proper, within the limits of the appropriation made by this act.

SEC. 5. Any person or corporation who shall cut, or cause to be cut, any tree or timber standing upon the forest lands of the State, with intent to remove the same, or any portion thereof, or bark therefrom, shall forfeit to the people of the State of New York the sum of $10 for each tree so cut, to be sued for by said Commissioner.

SEC. 6. Whenever the State owns an undivided interest with any person in any forest lands, or holds or is in possession of any such real estate as joint tenant or tenant in common with any person, within this State, who has an estate of freehold therein, any such person may, upon obtaining consent in writing of the Comptroller thereto, maintain an action for the actual partition of said property according to the respective rights of the parties interested therein, in the same manner as if the State were not entitled to exemption from legal proceedings and with the same force and effect as in other cases, except no costs shall be allowed to plaintiff therein, and no sale of said lands shall be adjudged in said suit.

SEC. 7. The sum of $20,000, or so much thereof as may be necessary, is hereby appropriated out of any moneys in the Treasury not otherwise appropriated, for the purposes of this act, payable on the warrants of the Controller to the order of the said Forest Commissioner.

SEC. 8. This act shall take effect immediately.

MASSACHUSETTS GAME INTERESTS.

ON Friday evening, the Massachusetts Fish and Game Protective Association held a very successful and enthusiastic meeting. Five new members were received, and the attendance was the best for a long time. The meeting was the last of the season, but it was decided to come together again in the fall earlier than usual. Several new and very important committees were appointed, some of which may strike poachers and law breakers with surprise.

The matter of the defeat of the game law, which was to have been generally adopted in New England, was discussed, and it appears that the stupidity and the cupidity of the country member had much to do with the defeat. Two clauses in the bill, both of minor importance, appear to have weighed heavily on the mind of the member from the rural districts, and together with the force of the market element, the bill was killed. The obnoxious clauses in the bill were the ones relating to "shore birds" and to killing birds in certain ponds in the State. Evidently the country member desires to shoot ducks and geese on the shore at all seasons, and means to have all there is left of migrating waterfowl which are accustomed to stop to rest in Massachusetts ponds.

A member from among the marketmen claims that there is an improvement going on among the game dealers, and, honest and earnest himself, he will labor in that direction, and hopes that, at least, his fellow-dealers will not meet the bill another year with organized opposition. It is also very gratifying to note that several of the lobster dealers, seeing the depletion so rapidly going on in these valuable shellfish, have declared themselves in favor of stringent protection and promise to aid in securing legislation in that direction.

The game bill came up in the House at a very unfortunate time—during the unavoidable absence of its best friends and defenders. But its loss for one season has not disheartened them in the least. Mr. John Fottler, President of the Association and than whom no man in the State has labored more earnestly for game protection and for this bill, at the time it came up in the House was performing the mournful duty of burying his business partner. All the best friends of the bill at the State House happened to be away, and consequently when the measure was attacked by its enemies, present in full force, there was nobody to defend it.

Commissioner E. M. Stillwell of Maine, says that he is not at all surprised at the defeat of the Massachusetts bill. In fact he rather expected it. His experience with the obtaining and enforcing of the excellent law in Maine has shown him the fighting qualities of the poacher and market hunter. He regards the defeat this year as but one of the drawbacks which will probably lead to success next winter. He expects a fight in his own State then, and dreads the influence of the Boston game dealers more than any other force. But efforts are already begun for the early passage of the Massachusetts bill in this State, and as the Maine and Massachusetts Legislatures next meet at the same time, the game dealers will have a double enemy to fight. Earnest work will be put in by the Massachusetts Fish and Game Protective Association, and the ultimate success of the New England protective bill without essential modifications is confidently expected. The Commissioners of the other States are neither alarmed nor discouraged at its defeat this year in this State, but will labor for its enactment at home.

BOSTON, May 18. SPECIAL.

SEA OTTER SHOOTING.

EMERGING from a nest of low sandhills, covered by stunted hemlocks and dwarf cedar, the grand Pacific Ocean, with its continuous line of white breakers extending as far as the eye could reach north and south, presented a glorious view. It was just one mile to the first breaker, directly across a stretch of level sand beach, where the lookout or derrick was stationed. A derrick is mounted on three legs, like a tripod, with an open box 4 feet square inclosed on three sides, shore side open, the upper edge of the box being cushioned for gun-rest. The box is supplied with low stools for the hunter. The derrick is 30 feet high, and placed on a line of about half tide. I take a glance at the weather vane—wind in the sou'west, good; tide coming in, better; sky clear, correct. These different conditions of wind and tide have to be closely observed to insure the drifting ashore of the otter when shot. A nor'west wind is as good as one from the sou'west quarter, but it seldom occurs in this section of country. The guns used are Sharps rifles, 12 to 16 pounds weight, .44-caliber, using from 100 to 120 grains powder and 450 to 550 grains lead, bottle-necked shells, perfectly smooth, square-butt, naked bullet. A Rocky Mountain rear sight is used with a globe sight in front, the globe being about one inch long, with pinhead. There is considerable inquiry among the otter hunters in regard to new guns, as their Sharps rifles are wearing out and they cannot secure more; the Ballard seems to be the favorite. A wooden step is made for each distance of 100 yards and laid in rotation for instant use, to avoid mistakes or confusion.

In twenty minutes we were on the derrick, glasses in hand. An otter was discovered diving for crabs. He soon came up with a large crab in his little, squirrel-like front paws, and lying on his back, with head erect, proceeded leisurely to eat it. In an instant the 700-yard sight was adjusted, the 16-pounder spoke, and a 550-grain bullet was landed three feet to windward. A good horizontal line shot. The distance was correct, but the wind not carefully noted, which was from the 10 o'clock quarter, the otter at 12 o'clock and the shooter at 6 o'clock points. In about a minute the otter appeared at the 1 o'clock point, about 100 yards to windward; the same sight was used, and at the second shot the otter turned "back up," head and flippers down, and began drifting ashore dead. It proved to be a fine silver-tipped, and $100 was received for its pelt on the beach.

It must be remembered that sea otter shooting is attended with many difficulties, viz.: All shooting must be done from 400 to 1,000 yards over the water. Generally there is a heavy ground swell, and there is more nice calculation in making a shot of this kind than the reader would naturally suppose. First you have to calculate on the force of the wind, distance, rise and fall of the otter, and last, but not least, this calculation has to be made in a moment.

TILLICUM

GRAY'S HARBOR, Wash. Ter.

FISH AND GAME IN BRITISH COLUMBIA.

As many of your readers visit the far West in quest of sport with rod and gun, perhaps a few might extend their trip to this far western isle, if they but knew the sport to be obtained in our mountains, valleys and rivers. Deer are plentiful within a few hours' drive of this city, and in the open season dozens of fine carcasses are brought in weekly to our market. Bear (black) are also plentiful, and on the mainland of the Province, but further north than this, grizzly are to be found, and I am informed that on the banks of the Skena River they are very numerous, as also game of all kinds. The game birds of the island are grouse (blue and yellow) quail, ducks and brant. Grouse are very plentiful, and good bags are made by our local sportsmen in the neighborhood of the city. Quail are abundant, and do not suffer from our winters, which are very mild. On all the rivers and creeks, bays and inlets, mallard, teal, butterball and brant, abound in large numbers. Not being much of a shot, and caring very little for packing a gun all day, I may not do this part of my letter the justice it deserves, but all that I have stated I know to be facts.

In a radius of fifteen to twenty miles from this city we have a number of small lakes called Prospect, Pike, Long, Thetis (little and big), Langford, Elk and Beaver, in all of which trout are abundant, and in the summer take the fly freely, in fact, they have been biting in Prospect Lake for the past three weeks or more, and some very fair bags have been taken (say fifty between three rods) They were taken with bait, but "oh shame, oh sin, oh sorrow," they were taken with salmon roe, which is not prohibited by our game laws But the fishing in these lakes is tame compared with that in the Cowichan and Comou rivers further north, on the eastern side of the island, and in nearly all the rivers and creeks of the mainland trout are plentiful and bite freely, and are said to go as high as six pounds in weight. Last summer myself and a friend paid several visits to Pike Lake, and caught 15 to 25 each, weighing from ¼ to 1¼ pounds, on each trip, fishing from the bank, and now we look forward to renewing our acquaintance with the fish of Prospect, Pike and Long lakes.

Salmon are about us in untold numbers, but, sad to say, they will not rise to the fly; but our Indians catch them with hook and line in salt water. From my residence I frequently see an old Siwash trolling for winter salmon, and he catches them, weighing from 16 to 20 pounds, with herring bait, and in summer they troll with spoon; but, so far, I have not heard of many white men even trying to catch them.

Should any of your readers visit this city for sporting purposes, they can outfit here at small cost, and obtain all the information they require at any of our sporting emporiums or by asking any of our sportsmen.

I may state that all the lakes I have named are accessible by horse and buggy, and the other points by steamer.

The mouth of the Frazer River is a favorite spot in the fall for ducks and brant. CANUCK.

VICTORIA, B. C., April 2, 1884.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

Your correspondent "G.," in issue of April 17, apparently brings up many objections to the repeater, and there have been so many adverse criticisms of the "deadly rifle" that I cannot but come forward again in defense.

Some of your correspondents appear inclined to be facetious, and others unnecessarily alarmed as to the rapid killing of game by the proposed hunting rifle. The latter mistake their premises; for which destroys the most game, the accurate and deadly rifle that secures its game at every shot, or the "wild shooter," that hits, but does not hit in a vital place, and leaves a wounded head of game to escape and die a lingering death, thereby destroying one head of game with no corresponding benefit to mankind?

I think I but voice the thoughts of all good hunters and sportsmen when I say that I decry the wanton killing or destruction of game as much as any one. But to kill game is one of the main objects of hunting, for I know of no one who will persistently hunt, simply for the health-giving exercise and recreation, and come home each day with empty bag. I do know a good many, however, and I do think true sportsmen can all be included, who like to hunt, not only for this reason, but for the sake of the game they kill, and who are satisfied to kill simply for their wants, or those of their friends, and not for glory.

Now what does any true hunter want to hunt with? Does he not want a true rifle that kills, and kills every time? Will such a hunter go on piling up meat and wasting or wantonly destroying game just for the sake of killing? With such a weapon will he not be satisfied with the one deer he kills, and leave all the rest for some one else, or for another day? Will he not be able to kill that one deer with less liability of damage to the multitude? Will he have to go on shooting at now this deer and now that, wounding all but losing them, and then by destroying perhaps ten deer for the one he finally brings to bay by some lucky shot, as would be the case if he had a gun that was not accurate? I think that "Nessmuk's" return to his beloved muzzleloader was just because he wanted the most deadly weapon he knew, for just such reasons as those above, having become disgusted with a murderous weapon, such as all poor shooting rifles must be.

Having seen so much of just such work as that indicated, by murderous rifles, I among the first proposed the deadly rifle as a means of saving game. I have been sick and disgusted with the sight of wounded game escaping to die and benefit no one but the wolves, and I have longed for the time to come when sportsmen could get a rifle that would kill and not wound when they shot, although there doubtless are those who would abuse such a gun, and kill more than they needed just for the sake of killing, still I claim that in the great majority of cases good and not harm would result from the general introduction of the accurate rifles. Doubtless, also, game would still be wounded and escape at times, even with such a rifle in the hands of an expert; for luck, chance, or what not, might cause a bad shot to be made, but the proportion would be greatly lessened, and more game left uninjured and less be destroyed for the amount actually bagged.

All high trajectory rifles are murderous on game. They were never built or intended for hunting guns. As military rifles, to use against an enemy, to shoot long distances, and to wound or kill a human being, were and are their legitimate object. As such they are intended to be murderous, for "a wounded enemy is as good as three dead ones," and in battle the wounded and not the dead are what demoralize the line. But who wants to use such weapons against game? It is a lucky chance if the hunter can come on his game at a known distance, or have full time to estimate it and, with such a rifle, put his ball where he wishes. A shot too high, or too low, leaves his game with enough vitality to escape and leave him bootless, to linger and suffer and die, with only the wolves to rejoice.

I have been striving to obtain a rifle that shoots close enough to hit and kill whenever I shoot at any reasonable distance. I may find my game to-day at 50 yards, to-morrow at 150, and yet I want my rifle to shoot so flat that to-day, to-morrow or next day I can shoot with a certainty of killing and not wounding. I do not want to see a deer, an antelope, or any game go off on their legs, disappear with a wound anywhere, to leave me sick and disgusted with myself at the useless pain and death resulting from my bad shot. I go out to kill and not to destroy, and I am as sick of all the namby-pamby sentimentalism against killing game when needed as I am of all needless and useless suffering and death inflicted by murderous rifles.

But I hear the question, why should I want a repeater, when I want a gun that kills at the first shot? I answer, simply as a protection to game again, by giving one the ability to fire the second shot, and the third and the fourth if necessary, as rapidly as possible, should I by any chance fail to kill at first and thereby prevent this wounded animal from escaping. I would want the repeater as a reserve to fall back upon in cases of emergency, using it ordinarily as a singleloader and choosing my shots with it as carefully as though the one shot I had in the chamber was the one on which my life depended. It is admitted that in the hands of a nervous man, or perhaps in any one's hands under some circumstances, the repeater would be abused; but I claim a better state of affairs for the great body of sportsmen. It would be as well to condemn all horses because some are vicious and run away and smash things, as to condemn all sportsmen with repeaters because one loses his head and "throws I ad" hastily and indiscriminately.

Then again, in spite of the assertions to the contrary, in this Western country the hunter frequently takes his life in his hand while hunting. Heavy and dangerous game is not so scarce as some of your correspondents would seem to indicate, and I for one would not think of going into the mountains without being prepared to encounter ferocious and dangerous game. I might hunt for a month and never see a bear; but like the Texan and his six-shooter—when I did want a repeater "I would want it mighty bad." I have seen men of a party stop fishing and come to camp on account of the proximity of bear; and one can't tell in this country what he may find when he once is beyond civilization.

And even were I where I knew there were no dangerous animals, human or brute, I would still want the repeater, although of perhaps lighter caliber, for to me it represents the latest advance and development of firearms; and every hunter should have the best.

And now as to "G 's" criticism. He says repeating rifles are unreliable. Had he said some are so I would agree with him. But has he tried them all? Or has he seen the many improved weapons of late years all tried? His first experience was by his own statement "many years ago," and with the Winchester carbine. "Many years ago" I also owned a Winchester, and I found it unreliable and sold it, but I did not thereby lose all my faith in repeaters, nor condemn them as he now does after years have elapsed for improvement. First efforts are rarely successful, and a steady march of improvement for over three hundred years has developed our present breechloaders and repeaters from their prototypes of long ago. Breechloaders and repeaters are not a thing of to-day; but their development was slow until the introduction of the metallic cartridge, and since "many years ago" many and valuable improvements have been introduced.

Besides this, the Winchester is not the only nor the best repeater extant. Why do all refer to this as the one weapon of all on which to pin their faith or unbelief in repeaters? True it is, that it was one of the first and has led to many others, and is entitled to much credit, not only for its own excellencies, but for its good work; but also true it is, that other and better repeaters are to be had to-day, and steady improvements are being made by firms, who have new life and not the conservatism of the older gunmakers.

I cannot help but criticise "G.'s" ideas about caring for guns. The hunter, soldier or scout who does not keep his gun clean deserves to "lose his scalp" if "jumped by Indians or charged by a bad-tempered grizzly." He has about as much business anywhere near either as a first-class lunatic has out of his asylum, and such a man would probably "pass in his checks" at such a time, even if he were armed with the most perfect weapon under heaven and that in the most perfect order. After an experience of some dozen years in the camp and field, I have yet to see a similar experience to that he narrates with any class of weapons, either singleloaders or repeaters. My Winchester became unreliable because it was old and rickety, and even the best of weapons grow unreliable from such causes.

Again we have a man of the "didn't-know-it-was-loaded" class who wanted to hunt a grizzly alone. I wonder if he had ever seen one before the time mentioned, when he saw three? Lucky for him that he did not shoot at any of them—and more fool he for ever thinking of shooting at a cub unless he knew the she bear was away beyond ear shot. Had his gun even been in order, he would probably have had "his belly full" in no time. But what is one to think of any hunter, or any one else who abuses a gun in the manner described. Guns are made to use and use properly, the same as any other piece of mechanism. Governors on steam engines have broken down before now and the engine has "run away and smashed things," but are all steam engines unreliable on that account? Is the Winchester or any other repeating arm to be held up to ridicule because some one does not know how to use it? On the contrary, are there not hundreds, yes thousands, who use them, well aware that they are reliable—provided the "man behind the gun" is reliable too?

Then we are told also that repeaters are unsafe, and again because a cartridge in a Winchester magazine, one in a Hotchkiss and another in a Spencer ("G." makes it appear as a Winchester), exploded and tore things to pieces. "Accidents will happen, even in the best regulated families," but there generally is some preventable cause for each accident, and the fault in each of these cases was perhaps the fault of the man and not the gun.

I have the report of a board of officers before me, who in 1881 tested magazine guns with a view to their introduction as military weapons. Since then several new repeaters have been introduced, and that they were not tested was simply because they had not then been born.

It may be of interest to state what some of the "official tests" were:

III. *Endurance.*—Each gun to be fired 500 continuous rounds with out cleaning, using the magazine. The state of the breech mechanism to be examined at the end of each 50 rounds.

IV. *Defective Cartridges.*—Each gun to be fired once with each of the following defective cartridges: 1. Cross-filed on head to nearly the thickness of the metal. 2. With a longitudinal cut the whole length of the cartridge from the rim up, a fresh piece of white paper, marked with the number of the gun, being laid over the breech to observe the escape of gas, if any occur.

V. *Dust.*—The piece to be exposed, in the box prepared for that purpose, to a blast of sand-dust for two minutes; to be removed, fired 20 rounds, replaced for two minutes, removed and fired 20 rounds more.

VI. *Rust.*—The breech mechanism and receiver to be cleaned from grease, and the chamber of the barrel greased and plugged, the butt of the gun to be inserted to the height of the chamber in a solution of sal-ammoniac for ten minutes, exposed for two days to the open air, standing in a rack, and then fired 20 rounds.

VII. *Excessive Charges.*—To be fired once with 85 grains powder and one ball of 405 grains of lead; once with 90 grains powder and one ball, and once with 90 grains powder and two balls. The piece to be closely examined after each discharge. [Note—Pieces built to fire .45-70-405 ammunition.] Any gun failing in any of the foregoing tests will not be submitted to further tests.

Supplementary Tests.—1. To be fired with two defective cartridges, Nos. 1 and 2, and then to be dusted five minutes, the mechanism being in the mouth of the blowpipe and closed, the hammer being at half cock; then to be fired six shots, the last two defective Nos. 1 and 2; then without cleaning to be dusted with the breech open and fired four shots. The piece to be freed from dust only by pounding or wiping with the bare hand. 2. To be fired five rounds with the service cartridge (.45-70-405; then without cleaning to be fired five rounds with 120 grains powder and a ball weighing 1,200 grains; the gun to stand twenty-four hours after firing without cleaning and then to be thoroughly examined. 3 Facility of manipulation by members of the board. 4. Liability to accidental explosion of cartridges in the magazine.

Additional tests may be made to clear up doubts raised by previous trials.

* * * * * * *

Under the fourth supplementary test, in addition to the test already made of giving a jolting motion to a column of cartridges in a vertical tube with the spiral magazine spring, a column of six cartridges to be jolted in a tube without the spring, and, if there be no explosion, then the lowest bullet in the column to be replaced by a pointed steel plug—first using the spring below the plug—and in the event of it not producing explosion to be tried without the spring. Also if there is no explosion resulting from the jolting tests, the tube containing the column of cartridges heavily weighted at the lower end to insure its vertical position, and having the spring at the bottom of the tube, to be dropped from a height of twenty feet upon a pavement, and if there is no explosion to be dropped as before without the spring in the tube. Afterward a pointed steel plug to replace the lowest bullet in the column, and to be dropped with the spring in the tube; then, if there is no explosion, the dropping to be finally tried with the spring removed. These tests to be applied equally to the Frankford and exterior primed cartridges.

[Now the only wonder is that any gun should have stood these tests at all, for any one must concede that they are excessive.] Forty guns, representing thirteen models, were submitted for experiment with results as follows, omitting all of no importance to this discussion:

In safety test and rapidity, with accuracy and rapidity-at-will tests, all magazines were filled, and in safety test but one gun failed by bursting of receiver. No cartridge burst in magazines, and there were 24 failures to extract. But here were 40 guns, each fired 10 rounds in safety test, or 400 rounds, and 3,713 rounds fired in rapidity tests, making a total of 4,113 rounds, and only 24 failures to extract, and these were nearly all by guns afterward found to be poor in design or defective, and were rejected. As an average the percentage of failure to eject was but .0058 per cent.

In the endurance tests, the results were as follows: 92 miss-fires; but 72 of the 6 were by guns of one model, leaving 20 miss-fires to the balance; 18 failures to extract and cartridge exploded in magazine. And yet here were 11,948 rounds fired as a whole, among which to divide the above accidents.

Defective cartridges—Miss-fires none, 2 failures to extract, 72 shots all told.

Dust test—9 failures to extract, 7 miss fires, 920 rounds all told.

Rust test—Miss-fires 27, but 18 by one gun; no failures to extract. 420 shots all told.

Excess in charges—Miss-fires none, guns generally opened hard, six shells with head blown off, 3 failures to extract, 63 shots all told.

Excessive charges—No explosion in magazine, 6 guns tested.

In all the tests for liability to accidental explosion in the magazine, but one cartridge exploded, there being 2,750 rounds fired from 6 guns in this test.

The tests mentioned above were never carried out; but the following modifications were adopted and tried with six guns that had been found by the preliminary trials to be best adapted for military purposes: "Liability to accidental explosions of cartridges in magazine A—Magazine to be filled with each of the four kinds of cartridges on hand and shut off. Then to be fired 100 rounds as a singleloader, in the fixed rest, using the heavy Frankford cartridge (70-500 grains) in the chamber to obtain greatest recoil where practicable. The cartridges in the magazine to be examined and changed after each fifty shots. B—Same as A, except the magazine being half filled. C—Same as A, except the gun suspended by wires so as to permit greatest extent of recoil." Four kinds of ammunition were used, viz: Frankford, U. M. C., Winchester and Lowell, and the following results obtained:

First Gun.—Test A omitted. Test B—One hundred shots; magazine partly filled; no explosion in magazine. Test C—One hundred shots; magazine entirely filled; no explosion in magazine; one failure to extract shell. This was repeated with the U. M. C. and Winchester ammunition, and with the Lowell ammunition up to 52 shots in test C, when a cartridge exploded in the magazine; 752 shots all told; tube magazine under barrel.

Second Gun.—Test A—Seventeen shots fired, when gun broke down from defects, not of the magazine, and became disabled, and tests discontinued; tube magazine under barrel.

Third Gun.—Test A—All four kinds of ammunition used for 100 shots each; no explosion in magazine. Test B omitted. Test C—Same remarks as for test A (800 shots all told; tube magazine in stock).

Fourth Gun—Test A—All four kinds of ammunition; 100 shots. Test B—Three kinds used, 100 shots used, when it became apparent there was no danger of explosion, and test discontinued. Test C—Three kinds and 100 each; all successful (1,000 shots all told; tube magazine in stock).

Fifth Gun—Detachable magazine; test only a short one; 150 shots all told, as it became evident the danger was a minimum.

Sixth Gun—Detachable magazine; test only a short one—40 shots—as gun was not easily loaded as singleloader when magazine was attached, and best results of gun not to be had when used a singleloader with magazine fitted and attached; 40 shots all told.

This is all I can give from the report without occupying too much space, but from it we can see how very unlikely such accidents as "G." mentions are to happen. One of the guns that stood the test the best is the very Hotchkiss model he mentions as one of the guns whose magazine exploded.

Those who might be timid about buying a magazine rifle after reading "G.'s" article can take comfort from the above, and rest assured that so long as they use proper ammunition there is not one chance in ten thousand of their getting hurt by any magazine explosion. By proper ammunition I mean that with flat, pointed bullets; and if the cartridges are reloaded at home, see that the primer is properly seated, and the danger is reduced to a minimum—it may be said to nothing.

Upon this very point of ammunition allow me to differ from "G.," and his friend who writes to him and whose letter he gives. It is a man's duty to examine every cartridge he intends to use. There are times when there is nothing else to do, and one can very pleasantly and very profitably spend his time in inspecting his ammunition. If he reloads it himself, then his reloading, if properly done, is an inspection. Primers should always be seated down where they belong, below the plane of the rear face of the shell. Proper priming tools always put them there if the shells and primers are intended for each other, and if one finds his primers won't go "home," then either shells are defective or he is using the wrong primers for his shells, and must change to get proper results. Primers not properly seated are dangerous in any gun, either singleloader or repeater, and besides are liable to cause misfires from not being seated firmly home to take the force of the blow of the hammer. Do not use too thin or sensitive primers for repeaters; there is all

the difference in the world in this, and the mainspring should be heavy enough to explode even the least sensitive.

Then proper reloading tools are a perfect gauge as to the length of the completed cartridge. To be sure, a cartridge for a repeater needs an invariable length, the same as for any other gun; for I know of no gun that will take cartridges that do not fit it and do good work. A cartridge a little too long in a singleloader may cause as much trouble and lose a man his life from the inability to "work" the gun, as one too short or too long in a repeater; and this variation in length will not obtain if the shells are loaded properly, as the ball-seater in a proper set of tools seats the ball invariably the same. Nor will properly loaded shells shorten up under the jolting in the magazine, for the ball should be firmly seated on the powder by heavy pressure or blows by a mallet, and cannot enter any further. The lubricating disk is a thing of the past long since, and should never be used in any magazine rifle or any other to secure accurate shooting.

But what is the use of my stating this? It is all known already by the rifle shot who merits the name, and I am sick and tired of hearing the man's fault laid to the gun; or trying to teach such a man what any rifleman should know, and that is how to not only take care of himself, but also load and take care of his rifle and ammunition, so that they will take care of him in the time of need. Any man who will take the field without such knowledge deserves all the ills that befall him, and needs a guardian to keep rifles and all such out of his hands until he is competent to understand and handle them. Doubtless there are many who need such guardianship, who always succeed admirably in getting themselves into a scrape and leave their friends to get them out; but don't let us hear their faults laid on the poor gun, when the latter would have served them well with even a very small amount of intelligent attention to its wants.

It so happens that I know Jim Baker very well, having passed the winter in the same camp with him once on a time and having had him on my pay-rolls as a Government scout, and he told me exactly how the accident happened to him. It did not happen from any accident with a Winchester, as "G.'s" article would lead one to suppose from the way he quotes his friend's letter; but it did happen from the explosion of the magazine of an old Spencer rim-fire carbine, and his accident was not the only one that has happened with such guns. The accident broke poor Jim's jaw, cut open his neck and tore off his right thumb, an accident that only could have happened with a gun with magazine in stock.

Now the time was when the Spencer was considered a fine gun, and in the hands of troops during the war it caused the enemy many a heart beat, and this, too, in spite of the defects of mechanism and faulty ammunition. It is a rim-fire gun, and so were the Henry and first Winchester, hence so many accidents, and never should have been used as a magazine gun, owing to its danger; but gunmakers have "to live and learn," and its day has long since passed never to return. So we can safely dismiss Jim Baker and his accident with the Spencer as entirely foreign to any accidents likely to happen with more modern weapons.

"G.'s" friend asks whether efforts have been made since the war to arm troops with repeaters. I can tell him, most emphatically, yes. Every civilized nation, and some that are not so classed, are experimenting with repeaters, looking to their general introduction as weapons of war. England looks upon the magazine gun as the coming weapon. Our own country has adopted them for trial, and they are now in the hands of some of our troops. Our Indian police are armed with them and know how to use them, too, while the Turkish cavalry were largely armed with them in their late war with Russia. Our arms companies are mainly interested in the production of repeaters for army use, and fill large orders for foreign shipment. The Winchester—then called the "Henry"—was in the hands of our troops during the late war, and many a time did the rebels meet a surprise party when coming against them, and the Indians, when first they met them, were most gloriously "licked" before they "tumbled to the racket," and to-day you cannot make an Indian arm himself with a singleloader when he can beg, borrow, or steal enough to get the wherewithal to buy a repeater, and when gotten he treasures it as the "apple of his eye."

After the "Milk River fight" in 1879, after the arrival of the relieving columns, I picked up handfuls of Winchester shells from behind the Indian breastworks, showing that the Utes had them to use—and did use them pretty effectually—against us. But the Spencer and the old Henry, or the early Winchester, compare about as favorably with our late repeaters as do the "flint locks" with the modern "hammerless," and the good work the more modern repeaters can do will compare as favorably with the work the old ones did.

But we are not striving for a weapon for troops—let governments do that—we are striving for a weapon for the hunter to which he can "tie" at all times and in all places, and the number of repeaters thus far developed that "fill the bill" can be counted on the thumb of a one-armed man. We have many so-called "sporting" repeaters, but they each and all would prove the "murderous" and "cruel" gun, which we hear decried against game, not because they don't shoot hard enough, not because they don't shoot far enough, not because they don't shoot lead enough, not because they don't shoot true enough when the distance is known; but because they all do shoot with a too high trajectory, throw too much lead and too little powder, and one cannot plant his lead with certainty in a vital spot. But we have one class of repeaters that is bound to succeed in spite of croakings as to the danger, quoted from experience with old pattern or inferior kinds of arms.

I will conclude this article by telling what I know has been done with a repeater, where verily a man carried his life in his hand, protected only by his coolness and skill, and the rifle he carried. In Arizona I know an Indian scout, with whom I scouted many a mile of country, who, one day in an engagement, ran an Indian into a thicket in a fight. Mr. Redskin was armed and was skulking for cover to get his chance at picking off a white man. The scout knew better than to rush in or to expose himself unnecessarily to fire, so he too crept around under cover until he could see about where the Indian was hid; then, believing that the Indian did not know about repeaters (the Apaches in 1870 to 1875 knew very little about them) he deliberately fired a shot, believing that the Indian would show himself to get his shot before the scout could reload. Show himself he did, with a grin on his face, as much as to say "it's my turn now," to get a shot between "wind and water" from the scout's repeater, that had been loaded without having been taken from the shoulder. Well, there was one "good Indian" more, and he never lived to learn how that gun was reloaded so quickly. Again, another scout, armed with a repeater, held alone the only place the Indians could escape from an engagement. He rained lead so fast upon them, and they were there by the dozen, that they could not and did not face it, but turned back to try the steep rocks, where the way was steeper, but where lead did not buzz like angry hornets.

I might multiply instances and not romance in the least; but each and all know of many a time when, but for the repeater, death would have claimed the hunter, scout or soldier, and it is needless for me to dwell on this.

Believing that the new departure in rifles is in the right direction, I can only hope it will prosper, leaving, however, each to take his choice, but at the same time earnestly hoping that blame for non-success will be put by each where it generally will be found to belong—upon the man and not the gun, provided a good, late pattern and thoroughly well-made gun has been chosen, and good, properly loaded ammunition is used therein. C. D.

P. S.—The work you are now engaged in of giving a complete description of the later styles and models of rifles is to be commended, for from the information there contained, riflemen can more intelligently select the rifle best suited to their wants. Those who have the opportunity doubtless post themselves upon all models of rifles before purchasing any, but there are so many that have not the chance, your description will give wide circulation of details, ordinarily not to be found in any advertisement, giving a fair field and favor to all. C. D.

DORCHESTER BAY DUCKING.

I WAS in Dorchester, New Brunswick, and complying with an invitation from my friend, J. H. H., I joined him on Easter Monday for a cruise down the bay in his gunning boat. Dorchester Bay is at the head of the Bay of Fundy, and the tide rises and falls thirty feet. We started at 4 A. M., and launching our boat on the ebb tide sped down the bay indifferent to the huge waves that tossed our boat around like an eggshell.

The boat, built for the purpose, is about fourteen feet long, flat bottomed, and propelled by paddle wheels and cranks, the covering of the paddle boxes being carried across in front, forming a breastwork which hid all but our heads from the birds. It was my first experience in this mode of gunning and I became enthusiastic over the ease and comfort with which we proceeded with my muscular friend at the cranks. My opinion was somewhat modified later when my turn came to play the part of steam engine in a launch. If any of your readers wish to try how it feels, let them place two grindstones side by side and then sit flat on the ground between them and turn them simultaneously for a few hours. Even that would hardly give a correct idea, as you must hold your head still so as to make your shooting hat look like part of the boat while paddling up to the wary geese and ducks. My spine even yet takes an occasional kink which serves to keep the experience fresh in my mind.

It would take too long to give a detailed account of the day; suffice it to say that we bagged five wild geese and three ducks, and becoming heedless in the chase let the tide get too far away with us, and when we tried to return home against the current the futility of struggling with the Bay of Fundy bore became apparent. By herculean efforts we succeeded in beaching our boat on mud flats about a mile from shore. After a somewhat extended wait, we reached home on the flood tide at 3 o'clock the next morning covered with mud and glory, the contents of the game bag being only one of the many incidents which made the day's outing most enjoyable. D.

AMHERST, N. S., April 24.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

Having suggested some objections to the full choke system in former communications, some advocates of that system have replied pretty vigorously; striving to fortify their position with some statements that must certainly cause a broad smile to suffuse the features of every practical sportsman.

The man who can increase his pattern 100 pellets simply by using a star wad over his charge of shot, must be certainly romancing, or writing up a big boom for the star wad manufacturer.

I will give you the result of some investigations and tests my friends and self have made: A standard 10-gauge shell, using Tatham's standard shot No. 8, 400 pellets to an ounce, will chamber on the outer circle circumscribing the inner circumference of the shell 25 pellets. Filling up the center, in even and full layer of shot, we have, by actual count, about 62 pellets.

In 1¼ ounces we have a total of 500 pellets, which, distributed in even, consecutive layers, as above, of about 62 pellets to the layer, make 8 layers, forming the full charge of shot. For other sizes of shot, and for guns of different gauges, sportsmen can make their own estimates.

It is a well settled principle that, of the pellets of shot of which the charge is formed, those lying on the outer circle of the cylindrical body forming the charge, and next the inner surface of the barrel, are, by the force of the discharge in passing out of the barrel, retarded to some extent by friction and more or less jammed into an angulated form thereby, thus destroying to some extent their efficiency at the limit of the range of the gun. Hence, it has long since been demonstrated that even in cylinder barrels, the pellets of the inner circle of the charge are most efficient, have the greatest force and penetration and the most killing power.

To do away with this difficulty in some measure, wire cartridges, concentrators and other forms of shot cartridge were adopted to preserve the spherical form of all the pellets composing the charge, and to keep all alike up to the same initial velocity. That they do perform what is claimed is too well settled to admit of either comment or argument. But, it is claimed for a loose charge in a full choke gun, that the choke effects the same purpose and more too. How! Is the friction decreased? It is increased; for upon the arrival of the charge of shot at the choke, the cylindrical form of the body of that charge must necessarily be elongated in order to pass out; and then too, the wad between the powder and shot assumes necessarily at that point a surface convex to the bottom of the charge of shot, thus increasing the number of pellets that are affected by the friction up the barrel jammed into angles and their spherical form more or less injured—the worst possible conditions for a good performance.

As shown above, the number of pellets in 1¼ ounces of No. 8 shot that lie next the inner surface of the barrel is 8 times 25, or 200, a large percentage of which would be affected in the manner described above even in a cylinder-bored barrel; in a full choke a much larger percentage would be affected.

It has been admitted time and time again in the communications of numerous correspondents who have contributed to these columns upon this subject, that buckshot and the larger sizes of shot will neither give good pattern nor penetration out of a full choke. Exactly so.

Some inquire: How shall I load with buckshot for deer? You had better not load with them at all in a full choke barrel. The result will be a failure in efficacy, and if you attempt to use any of the forms of shot cartridge the result will be the same. They will inevitably jam in the choke, the force be greatly retarded, besides being so scattered as to destroy their effect on your game. Then, too, repeated jammings of this character, if your gun be a light one at the muzzle or choke, will spring the choke out of it.

Use a cylinder-bored barrel for buckshot if you desire to make long shots; use a wire cartridge (Ely's are very good), and back them with every grain of powder your gun will bear. If the gun be an average good performer, you will have no reason to complain of results. BACKWOODS.

BEVERLY, W. Va.

DOWN AN IDAHO SNOW SLIDE.

Editor Forest and Stream:

I send a few notes from letters received from Idaho, thinking they might prove interesting to some one, or serve if more entertaining matter was lacking.

"Rocky Bar, Idaho Territory.—Dear F.—The package of FOREST AND STREAMS received. We take great pleasure in reading them here in the wilds, for I can appreciate a hunting or fishing trip myself, though game is so plenty here, the majority don't care for hunting except for meat to eat. I think I should like to have one of the smart dogs I read of in the Kennel department, though we can find grouse easily without a dog. The favorite dog here is a good deerhound that can be held in check, unless game is wounded and then sent after the deer. The game law is very strict in Idaho now, and it has been enforced several times in this county. Nevertheless, I must plead guilty to taking what game I need for my personal use in or out of season, as I contend I have spent time enough making trails over the mountains to entitle me to all the game I can eat. We had a nice spell of weather a short time since, and the grouse began to come down, but yesterday it stormed again and they will stop. One of the mail carriers traveling on snow shoes ran across three deer on Boise River bottom and 'took in' two with his snow shoe pole; they had been living in the bottom and were fine and fat. When one has been living on frozen beef all winter a change is beneficial. Snow here about 5½ feet deep and coming down fast, but what comes from this out don't pile up. The other day I had quite an adventure, and as it is one that, though it might happen to many, few would like to relate, will send you a scrap cut from a local paper. Judge for yourself." The scrap reads as follows, being taken from the Wood River *News-Miner:*

"It is seldom in the career of a reporter that he is enabled to chronicle a more thrilling adventure or fortunate escape, than that which befel the well known foreman in charge of the Bonaparte Company's mines. Having occasion on Wednesday evening last, to visit the prospecting camp of Gray and Marly, some two miles distant from the Bonaparte, Mr. McK. mounted his snow shoes and began the ascent of the bleak ridge dividing the two places. Albeit the snow was as nearly slush as would conveniently lie on the mountain side, he determined on reaching the summit to have a ride down the mountain, and accordingly turned his shoes down a steep and precipitous ridge leading into Snake Creek Canyon and while descending with the speed of an arrow, he suddenly felt his footing give way and instantly discovered that the entire mountain had slid and that he was in the midst of an enormous snow slide. With great presence of mind he hastily disengaged himself from the incumbrance of his snow shoes, and by dint of much kicking, struggling and rolling, managed to keep on top of the slide, which was twisting and splintering gigantic trees in its fearful rush to the canyon below, which was filled many feet deep with the frozen element, which had by this time reached nearly the solidity of ice, and swept away everything movable in the shape of trees and rocks from the mountain side above. Yet when the tremendous mass of snow was still, Mr. McK. found himself still on top, and with the exception of a few slight bruises and a sense of suffocation, unhurt, and a few minutes later was exultingly relating his fearful snow slide in a place of safety."

To one whom the fearful power of a snow slide or avalanche is known, the above adventure and escape from death is truly miraculous. PRAIRIE DOG.

DETROIT, Mich.

QUAIL FOR THE MILLION.—Henrietta, Clay County, Tex., May 1.—It was a beautiful day. I boarded the cars at Henrietta for Bowie, to see what prospects there were for next September. Twenty-eight miles brought me to Bowie, on the Fort Worth and Denver City R. R., just into the cross timbers of Montague county. I there found as good a team as is generally found at a livery; called on a lady friend to take a drive. We started out. The first I saw of quail was a boy throwing rocks at a covey as they ran along the roadside, a mile's drive. I saw what appeared to me a continuous covey. Quail to the right, quail to the left, quail to the front, quail all around. I was astonished. I suspect my lady friend thought me a dull fellow, I was occupied thinking what a time I would have with old dog Blackmore on the first of September. I would have kept this to myself, but quail were too numerous. I went off the road and found quail behind every bush. I now heartily extend an invitation to all dog-breakers, field trial men, pot-hunters and market hunters. All come. The country is alive with Bob Whites; quail in Montague county by the millions. Open post oak shooting. What is better? Brother sportsmen, where quail are scarce, come and kill a few before something happens, but do not come till September.—ALMO.

AMERICAN AND IMPORTED GUNS.—*Editor Forest and Stream:* "Vitus" says "that a better gun can be made in America for the same price that you would pay for an English gun in the same place." But when you consider that English guns pay from thirty-five to forty per cent duty, besides a liberal profit to the importer, you will see that there is no comparison between them, and to get their comparative value, you must find what your English gun cost before importation, and then compare it with some American gun of like cost, and I think you will find the English gun is the best.—HOLLIS.

IN A COLD WATER HOLE.—North Loup, Neb., April 14.—Having had much enjoyment in reading the experiences of your contributors, I will add my mite. This is a fine place for hunting, but our one grief is the want of guns that will do sufficient execution among the geese. I read of guns that will kill geese from 80 to 110 yards with BB shot. I shot at one about thirty yards with BB shot and hit him with seven, four going clear through him. He got clear across the river and up on the bank before I got to him. Last evening I killed a white pelican that measured eight feet two inches from tip to tip and five feet six inches from point of bill to claws. I had a 12-gauge 16-pound muzzle-loader with 43-inch barrels. No geese came nearer than seventy-five yards, and I could cut out lots of feathers but kill no goose. At last a small bunch passed nearer. I picked out my bird, and when the report jarred the surrounding bluffs he fell. He lay on his back kicking for quite a while, then slowly recovered himself and started across the sandbar. I stripped and took after him. I retained my upper garment and pulled it over my head for fear the goose might be embarrassed. I stepped into a quicksand hole just six feet deep. Luckily there were three inches more to spare or I might have got wet. Just here will somebody please tell me how the water in those holes manages to maintain a temperature of 25° below zero all the year around? At least that's how it felt. Well, I just got close to him when he flew off down the river. My wife don't allow me to swear, but I quoted some forcible passages to him. Then I had to wade back, and fell in another hole. The climate of Nebraska must be mild, because the railroad documents say it is, but dressing on the bank of the river in a cold east wind don't count. Is there any gun that will shoot close enough to hit a goose with at least four OO shot at eighty yards, and hard enough to drive them through? If there is I will have it next fall.—C.

LOUISANA NOTES.—St. Martinsville, La., April 14.—The past season in this vicinity was a gamy one. One hunt I wot of by two members of the Louisiana Gun Club in company with a local shooter; sum total of bags in three days, 487 quail. One member of same club, on annual hunt, bagged 97 woodcock. I am informed he wasn't the best shot in the club either, consequently many birds got away. On the lake ducking was splendid. I shot exclusively over decoys, and made bags from 11 to 35 on each hunt. Of course, at present all game has departed hence. The fishing on the lake has been good. I've known parties already to have captured 24 fine trout through the holes in the floating prairie contiguous to Spanish Lake. The largest of trout which I refer to was five pounds, the smallest two pounds. Last summer I heard of eight and even eleven pounders being captured. Of course, you are aware these are not the "speckled beauties" that I read so much of in your columns, but the lake, or green, trout, as they are termed here. They are exceedingly delicious in flavor, as the water of the lake is clear and cold even in our hottest August days, it being fed exclusively by subterranean springs.—J. P. H.

FLORIDA GAME.—Enterprise, Fla., May 8.—The hunting for the season is over at this place, the Brock House having closed two weeks ago. Notwithstanding the many sportsmen who hunt here during the winter, and kill quantities of game, deer can be found three miles from here in large enough numbers to make a day's sport both exciting and profitable. A resident of this place bagged three while out one day last week. Quail are plenty, but do not receive the sportsman's attention as they do North. They are very tame and are caught in traps, few being shot by the residents of this vicinity. The sport most indulged in by the winter visitor is fishing, because a novice can be successful, while hunting deer requires the surest shot. Trolling is the favorite mode of fishing, and an experienced angler seldom returns from a day's fish with less than twenty, and as high as eighty-three have been caught by one man in a day. Bass are caught more than any other variety. For duck shooting come here in November, when hundreds make Lake Monroe and adjoining ponds their home for the winter.—G. G. J.

NEW YORK GAME LAW AMENDMENTS.—The amendments to the game law passed at the last session provide that non-residents of Richmond county, (Staten Island) must take out a $10 license before shooting there. This we believe to be an unconstitutional law. Woodcock open season in Oneida and Delaware counties, Sept. 1-Jan. 1; elsewhere, as before, Aug. 1-Jan. 1. Squirrels, open season, Aug. 1-Feb. 1. A third amendment, relating to power of supervisors, will be given in our next issue.

AN OLD TIMER.—Meigsville, Ohio.—I am an old man almost seventy, yet I like to shoot a good rifle. I was one of the first settlers of Morgan county. In 1815 there were deer, black bear and wolves in abundance. I used to shoot deer with a flintlock rifle.—I. R. W.

IOWA WILDFOWL.—Hastings, Ia., April 8.—I bagged over forty geese on the "Platte," near Kearny, Neb., in two days, over decoys, last week. There are millions there, but you have to hit them hard to score.—M.

WHAT THEY SAY OF "WOODCRAFT."

The little book on "Woodcraft," by "Nessmuk," is admirable in its way, going over the whole ground of outfit, food, fire, etc., with sound, practical knowledge and not a little originality. The most experienced camper-out will find something new in it, and the tyro will find it a storehouse of practical knowledge. Take, for instance, his recipe for making club bread, that we fancy no club has ever indorsed. The first ingredient is a heavy club of black birch or sassafras two feet long and three inches thick at the big end, shaved clean, and stuck in the ground, small end down, the big end over a bed of live coals, where it will get "screeching hot." Meantime the dough is mixed and kneaded, and then wound in a long strip, spirally, about the broad end, and baked for half an hour before the fire, with frequent turning. Sometimes his woodland instinct against superfluous duffle gives way with dry humor to his appetite. "I often have a call to pilot some muscular young friend into the deep forest, and he usually carries a large pack-basket, with a full supply of quart cans of salmon, tomatoes, peaches, etc. As in duty bound I admonish him kindly but firmly on the folly of loading his young shoulders with such effeminate luxuries; often I fear hurting his young feelings by brusque advice. But at night, when the camp-fire burns brightly, and he begins to fish out his tins, the heart of the old woodsman relents, and I make amends by allowing him to divide the groceries." In canoes, he recommends the light clinker-built paddling canoe, though he confesses that his ten-and-a-half pounder was rather light, and advises one twice as heavy. He also recommends, besides the regular double-blade, a small auxiliary single-blade paddle, tied with a yard of line to a boat rib, ready for use in a narrow stream, and not lost when dropped for a hasty shot, or by accident. But we must refer our readers to the book itself.—*Outing and the Wheelman.*

"I AM WELL AND STRONG, and don't need to insure." Queer logic! When you are sick or broken down you can't get insured. Now is the time to insure—in the Travelers, of Hartford, Conn., best and cheapest of sound companies.—*Adv.*

Sea and River Fishing.

SALT-WATER FISHING.

AS a reader of your paper I take the liberty of asking you how it happens that your news on fishing is all about trout and other angling, such as only a rich man can afford. Now I know of many readers of your paper who, like myself, can only afford to do salt-water fishing in the vicinity of New York, and if you would give us some talk on this subject we would feel that we "poor, but honest" fishermen were not overlooked. Now, as for trout fishing, we would enjoy also, and if you could only get your South Oyster Bay correspondent (Geo. Killian) to post us as to where we could get free fishing on Long Island, we would be doubly favored. TACKLE.

[It occurs to us that the probable answer to "Tackle's" question is to be found in the fact that fresh-water anglers are more enthusiastic than the salt-water fishermen. If the latter are not sufficiently interested in their pursuits to write about them, they will, of course, be crowded out. If "Tackle" wishes to be posted by our South Oyster Bay correspondent, perhaps the simplest way would be to write to him and ask the questions on which information is desired.]

LAKE ONTARIO SALMON.

A VERY interesting letter has been written on the salmon of Canada, and especially of Lake Ontario, by W. G. Austin, of Maple Hurst, Megantic, Quebec, to the Toronto *Globe*. The letter is much too long for reproduction in our columns, but it contains a great many good points and truths which deserve wide publication, and these we extract:

Referring to the salmon, he says: "This noble fish at one time abounded in Lake Ontario and its tributaries, as well as in the St. Lawrence, the Ottawa, the Saguenay and their tributaries, but the wasteful practices and the murderous engines planted by the greed of man in every spot where this persecuted fish wanders, have nearly annihilated the race." * * * "The Government of the Provinces, as then constituted, appointed fishery officers to regulate these important fisheries. At the time a law existed on the statute book which was all that could be desired. All fixed engines and self-acting instruments were forbidden to be used in the capture of salmon, trout and maskinonge."

After referring in commendatory terms to the action taken on this subject by the English authorities, Mr. Austin continues:

"The department found a good law on the statute book, and, wishing to change it, a committee of members of the Quebec Parliament was named to investigate the qualities of the fixed engines. They examined principally the fishermen who used mesh nets anchored to the soil, and took the evidence of these interested parties as material upon which to base their report to the House."

The report of the committee was substantially to the effect that the engines used in Canada were not so injurious to the salmon fisheries as certain amateurs had supposed, but at the same time time it recommended that their employment should be limited as much as possible. It was shown to the Government on the most undoubted evidence that wherever the fixed engines had been used salmon fisheries had rapidly declined in value. The opinions of experts was asked and they denounced the action of the department as calculated to destroy the salmon fisheries entirely.

Again Mr. Austin says: "Now we come to the brush weirs, engines self-acting, made of a kind of wicker work extending from the high water mark down to the low water mark, sometimes nearly a mile in length; covered with water when the tide is full and bare when the tide is out, with one or more pounds or receptacles into which fish of all kinds are forced by being unable to get through the tender of the weir. There are hundreds of these weirs erected on the shores of both sides of the St. Lawrence. I read in a sporting work many years ago that these weirs had destroyed the salmon fisheries of Lake Ontario, no salmon from Lake Ontario or above the tidal flow could get down to the ocean through these weirs. All these statements and arguments were contained in the representation sent to the Hon. Mr. Campbell, and that gentleman knowing that it was impossible for the fish migrating the shores to pass them, made a provision that in the lowest part of these weirs a grating should be placed to admit the passage of the fry of fish. I have visited many of these weirs, and have observed that as soon as the current begins to ebb it carries with it sea weed and other floating matter, and lodges it against the gratings and closes them completely. It happens, too, at every ebb of the tide, that the first fish swimming to this grating attempting to go through, their bodies fill up the spaces and leave no passage, so that this device of the grating is useless. I have seen fish from a full grown salmon to a little sardine caught at the same time, and I have been told by a credible navigator that he has seen eighteen bushels of young salmon caught and lying dead in a single weir at one ebb of the tide."

Mr. Austin then proceeds to point out the folly of the action of the government in spending large sums annually in their efforts to restock Lake Ontario and the St. Lawrence with salmon while the shores of the river are blocked with these weirs and other appliances which render their passage from the ocean to their breeding grounds impossible. "On their way from the sea to their breeding grounds," says an excellent authority, "the salmon never swim in midstream, but hug the shores as if they were scenting out their own rivers."

In another portion of his letter Mr. Austin says:

"Two hundred and fifty-nine thousand four hundred dollars have been spent in building and working fish hatcheries in the Dominion, and a great part of them above the tidal flow. From the great Dominion fish-breeding establishment near Newcastle, Ontario, 5,600,000 young salmon have been distributed, and not one of them has ever been known to return. How could they ever reach the sea (and to the sea the genuine *Salmo salar* must go or perish)?

"Twenty years' valuable time has been lost, besides all this money. The Fisheries Department were warned by me over and over again that their system was worse than useless, and the result is even more deplorable than I could have anticipated."

And again—"Not one of these bush weirs that have destroyed the 5,600,000 young salmon, the fourteen years' product of the great fish-breeding establishment at Newcastle had a legal right to exist; and what were our Ministers of Marine and Fisheries doing when they allowed the public use of the coasts of the St. Lawrence to be so encumbered as to commit such havoc upon the ratepayers of the Dominion? They have eleven fish hatcheries now in operation, eight of them hatching salmon eggs, with the shores around them full of destructive fixtures and anchored self-acting engines, they are going on to protect the fisheries off the face of the earth."

In concluding his letter, Mr. Austin says:

"The course to be followed is plain, but we have to beg in again and be wiser. Lake Ontario connected with the tides of the Atlantic Ocean through the St. Lawrence, with its great tributaries, the Ottawa and the Saguenay, and all their branches, forms a field for the cultivation of salmon unrivalled in capacity and extent. The river Tay in Scotland is expected to yield annually 80,000 fish of the cash value of £60,000 sterling, or about $300,000 of our money, but there are no brush weirs and mesh nets there.

LANDLOCKED SALMON IN SEBAGO.

THE season for landlocked salmon fishing in the Sebago waters is practically at an end for the year. It is true that a large fish may be occasionally taken, even as late as the last of June; but still with the return of the smelts to deep water the salmon go also, and but little is known of their whereabouts, except in spawning time, for the rest of the year. This season has been the best since this resort for sportsmen began to attract attention. There have been no very large fish taken, but the numbers are much larger than ever before, and speak a good word for what little protection has been done, and that is little enough, at best. Eleven pounds would be about the true figures for the largest specimens taken in these waters this spring, but there have been several of these, and a large number ranging from five to ten pounds. Also a much larger number than usual of "red spots" have been taken at the same time.

The fish have been very democratic in their tastes, and have been attracted by the clumsy fishing of the novice fully as often as by the most skillful angler. A good illustration of this was the case of "Biddeford," who, after furnishing sport for all hands for three days by his awkwardness, went away on the morning of the fourth day with 11 large fish, all of his own catching. Of the Maine Fish Commissioners, however, who are the acknowledged leaders of this class of sport, one was obliged to content himself with a single "red spot" of four pounds for his week's work. The other Commissioner was a little more fortunate, as he bagged two salmon and three "red spots." Supt. Hamilton, who caught the big fish of last year, served his time this year without scoring a single fish until the morning that he went away. At that time his friends gave him a half dozen fish, so that he would not go home euchred. But fishing is uncertain. This same gentleman, trolling, as he was being rowed across the lake on his way out, captured two salmon of six and seven pounds respectively.

Considerable amusement was caused by an adventure of a party fishing from a canal boat. There were six or seven men on the boat, but no one of them had ever caught a salmon, unless it was with a pitchfork or sucker spear. As luck would have it, one of the number struck a fish which proved to be a 10½-pounder. The capturer at once reeled in his prize until he had the fish at the end of his rod, where it was making a terrific swashing of the water in its struggles to get away. At this moment one of the party reached an old smelt net under the fish just in time to receive it as the hook broke. The last man then attempted to lift the fish on board with the net, but just as it was over the side, the fish, with a flop, went through the bottom of the net and struck squarely across the rail of the boat. For a moment it seemed to balance in that position, and then, by a turn unlucky for itself, slid from the rail into the boat.

Another party of sportsmen have distinguished themselves in a way rather more questionable. They used bait from the tank of live smelts which the club had put in, without asking leave, but this was allowed as the gentlemanly owners thought that there was enough for all. When the same party went away they put in their crowning act. They dipped all the smelts from the tank they could, and fried them for their breakfast. Then, to add a greater insult, they broke open one of the fish cars belonging to the club and stole a large salmon. These fellows will probably have an invitation to call and settle.

Something over one hundred fish have been taken in all, the largest catch by any one individual being "Biddeford's" 11. Sunday, May 4, was the best day, there being both the largest number of fishermen (over thirty) and the largest number of fish taken. On that day there were five boats on the bar, each playing a salmon at the same time. The accommodations at the Sebago fishing grounds are as yet rather limited, there being but one camp and that private property. The most of the comers have to shift as they can. Boats are plenty, and with a man to row, cost from $2 to $2.50 per day.

It is sheer nonsense to talk that this fishing is well protected in close time. The poaching is still carried on under the very noses of the wardens, who from fear, or more questionable motives, have thus far displayed their great ability in talk only. The services of one resolute man like Detective Wormwell, for a week, are worth more to the salmon fishing interests here than a life time of such granny ism as that heretofore displayed by the wardens.—*Portland (Me.) Correspondence Boston Herald, May 17.*

PHILADELPHIA, May 17.—Trout fishing in the many streams in Pennsylvania has been very good this year. Favorable weather and good condition of the water aided, and we hear of good catches from many anglers returning. Bass fishing is yearly attracting more and more trout fishermen, and not a few zealous fly-fishermen have confessed they as fully enjoy the struggles and leaps of a fair-sized bass as they do the rise of a trout. Some of the older members of the West Jersey Game Protective Society who were instrumental in having the head waters of the New Jersey streams stocked with fish, state they have not noticed any good results from their work, and it has now been several years since the fry was liberated.—HOMO.

TROUTING IN THE BIG BUSHKILL.—In reply to "Homo" in your issue of May 15, would say that I have several times caught large trout in the still waters of the Big Bushkill with live bait—minnows. I only have resorted to this after thoroughly going through my fly-book, most always finding some "feather" that would lure them out of those deep pools. If all this persuasion was of no avail then I offered them fin instead of feather. Sometimes even this was not taking. While whipping one of our little streams last week I saw five wild turkeys and an unusual number of pheasants. I am afraid the winter went hard with the quail. I have several coveys which I have hired kept.—SPICEWOOD.

NET FISHING IN LAKE CHAMPLAIN.—The Montpelier *Argus* says: There is considerable agitation these days relative to net fishing in Lake Champlain, caused by efforts to enforce the law forbidding it. The spring and early summer is the season when the wall-eyed pike or perch-pike and the black bass spawn. The great spawning grounds of the whole lake for the wall-eyed pike is Missisquoi Bay, or more properly the streams emptying into it. The Missisquoi river being of much more importance in this respect than all the others. The wall-eyed pike, the most palatable and most important of all the food fishes in the lake, leave the deep waters they frequent at other seasons, and seek the shoals of the bay and its tributaries, to deposit their spawn, commencing to run in February. Then these net fishermen begin their warfare upon them, the especial harm being that they catch them in immense quantities just at the time that to do so is to exterminate them. They catch them in fyke nets which stretch across every avenue whereby the fish pass to and from their spawning beds; they take them in pound nets, the arms of which reach out and guide them into these prisons; and they drag the bed of the lake with seines that reach almost from shore to shore, making it almost a wonder that a single fish escapes, to deposit its spawn. Commenting on this, the *Republican*, Plattsburgh, N. Y., says: "Is it not possible to devise some way to prevent this wholesale depopulation of the lake? If there could be a stop, or even a temporary check, for a brief season, to this wasteful destruction of the embryo fish, the inhabitants of the Champlain valley could have a plentiful supply, in the proper season, of the delicious food, fresh from its rich pasturage, and the lovers of the sport could have abundant opportunity to exercise their skill and occupy their leisure, with a fair prospect, and even some assurance, that they would not wholly lose their time in vain effort. As it is, they are not only nearly altogether deprived of the grateful nourishment, and of the excitement attendant upon the pursuit of it, for if the over sanguine do affect the hook and line they are almost certain to return with disappointed hope and sun burnt energy to ruminate upon the inefficacy of the laws and the rapacity of mercenary and reckless pot-hunters." The Rutland *Herald* also has something to say on the subject, as follows: "Fish and game protective associations seem to be the same in New York that they are in Vermont; they do not protect. Some of the most prominent members of the Vermont Association live in Franklin county, where a majority of our fish pirates lives, and skin the spawning grounds of the wall-eyed pike every spring, but these 'fish and game' fancy sportsmen never take any pains to enforce the fish law. If it was not for the zeal of Hiram Atkins, of the Montpelier *Argus*, no fish pirate would ever be brought to justice. The Montpelier *Watchman* says that 'Fish Wardens F. H. Atherton, of Waterbury, and John L. Tuttle, of Montpelier, assisted by C. E. Demerritt, of Montpelier, William Deal, of Waterbury, and Constable Rockwell and Mr. Fadden, of Alburgh, last week Wednesday seized four nets belonging to the Mitchells, of Alburgh, who, a few weeks ago drove off officers who went after their nets. Two of the nets seized were new pound nets, costing $50 each this spring, and two were gill nets. The same officers were up there again on Thursday, but nobody was fishing.' These facts tell the story. The officers of the law in Franklin county suffer fish full of spawn to be swept off their beds every spring with impunity, and Mr. Atkins has to call upon the authorities of Washington and Chittenden counties to enforce a law that the authorities of Franklin county ought to have local pride and common sense enough to enforce. Fish and game protective associations angle sometimes, eat fish dinners sometimes, but they nevor protect fish."

THE IRONCLAD OATH.—Philadelphia, Miss., May 2.—*Editor Forest and Stream:* I send you a clipping from the Neshoba *Democrat*, which shows one way to initiate members into a fishing club. This club was organized for bream fishing, and the common black crickets are the only bait used in taking the fish. It will be seen that the treasurer's only business is to take charge of the crickets, there being no money in the club to look after.—S. P. NASH. "Proceedings of the Fishing Club at Lake Burnside, April 14, 1884, 8 o'clock P. M. All members present; also the Hon. J. H. Reagan, applicant for membership. Club proceeded to business, as follows: *Resolved*, That the president of the club propound such questions to applicants for membership as he thinks proper, or such questions as may be suggested by any member of the club, with a view of ascertaining their competency to become members, or their usefulness if elected to membership, taking into considerstion their business or avocation in life. After the adoption of this resolution the Hon. J. H. Reagan, being in waiting, was introduced and prepared for admission, first by divesting him of all cumbersome wearing apparel and tieing his hands behind him substantially with a fish string. After these preparations he was placed in the end of a small canoe and a No. 2 snood hook inserted up to the beard in his upper lip, to which a line fourteen feet long was tied and attached to a pole of equal length, and the pole given to a member, who stood on the bank of the lake, in which condition the following questions were propounded to him by the president of the club: First—Are you a prohibitionist? Ans.—I am not, but object to excessive drinking. Second—Do you own a breechloading shotgun? Ans.—I do not, but expect to purchase one as soon as my pecuniary ability will permit. Third—Do you own a horse sufficiently strong to carry four skillets, eight bed quilts, one-half bushel of shelled corn, six poles, yourself, and rations sufficient to last four men three days? Ans.—I have such an animal, but his back is very sore at present, but is rapidly recovering. Fourth—If you were called upon by a member of the club and informed that the wind was from the south and that the age of the moon indicated that the sign was in the fishes mouth, would you start immediately though your father was indicted for murder, and the penalty death, if found guilty, and your service as a lawyer needed to defend him and the day set for his trial included a day that you expected to be absent fishing? Ans.—I would obey the summons unhesitatingly. Whereupon a motion was made by Bro. J. B. Parkes that he be received into full membership, which motion prevailed and the member was gently shoved backward into the river and directed to invest himself of the clothing of which he had been divested, and returned to the club, where the new member was lectured as follows: 'Bro. Reagan, you were placed on the end of the boat and the hook fastened in your upper lip, not for the purpose of inflicting physical pain, but to teach you to be perfectly quiet in case your comrade in the same boat were to make an awkward throw and hang the hook in your eye, rather than squirm and twist about and thereby disturb the waters and frighten the fish. You were asked the other questions in reference to gun and horse to ascertain whether you were sufficiently equipped to make an efficient member. You were asked the last question to see whether you were connecting yourself with the club with that degree of faith and integrity that is necessary to build up and support any institution.' The club having no treasurer Bro. Reagan was put in nomination and unanimously elected, and the crickets turned over to him for distribution among the members. A petition for membership was received from R. E. Holmes, Esq., and a committee appointed to inquire whether or not the said Holmes would be likely to make a good member—which committee, after a few minutes' deliberation, reported that he was wholly unfit in every material particular, whereupon he was duly rejected. The club then proceeded to the lake, and after having captured, cooked and devoured forty very fine bream adjourned to meet on Thursday the 16th inst.—F. M. WOOD, President."

WHITE PERCH IN FRESH-WATER PONDS.—The experiment of planting white perch (*Roccus americanus*) in Lake George by Captain E. S. Harris and Messrs. W. W. Lockhart and O. B. Lockhart, mentioned in FOREST AND STREAM of a late date, cannot fail to meet with success if the fish deposited in these waters are large enough to take care of themselves and escape the attacks of the black bass. An instance where the white perch has been taken from tide water and placed in a pond, and increased to such numbers and great size as to furnish capital sport, came under the writer's observation many years ago. Black's Pond, located near the town of Swedesboro, N. J., empties its surplus water through flood gates at its breast into Church Run, and the run into Raccoon Crek, a tide-water stream running into the Delaware River. Twenty or more years back a seineful of white perch, taken from the creek, were placed in the pond mentioned, and the fish became very numerous and were frequently taken weighing three pounds, with live bait, just as one would fish for bass. Your correspondent has had fully as much enjoyment with these large perch as with the bass, with a light rod and fine tackle, and the residents of Swedesboro well remember the catches made by the writer in boyhood, only to be equalled in number and weight by old Lev. Anders, a native of the place. The perch in this pond lost the darker shade on the back that is found on tide-water fish. They also seemed to be less robust and of a finer outline than their relatives of the creek, and notably in color of a brighter silver. We took them in the deeper parts of the pond, from a boat, under the overhanging trees wherever the shade was darkest, in the same manner bass would be angled for with live bait. Since that time a freshet has carried the dam away, and I understand the perch have disappeared, no doubt into tide water. A new dam has been built and its waters stocked with black bass by a party of gentlemen, of which your correspondent was one, but I have not learned if the bass have thriven. There is no reason why the white perch should not be placed in many of our inland ponds. They are gamy and make excellent sport, growing to double the size they do in tide water, fresh or brackish.—HOMO.

BIG CATCH.—Monson, Me., May 16.—Yesterday three young men from our village returned from Riddell Pond, which is situated in the wilderness twelve miles west of Shirley and about eighteen miles from here, with 338 spotted trout, which weighed 102 pounds. They left here Monday, the 12th, fishing Tuesday and a part of Wednesday. They caught in all, including what they ate in the camp, over 400 fish. Riddell is one of a chain of lakes and ponds, the outlet of which empties into the Kennebec River. They are so far from civilization and uncivilized poachers that trout fishing there is now in its primitive state.—J. F. SPRAGUE.

OCEANIC, N. J., May 20.—The fishing has commenced in the North Shrewsbury River. I took the first bass (striped) this morning; took four fine ones trolling.—GEO. WILD.

Fisheulture.

THE AMERICAN FISHCULTURAL ASSOCIATION.

THE annual meeting of the Association was held in the lecture-room of the National Museum at Washington on May 13, and was called to order by President Benkard, who made an address of welcome to the members and reviewed the events of the past year. The Secretary read the minutes of the last meeting and the Treasurer gave in his reports, both of which were approved. A list of papers had been prepared, but it was found impossible to follow it in the regular course, because some of them had not arrived.

Prof. Spencer F. Baird was elected an honorary member, and the following new members were proposed and elected: Charles G. Atkins, Bucksport, Me.; Tarleton H. Bean, Washington, D. C.; Prof. A. S. Bickmore, New York; Dr. H. H. Carey, Atlanta, Ga.; A. Nelson Cheney, Glens Falls, N. Y.; Frank N. Clark, Northville, Mich.; J. W. Collins, Washington, D. C.; W. V. Cox, Washington, D. C.; Hon. Thomas Donaldson, Philadelphia, Pa.; R. E. Earll, Washington, D. C.; H. W. Elliott, Washington, D. C.; W. E. Garrett, New York; A. A. Hayes, Washington, D. C.; Dr. J. A. Henshall, Cynthiana, Ky.; George S. Hobbs, Washington, D. C.; E. S. Hutchinson, Washington, D. C.; A. J. Kellogg, Detroit, Mich.; Hon. E. G. Lapham, M. C., New York; W. L. May, Fremont, Neb.; Hon. H. P. McGown, New York; Dr. J. C. Parker, Grand Rapids, Mich.; Hon. R. G. Pike, Middletown, Conn.; Richard Rathbun, Washington, D. C.; Hon. Ossian Ray, M. C., New Hampshire; Prof. J. A. Ryder, Washington, D. C.; Carl W. Schuermann, Washington, D. C.; Col. James Stevenson, Washington, D. C.; Joseph Willcox, Media, Pa.; Lieut. Francis Winslow, U. S. N.; S. G. Worth, Raleigh, N. C.

At the close of the morning session the members inspected some fine specimens of European trout from the ponds of the New York Fish Commission at Cold Spring Harbor, and then went in a body to view the national carp ponds, which have been greatly extended during the past year. In the afternoon the papers and discussions were continued. In the evening the hall was filled with people to hear the addresses of the speakers who had been announced. Senator Lapham, of New York, chairman of the Sub-committee on Fish and Fisheries, presided and introduced the speakers. Hon. Theodore Lyman, of Massachusetts, made the opening address, and was followed by the Hon. S. S. Cox, of New York, who humorously illustrated any points which he thought the audience might think obscure.

The Wednesday morning session was mainly devoted to the oyster, Dr. Hudson, Prof. Goode and Lieut. James Winslow, U. S. N., reading papers on the subject of oyster culture, and Prof. Ryder taking part in the discussions. Col. McDonald followed with an equally important paper on the natural causes influencing the movements of fish, which was regarded by fishculturists as the most valuable paper read during the whole session.

The first paper of the afternoon was a thorough and carefully written article upon "The Chemical Composition and Nutritive Value of our American Food Fishes and Invertebrates," by Prof. W. O. Atwater. This paper was the outcome of some investigations undertaken at the suggestion of Prof. S. F. Baird, United States Fish Commissioner, and promoted by the contributions of certain of the members of the Association. Prof. Atwater said that a housewife of the middle or lower classes would, for economy's sake, choose the cheaper of two pieces of dress pattern in choosing clothes for her children, but was often forced to pay an exorbitant price for nutritious food because she was not aware that there were other kinds of food which were just as nutritious and very much cheaper. He hoped that this series of investigations might be the means of changing this condition of affairs to some considerable extent. On account of the length of the paper of Prof. Atwater, only one other paper was read, that on "Some of the Causes which Limit the Survival of Fish Embryos," by Prof. J. A. Ryder.

An election of officers was then in order, and the following were elected: President, Hon. Theodore Lyman, M. C., of Mass.; Vice-Presidents, Col. Marshall McDonald, of Va.; Treasurer, Eugene G. Blackford, of N. Y.; Corresponding Secretary, R. Edward Earll, of Ill.; Recording Secretary, Fred Mather, of N. Y. Executive Committee: James Benkard, N. Y.; Geo. Shephard Page, N. Y.; Barnet Phillips, N. Y.; G. Brown Goode, Conn.; Dr. W. M. Hudson, Conn.; C. G. Atkins, Me.; S. G. Worth, N. C.

Afterward the members visited the hatching station in the Armory building and saw the operation of the McDonald fishway and the hatching. On Wednesday evening a large number of guests, including Senators, Representatives, citizens of Washington, members of the Association and their wives and friends were present by special invitation of Prof. Baird, at a preliminary exhibition of the fisheries section of the United States National Museum. The exhibit was nearly the same as that made by the United States at the London Fisheries Exhibition last season.

On Thursday morning Messrs. Rathbun and Worth read interesting papers.

The meeting adjourned to visit as a body the President at the White House. The members were received very cordially by President Arthur, recalling very strongly the sympathy he has always felt and shown for fish as well as fishermen.

After returning from the White House the Fish Commissioners of the various States met at 12 M. at the National Museum in consultation with the United States Commissioner of Fish and Fisheries, Prof. S. F. Baird. Discussions followed in relation to the propagation of the shad, cod, whitefish, and especially the need of some aid, State or national, or both, in developing the oyster resources of the country. At 1 o'clock the members assembled at Lower Cedar Wharf, on board the United States Fish Commission steamer, the Fish Hawk, Lieut. Wood, United States Navy, commanding; and the vessel was soon under way for some of the fishing stations down the Potomac. On its return trip, and during the home journey, the Association held a special session in the cabin. It was for the purpose of receiving the report of the Oyster Committee, which had been appointed at the previous day's session. The committee reported resolutions recommending the adoption of the principle of individual ownership of oyster ground. And it was likewise the opinion of the committee that an investigation of all the conditions affecting the life of the oyster was eminently desirable and should be immediately undertaken. The resolutions were adopted, and it can hardly be doubted that the latter part of the first resolution, that advising an investigation, etc., is eminently desirable, and worthy of legislative action.

The following gentlemen were elected to be corresponding members of the Association:

Capt. N. Juel, Norwegian Royal Navy, President of the Society for the Development of Norwegian Fisheries, Bergen; S. Landmark, Inspector of Norwegian Fresh-water Fisheries, Bergen; Dr. S. A. Buch, Christiania, Norway, Government Inspector of Fisheries; Prof. O. G. Sars, Christiania, Norway, Government Inspector of Fisheries; Dr. Oscar Lundberg, Stockholm, Sweden, Inspector of Fisheries; Baron N. de Solsky, Director of the Imperial Agricultural Museum, St. Petersburg, Russsia; Prof. B. Beneke, Commissioner of Fisheries, Königsberg, Pomerania; Prof. T. H. Huxley, H. M. Inspector of Fisheries for Great Britain; Edward Birbeck, Esq., M. P., President National Fisheries Association of Great Britain; Sir James Gibson, Maitland, Bart., Stirling, Scotland; R. B. Marston, Esq., Editor of the *Fishing Gazette*, London; Dr. Francis Day, F. L. S., late Inspector General of Fisheries for India; Thomas Brady, Esq., Dublin Castle, Inspector of Fisheries for Ireland; Archibald Young, Esq., Edinburgh, H. M. Inspector of Salmon Fisheries for Scotland; Arthur Fedderson, Viborg, Denmark; Prof. A. A. W. Hubrecht, Member of the Dutch Fisheries Commission and Director of the Netherlands Zoological Station; M. Raveret Wattel, Secretary of the Société d'Acclimatation, Paris; Don Francisco Garcia Sola, Secretary of the Spanish Fisheries Society, Madrid; Prof. E. H. Giglioli, Florence, Italy; M. A. Apostolides, Athens, Greece; William Maclean, Sydney, President of the Fisheries Commission of New South Wales.

After a long discussion in which Messrs. Mather, Stone, Roosevelt, Endicott, and others strongly objected, the name of the American Fishcultural Association was changed to The American Fisheries Society, and the meeting adjourned.

The papers read, and the discussions, will be given in full in our columns.

MAINE SALMON HATCHING.

AS ILLUSTRATING the noble work being done by the Maine Commissioners of Fisheries and Game in stocking the waters of that State this year, it may be stated that they have already hatched 1,400,000 salmon fry. The little fish are in fine condition and will be turned loose to thrive for themselves by the time these words are comprehended by the reader. Messrs. Stillwell and Stanley have 700,000 sea salmon and 55,000 landlocked at Enfield for the Penobscot, 300,000 sea salmon at Norway for the upper Sebago waters, 200,000 sea salmon and 55,000 landlocked salmon at Weld for Webb's pond and adjacent waters, 40,000 sea salmon at Dennysville, 50,000 landlocked at Rangeley for the Androscoggin waters. The reason of the great quantity of sea salmon for the Penobscot is that Prof. Baird of the U. S. Fish Commission, has kindly donated a surplus of eggs in the hands of the Government Commission, to the Maine Commissioners, with the understanding that they go into Penobscot waters, their natural home.

It is suggested that Prof. Baird has not much faith in the putting of sea salmon fry into inland lakes, that they may become landlocked, while the Maine Commissioners are quite confident of its success. The Maine Commissioners are certain that sea salmon fry put into inland lakes, have grown up to large fish, but to what extent they are not certain, by reason of subsequent putting of the fry of landlocked salmon into the waters where proofs might have been abundant. But the most marked success of the restocking of inland lakes and ponds these Commissioners have seen is the case of Webb's Pond, in the town of Weld. In 1875 and 1876 a few thousand landlocked salmon eggs were put into this pond, where never before a salmon had been known. Within a year or two four and five pound salmon have been taken there and larger ones seen. Last year sportsmen fished there with great success, and probably the same thing will be done this year.

SPECIAL.

BOSTON, Mass., May 18.

THE MARYLAND COMMISSION.—The Governor of Maryland has appointed Dr. E. W. Humphreys, of Salisbury, to be a Commissioner of Fisheries for the Eastern Shore in place of Thomas Hughlett.

SHAD FOR THE HUDSON.—Last week, during the session of the American Fishcultural Association, Prof. Baird offered Mr. Blackford, of the New York Fish Commission, a million and a half of shad from eggs taken on the Potomac and hatched in Washington. The transportation car left Washington on the night of the 15th, and arrived at Glens Falls the next evening, where they were met by Mr. A. N. Cheney with teams, and part were planted above and the remainder below the falls.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1213.** Volume I., bound in cloth, sent postpaid, $1.50.

THE PHILADELPHIA DOG SHOW.

IT is now fully determined upon to hold a dog show in connection with the Pennsylvania State Fair in September next and preparations have already been made to erect a special building for the canine exhibition. The premium list will be a large one both in regular and special prizes. Collie trials will make an interesting part of the show and dog racing will give those unacquainted with this sport an opportunity to learn of its operation in this its headquarter city. The racing in New York at the late show was a farce and not a single dog but the little snap or wiffet had been trained to it or knew what it was expected to do. Owing to the fact that thirty or forty acres of ground will be inclosed at the State Fair, ample opportunity will be had for properly exercising the exhibited dogs, a feature that will please many and go far toward robbing the kennel owner of the fear of disease which is so often contracted at dog shows. Some proper changes in the classification of dogs and alterations in standards were made at the last meeting of the Philadelphia Kennel Club. This may cause comment, but we are sure the majority of dog owners will be pleased when the premium list now being printed reaches their hands. A second dog show to be held this year in Philadelphia is talked of for next May, and it had been fully decided upon before it was known one would be given in connection with the State Fair in September. HOMO.

A PRIVATE FIELD TRIAL.

DURING the last week of April we met on the snipe grounds to try conclusoins between Jack, owned by B., and Mac, owned by W., according to previous arrangements. Jack is a large sized orange belton setter of unknown pedigree, lithe and active in movement, with dark intelligent eyes, under the most perfect control in the field, with a natural instinct for hunting and a thorough love of his work—just such a dog as a sportsman delights to shoot over. Mac is a fair sized black, white and tan setter, quite handsome, also lithe and active, with beautiful motion in the field, obeying more because he must than from any desire to do so, but being owned by a thorough sportsman, was also under good control, although lacking the lively cheerful obedience of his rival. He is hardly bred up to the latest discovery in the science of setter breeding, the prescription showing him to have a few grains more Laverack than Llewellin in the composition or admixture, but he is a good dog notwithstanding.

According to the terms of the match the shooters were to walk abreast of each other at a distance of about sixty yards apart, the dogs hunting and ranging the same as in an ordinary day's shooting when using a brace of dogs together, with as little interference by the handlers as possible, so that the merits of the dogs must decide which is the best, not the sharpness of those handling them. The wind was blowing freshly from the northeast, raw and cold, making the birds very wild when the dogs were turned down shortly after noon, the shooters being headed down wind, B. being on the left, four friends (two of which acted as judges) following close in the rear, anticipating some fun, as some small bets had been wagered on the result by the friends of each. On being cast off the dogs went away beautifully, Jack going straight away down wind until a blast from his master's whistle wheeled him instantly, when he, tacking into the wind, quartered quickly, still carefully, back, and pinned the first bird before he was five minutes down. Mac did not back on sight, but was stopped on nearing the other dog, and was penalized for not backing. B. sprung the bird and dropped it handsomely as it rose into the wind. Both dogs were steady to shot and Jack, when ordered, retrieved it nicely. When the dogs were again cast off, Jack going down wind like an arrow, and just passing a third to leeward, wheeled so quick as almost to throw himself over and nailed it in a crouching position. This feat was much admired by all, and some remarking to B. he had a star of a dog, he quickly replied he was no star but the full moon of the dog kingdom, although not put up by prescription so far as he knew. Mac coming up was stopped but not penalized for not backing, owing to the unusual position of the pointing dog. The bird was sprung by B. and was dropped across a slough, both dogs being steady to the gun, and when sent on Jack found and retrieved it finely. When the dogs were again sent on, Mac doing some fine ranging, and quartering beautifully, but unfortunately blundering onto first one and then another bird without noticing them at all, and evidently lacking the caution and sense of his adversary. His owner contended he had been little used on snipe, and that it was an improper way to hunt a dog down wind. His opponent replied it was certainly the best way to get snipe, but that he was quite willing to try it any way. Then a return was made over the same ground up wind, a few birds flushing wild and turning back over the shooter, and dropping toward the lower end of the beat. On returning down after those, Jack suddenly turned to a staunch point by the side of a small ditch and Mac backed firmly. Two birds got up here, B. dropping one on each side of the ditch. Jack was sent for the one on the left, and Mac across the ditch for the other, which was only winged. He mangled it badly, then dropped it and refused to pick it up. Jack had not yet found his bird, but was recalled and sent over after the other, which he brought, and then without being ordered returned after his own, which he had marked fall, and after a long search among mud and water, unaided, found and brought it in perfect form. At this point W. expressed a willingness to pay all dues, and stated he would like to get a few birds as best he could. Owing to their scarcity and wildness ten only were secured, but the amount of amusement it afforded, as the good-natured although sarcastic remarks passed between the rivals, then, and later in the evening, when with dry socks and slippers the events of the day were rehearsed around the cheerful hearth among a number of congenial spirits, was ample compensation for the labor through the mud and water during the day, and such a time was had as leaves no regretful feelings and such as is seldom enjoyed excepting among the genuine and practical sportsman. JOHN DAVIDSON.

MONROE, Mich., May 6.

POINTERS AT THE NEW YORK SHOW.

Editor Forest and Stream:

When I asked of you the privilege to write a few lines about the pointers and the judging of the same at the New York show, and when that privilege was so courteously and cheerfully accorded, I felt that the time had arrived for those who love these handsome dogs, and who have spent years of valuable time endeavoring to improve them, to come to the front and fearlessly and impartially criticise their merits and demerits. To allow mistaken views to predominate, or to permit errors of judgment to be placed on record unchallenged and unheeded, is to impede progress, shatter the standard, and stultify the very object for which dog shows were instituted.

My remarks will apply to dogs, not men, and if any of my brother lovers of pointers can show errors of judgment on my part, I shall be pleased indeed if they will do it. Impartial criticism of our pets is conducive to improvement, and improvment is the primary aim of a sportsman's journal, while it should also be the first consideration of good dog lovers.

So much has already been written and said of the judging, that I will simply add it was the worst I have ever seen during my experience as an exhibitor, either in England, Scotland, Ireland, Wales, Germany, France or America. My remarks on the various dogs exhibited will show why I arrive at such a conclusion.

Twelve months ago I alluded in these columns to the fact that pointers were degenerating. In my opinion marked improvement has been wrought during the last year, and if due care is exercised and intelligence brought to bear on breeding, I shall soon expect to see the pointer of this country take rank second to none, either on the bench or in the field. There is no earthly reason why a good dog should not also be good looking. Such dogs I have seen, and there is as good fish in the sea as ever came out of it. Mr. Price's beautiful dog Bang was not only the best looking pointer of his day, but a great field dog and the best sire ever known. The incomparable Wagg was a field trial winner, and my old favorite, Don II. (Wagg's only brother) not only won first in the field, but scored the highest honors at Birmingham and elsewhere, after which he sired that typical bitch Prude II. Hamlet and Rap were handsome and good in the bargain; Rap was the best looking, Hamlet the best workman, both were great stud dogs. I could name a score of others that have distinguished themselves in the field, on the bench, and in the stud. What has been done so often may surely be done again, but discretion must be used. It is a notorious fact that the best looking dogs have been produced from large dogs of great bone and substance, crossed on small size bitches, and breeders of pointers should bear this in mind. By your courtesy I will place before the readers of FOREST AND STREAM at an early date, a description of what I consider a typical pointer should be, and at the same time I will give a few hints to those who may not have had a long or varied experience with the breed. Without further preamble I will come to business.

Eight champion dogs make a good class, especially so when most of the cracks are out.

Tramp, the sturdy-looking son of Sensation and Psyche, is not the type of pointer I have been educated to admire. He is wanting in true pointer character, is coarse in head, faulty in back and round in barrel. He has plenty of bone, his best point.

Joe (Munhall's) has a beautiful chest to recommend him, but he is snipy, light in bone and faulty in feet—a serious defect. He carries his tail too gaily, and there is a something wanting, the absence of which is easier missed than explained.

Meteor, the winner, has a head which, if brought under the notice of such judges as Whitehouse, Price, Lort, Brierley and others, would disqualify him. His shoulders are straight and his feet not good. He is short in the back (the pointer is not a short-backed dog) and too long on the legs, and if followed behind when on the chain he will be found to be "stilty." He is not nearly so good a looking dog as his sire, Garnet, never by us considered to be a typical dog, though he was a workman. He has a fairly good neck, a good coat and a well-shaped tail, which he carries at times very badly. He is not a show dog, and all the newspapers in America cannot make one of him. Father Time will, I think, prove this opinion to be correct.

Knickerbocker is a better type of dog than the winner. He has a pointer's head, fair good legs and bone, but is faulty in back, stifles, tail and neck.

Don, the well known champion of many a hard-fought battle in the field, is too coarse throughout for a show dog. Lack of quality is his fault. He is a well bred dog, and should prove invaluable to cross on light-boned weeds.

Croxteth was looking his best. My opinion of him has often been expressed, but he is a better dog than the winner, and I told his keeper so before the class was judged.

Perth was in very bad condition. He has a fine chest, shoulders, legs and feet; also, a nice clean neck; but he is bitchy in head and has a coarse, high-carried tail.

Beaufort I must not criticise for obvious reasons. A description of him from my pen, before I owned him, appeared in FOREST AND STREAM nearly twelve months ago, and to the same must I refer your readers.

In the corresponding bitch class, my old friend Water Lily won. She was shown too lusty. Her faults are badly-carried ears, lack of bone, a low set on tail and faulty stifles. She deserved her blue ribbon. Nan is a bitch with a fair good head and abundance of bone. Faults: badly-carried ears, heavy shoulders, washy color, drooping quarters and round barrel. Old Grace was as playful as a kitten, notwithstanding her twelve years. She never was a show bitch, though she has won prizes. Her clean neck and excellent feet, however, attract attention, and she has the reputation for throwing better puppies than any other bitch in the country, besides an undeniable field record.

The open large dog class was a great improvement over that of last year, but was, in my opinion, wretchedly judged. Fritz, placed first, is a grand "little dog," and if reduced in weight a pound or so, he will show a clear pair of heels to any small pointer in America. He has a good head and ears, perfect legs and feet, lots of bone, and a well placed and well carried tail. Depth of chest would improve him. Drake, placed second, was not entitled to the honor; it really belonged to his kennel companion, Sefton, a decidedly better looking dog: he beats Drake everywhere excepting in head and neck. Sefton is a little sour in expression and light in eye, he is also throaty, but he has good quarters, and he stands on capital legs and feet; he is a better looking dog than his sire. Drake has a slack back, bad loin and faulty feet, which are failings I cannot tolerate in a pointer, or, indeed, in any sporting dog. Thurtle (Mr. Godeffroy's kennel man) indorses my opinion that Sefton is a much better looking dog than Drake. Scout, also by Croxteth, is faulty in back, loin, and feet, besides being plain in face. Pilot (Littlejohn's) is a trifle strong in head, and is heavy at the shoulders, but he is good in bone, middle and stern; he should have been third. Donald II. (Munhall's) disappointed me much, and will never do credit to his illustrious sire (Donald), being shelly and long on the legs and having bad shoulders. Danby (Rutherfurd's) has a fair good head, but is leggy and plain. Maxim (Munson's) was in luck's way to get a vhc. card; he has a coarse, heavy head, bad ears, neck and shoulders. Bang (Munson's) is a well bred dog, and one that should get good stock from certain bitches; he is a much better type of dog than Maxim, but with age he grows coarse. Guy (Stromberg's) is full in the cheeks and heavy at the shoulders; he was not well shown, but can always beat Maxim. Icicle is not a show dog in any respect.

The open large bitch class was a poor one. Miss Merryman won and was rightly placed. Faults, ears badly carried, throaty, little too wide in front, and coarse in tail. Legs, feet and head fairly good. Fan Fan (Donner's) placed second, has a fair head and tolerably good feet. Faults, throaty, wide in front, light in bone, and too round behind the shoulders. Sal is not good, neither is Lady Mac, who is very stilty behind.

In the next class for champion small dogs, Bravo (Appold's) won, and to him should have been awarded the small size sweepstakes. From eye to nose he is decidedly weak, and he is too round in the barrel. He has a good neck, splendid legs and feet, a good loin, fair back, and a good tail, which he carries well. He was the gentleman of the small size classes without doubt. Ross, in the same class, is a fair, good dog, though wanting in pointer character. He is light in bone and fine in muzzle. Dick was outclassed. He shows age, and is faulty in cheeks, neck, chest and tail.

The corresponding bitch class was not well judged. Vanity (Munson's) was not entitled to premier honors. She has a plain head, badly carried ears, is out at the elbows, and carries her tail away over her back. The judge seemed to have a weakness for ringtails, but I for one have yet to learn they are pointer attributes. Duchess and Lady Bang in this class can both beat Vanity easily. I do not like the black eyes and nose of Duchess, nor yet her shoulders and carriage of tail. Her gait, too, is not quite *comme il faut*, but she clearly beats the winner. Lady Bang shows her good breeding. She is too full on the brow, throaty, and light in bone, out of much better type than the winner.

I never have seen pointer classes handled so badly as were the next two for small-size dogs and bitches. Had the judge been asked to select the worst dog in the class he could not have succeeded better than when he placed Pride (Tallman's) first. He was absolutely the worst dog in the class, and should not have been noticed. He is wide in front, has crooked forelegs, with feet twisted out (as seen in the dachshund), splay feet, a weak back, and bad loins. Second prize was awarded to Fritz (Collins's), another grave error of judgment, in my opinion, and one which surprised nobody more than the owner. Fritz has a plain face, a light eye, bad loins, and a coarse tail. He has no pretensions to show form, though his shoulders, legs and feet are fairly good. He is a wonderful trick dog, which was possibly taken into account by the judge. Third prize went to Don (Crane's), also a mistake. He is wide in front, has a plain face, light eyes, bad quarters and tail. The best dog in the class was Heath's Dash, a nice lemon and white of good quality. He was not even commended. Second should have gone to Booths, good in body, legs, feet and stern. He has a fair head, and is a little heavy at the shoulders and wide in front. He was clearly entitled to second place. I would have given third prize to Bob (Amory's), by Bang—Princess Kate. He has fair head and ears, good body, legs and feet. He is too wide in front and carries his tail badly. Puck, owned by Dr. Wells, should have received the vhc. card, though faulty in shoulders and a little light in eyes. Match (Cornell's) is bad at both ends. He has a good neck and a fair middle.

In the bitch class, the Neversink Lodge Kennel's Jilt won, and was properly placed at the head of affairs. I cheerfully admit that I never expected to see Croxteth sire so good a bitch. She is a trifle fine in muzzle and inclined to be throaty for one so young. She is also too wide in front and a trifle slack behind the shoulders; nevertheless she is a good one, and had I been judge, she would have won the special for best pointer bitch in the show, as the winner, Vanity cannot compare with her. Vision, though by no means a bad bitch, did not deserve second prize, which was clearly won by Belle (Gregory's). Though Vision has a fair good head, neck, legs and feet, her loin is bad, as is also her tail and the carriage of her ears. Belle is a good bitch, a little weak in head and coarse in tail. Flash III., to whom third prize was awarded, is not a show bitch, and her place should have been occupied by Lyde II., winner of first at Washington, or by Rose (Williams's), who is also a much better bitch, though she does carry her tail badly. The faults of Flash III. are heavy shoulders, splay feet, crooked legs, round skull and snipy muzzle. Her ears, too, are badly carried. The skull of the pointer should not be round, and the muzzle should be long, square and blunt. CHARLES H. MASON.

NEW YORK, May 19, 1884.

BEAGLES AT NEW YORK.

Editor Forest and Stream:

I presume that the Westminster Kennel Club see the mistake they made by accepting a different judge to make the awards in special prizes for beagles, and will not allow it at future shows, but have one judge for all classes. I do not believe it was the desire of the Beagle Club to have a separate judge if it could have been properly considered, and I would like to ask the president of the Beagle Club who made the nominations?

I was not aware that the club would nominate and vote for a special judge until I received the printed nomination. Of course I did not vote, and if there had been time would have strongly opposed it, believing that the Westminster Kennel Club are competent to select and appoint their judges; and if they had considered the matter I feel certain they would have had only one judge, and hope in the future that they and other managers of bench shows will have but one judge for all beagle classes; but hope that the judge will be instructed to judge according to the standard of our club, and that our president will try to have judging at future shows governed by our standard. Perhaps it will not be out of place to say that Mr. Mortimer indorses our standard (with perhaps one exception), and I could not see why he did not follow it as well as possible in making awards except making note of points. While I will not draw any comparison between the two judges, will say Mr. Mortimer's judging was consistent, and regret that Mr. Sloan should have reversed Mr. Mortimer's decision, irrespective of the fact that Mr. Mortimer had the dogs placed right.

In your report of the show you say, "The beagle class was well filled and of better average quality than has yet appeared at any of the Westminster Club shows." Then speaking of Bush that won first in champion class you say, "The winner, Bush, is a fair average beagle." Now it is not quite clear to me how this fair average beagle (Bush) could win champion prize in a show where the quality averaged better than at any former exhibit, and when she had for a competitor a beagle that had taken first prize at Lowell, first and special at New Haven, third at Toronto, vhc. and special at Cleveland, and of whom FOREST AND STREAM had said, "He has a good head and plenty of bone," and Bush also won first at New York, 1882, in puppy class, and first and special at Pittsburgh, 1883. This fair average beagle has certainly been very fortunate, and it looks to me a little as though FOREST AND STREAM got a little of the mist that was so abundant during the first three days of the show into its brain and could not see clearly.

In regard to your comments on Chase and Deborah I will only say, that much as I dislike to say anything against my friend's beagle I cannot avoid it, but will be brief and only touch a few important points.

I agree with you in saying that Deborah has the best muzzle, being the squarest cut, but in many other points Chase is far her superior; has much better length of ear, they are hung better and fully as good in regard to width, her coat is better, Deborah's being a little too short and lying a little too close, and Deborah has very little brush on tail while Chase has plenty. The general expression of Deborah was very puggish and she lacked the hound-like expression that a beagle should possess. N. ELMORE.

GRANBY, Conn., May 19.

ENGLISH AND AMERICAN FOXHOUND.

IT is evident, judging from the specimens of both English and American foxhounds exhibited at the late show of the Westminster Kennel Club, at Madison Square Garden, in New York, as well as at the other numerous displays throughout the United States, that the two animals should not be placed in the same class or judged by the same standard. They are now as separate and distinct as are the pointer and the Dalmatian. The English hound having been crossed and recrossed with other breeds to give him both courage and speed, has lost all vestige of his former outline, and notably failed in his scenting powers. While the American dog, descending from the old Southern hound, brought to this country by the Cavaliers of Virginia and Maryland, has been kept pure without a cross and to this day shows his clear origin and typical characteristics. The several breeders of foxhounds in this section, as well as owners of working packs (I do not refer to anise-seed bag work, but the chase of the fox), who have all at different times imported the English foxhound with a view of making a fair comparison with their own dogs, and to cross them if advisable, have in every instance discarded the Britisher and declared him inferior. Mr. Howard Lewis, a prominent member of the Rose Tree Hunt, has made the experiment, and both Messrs. Shaner and John Yerkes, breeders of this section, will not allow an English dog in their kennels.

Mr. Lort, while at one of the Westminster Kennel Club shows, acknowledged to a prominent Philadelphia fancier that the English dogs had sadly degenerated and did not possess the nose the breed once had, and remarked that another cross would have to be looked for in order to recover the ground lost, and named the otter hound as the only one they could go to in England. The writer has knowledge that Mr. Lort would have taken back with him a pair of very fine black and tan hounds of Mr. Yerke's breeding, had the owner, Mr. Laudenberger, been willing to part with them. There is no pack of foxhounds in England that does not now require the whipper-in, in order to be kept on the scent of a fox. Show me an imported animal that can keep up with our own hounds on the trail of a fox which takes as his course of flight first the woods, then the swamp, and then the rocky hillside. I am told by fox hunters who have tried the English dogs here that they have seen him "show up" and lose their fox in the open field. Our own dog may not have the speed and dash of the Britisher, but he has the qualities we need for this country, a keen nose to follow and stick to his fox in all kinds of ground.

It will take but half an eye to discover that the English foxhound and the American dog are different in conformation and should not be placed in the same class at shows. The former, in my estimation, has decidedly a cur look, shows his coarse lines, rough coat and the crosses that have been resorted to, while the latter has a thoroughbred appearance, a true hound savor that has been given him by the old Southern hound, from which he is descended. We need just such a dog in this country, but the English dog is useless here and has proven such. Why, then, take him as our standard and award him the blue and red ribbon when, in my mind, at the late New York show the first prize should have been given to the exhibit of the Blooming Grove Park Association? It is hoped that the attention of foxhound breeders will be drawn to this subject and their views made known in the FOREST AND STREAM. It would be very interesting to your readers if both Mr. Howard Lewis, of Media, Pa., and Dr. Hydekopher, of Philadelphia, could be induced to write upon the subject, as I know of no persons better posted on the American breed of foxhounds. HOMO.

ENGLISH KENNEL NOTES.

THE success of the Warwick show, which closed on Friday, the 18th inst., is the chief topic of conversation in the dog world. It was not difficult to foretell its success; they had all the elements of that quality to start with.

The show presented a very pretty *coup d'œil* on entering. There was ample space to promenade between the benches without leaving samples from your tailor in the inquisitive jaws of the exhibited.

Spratts did the benching and Jeyes the disinfecting. I have one grumble against each of these firms. Messrs. Spratt by this time should surely know what space the different breeds require, and yet some of the classes were so uncomfortably situated in room that they could not turn round. With regard to Jeyes, I cannot understand why they prefer to use their liquid instead of dry disinfectant. The effect is to make the place sloppy, and most objectionable to visitors, being ruinous to their boots and dresses. The powder is equally efficacious.

I must admit that I heard more complaints than usual about the judging, especially of the collie and mastiff classes.

The judges of these classes were Messrs. Radcliffe and Portier. The first named struck me as being very painstaking and very conscientious, but I think his knowledge of the breed is hardly profound enough yet to enable him to deal with such large classes containing so many new lights. He was unconscionably long over his work, and seemed to hesitate, weigh and consider where there was really no doubt, and every collie man round the ring had made up his mind, and then when he did decide, the result was usually a surprise to the onlookers.

There is a deal in "how" one judges. You can be too careful, if you hesitate till you are lost in doubt and confusion. There are many methods and means of arriving at the best dogs, but I think the simplest and surest is the weeding out principle. If twenty dogs file into the ring, there will be at least six so conspicuously bad that you can turn them out as they come in.

Having got all the class before you, nicely round the ring, be careful that your ring-steward has not left any sitting on the bench, which is an injustice that often happens to dogs at shows unaccompanied by their owners, who are chagrined at the defeat of their dog, which may never have been led out before the judge. In your first survey you will probably see another four good enough to leave.

Now you must begin to be careful if the class was a good one. These ten will require a careful looking over, so first trot them round the ring; this will show you the halt, the lame, and the blind. If any of the exhibitors should feel his pride hurt by the circussing, and resent the walk round, promptly give his dog to a keeper to lead, and if he object to that, order him out of the ring. I would show no consideration in such a case, because if on account of the clumsy way in which his loutish owner showed the dog, you overlook him, and he turns out to be a good one, be sure no mercy will be shown to your blunder.

Well, here are the dogs walking round. "Hullo, out you go there with the broken off foreleg." "What did you say, Mr. Exhibitor, only noticed him walking stiff this morning, ah, really, what a very unobservant man you must be, take him out." "Gad, how badly that one moves, bring him here, please; let me see his teeth (always let the owner open the mouth), yes, very old, and must have been a grand dog six years ago, but every dog has his day you know, sir; I will give you the highest honor short of the coin, and of that he has won plenty at other shows—vhc." So you have got some room, only eight, and you think you can see the winner already, but don't be in a hurry, lead up to him.

Now for the individual inspection. "Fair head and coat, short in the couplings rather. Don't hit your dog, sir, I don't mind his jumping up, give me your stick. Here dog, pst! fetch it! Good cars; hullo, look at his tail right over his back, that's what you wanted the stick for; eh? to keep his tail down, sly dog, but he's worth a c. card." Seven left. "Decent all-round dog, this one a bit slack behind—trot him up there in front of me; hem! I thought so, inclined to be cow-hocked, hc." Six. Sit tight and play up, how anxious that tall man looks, and that keeper ought to have his neck screwed for the little interest he shows in the job. The very confident cocksure-looking gentleman thinks, "——, can't lose to-day." Well, we'll see, but you are looking at the wrong end of the chain.

"Whoa, there. Savage, is he? Then why didn't you say so? Coarse throughout—another hc."

Five. Yes, there's no doubt about him. "Put him up in the corner." Confident man much surprised he is not sent to follow, but affects to look unconcerned, which doesn't go far to reassure his wife, who now glares at the judge, while the keeper, with the swell of the party in the corner, listlessly converses with a pal over the barrier. Now these four. "Very characteristic dog." You like him? "What a coat; but that head. Well, you are not far out of it, sir. What is your number? Thanks—vhc."

Three and one in the corner. "Yes, he's a devilish handsome pup. Entered in the puppy class, too, is he? Ah, well, well! Well, he's hardly made up enough yet—vhc. You'll never do worse. In a few months he'll carry you into the money."

Two and one in the corner. "Here, you fellow, bring that dog out of the corner." Where's your ring, steward? All the people have got under the barrier, and are crowding round you and the three dogs in their anxiety. "Stand back, please."

"Gallop them round." What action that dog has. But the swell still leads. "Stop! Bring him on the board. Good head; something wrong about the shoulders—heavy rather; chest could be narrower, too." "Bring the other two on the board." "Feet not so good as theirs, either." "What did you say? Took first prize at Carrabas? What's that to do with me, sir? A very improper remark to make to the judge. I have half a mind to turn you out of the ring. What have I given you? Good advice, sir, but your dog I award third prize to."

And out he goes with the proverbial lively insect in his ear, which will tingle for the next half hour. Come, now, here's the tug of war. You still like the look of the swell, but take it quietly. You know the other is a famous dog, been doing a lot of winning, and you have never seen the youngster before. Well, give him extra attention, then. Head perfect, legs straight as pillars, coat flat and straight, splendid quarters. "Yes, he's a nailer." Put them alongside of one another. Not much to choose; more quality in the young one perhaps—yes, by Jove, and more character; color not so pleasant as the other, but the texture of coat—let me feel the other's—rather much better.

"Only second, sir; well, you ought not to feel ashamed of being beaten by this lovely animal." But the confident man is very much annoyed if he isn't ashamed, and sneeringly repeats your observation to his indignant spouse, who buttonholes him at the exit, and they walk away together consoling themselves by remarking that "they suppose you bred the winner or sold him; that's it, of course, what can you expect, and after all what does he know about ——s?"

All the crowd are looking at the winner. Who's this impetuous young man rushing up, elbowing his way and asking excitedly, "Where's my dog? I missed my train and they say the judging's over. Hullo, keeper! what did he do? First? no, hurrah!" and up goes his hat, and the crowd smiles, the keeper looks happy with half a sovereign in his hand which he didn't earn, and the mad-with-joy exhibitor, whose first entry this was in the show world, "bred him myself? rather, of course I did!" walks proudly out, leading the swell and feeling that every eye is on him, and so they are.

Well, but look here, this did not happen at Warwick, so adieu, imagination, and return hard facts. I was talking about the new judges. The other, viz., Mr. Portier, I have an idea has judged before, but I don't remember where. This is the gentleman who writes very long letters on black and tan terriers and mastiffs over the *nom de plume* of "Anglo American." By his accent he is French, and that may be why he was chosen to decide upon merit in the foreign classes, but why mastiffs?

Oh, wait a bit. I notice the British Kennel Association, which I understood was in difficulties, comes down handsome in prizes in the mastiff classes. Envious people might dwell on the flush. Mr. Taunton is the B. K. A.; Mr. Portier is his Fidus Achates (*Arcades ambo*). Cardinal beat Crown Prince for the stud prize.

Not one suspicion do I cast upon Mr. Portier's strict probity, and I can say more, that I feel confident that the above award was an honest, independent and conscientious one, but none the less when the atmosphere of the kennel world is so thick with sharp practice, shady doings, etc., no handle should be given to the party of "envy, hatred, and all uncharitableness."

What others and I may call courage, Mr. Portier's good-natured friends may term partiality.

I think Mr. Portier was plucky to put Mr. Beaufoy's Pontiff over Crown Prince, and I also think he was wrong. Compared to his highness the papal one is small, but very massive, he has a short square head, plenty of bone, and is fawn gray with a black mask. It is true Crown Prince has a flesh-colored nose and fleshy linings to lips and eyes, but stand him up side by side with any other mastiff alive, and see how he "towers."

Crown Prince is a grand and imposing brute, his head is full of mastiff character, and at stud I know few dogs that have so improved their breed as this splendid creature. There is the type of the sire about all his "get," and you can walk down the bench and say "that's by Crown Prince, and that, and that."

Mr. Taunton and Mr. Portier seem anxious for the preservation of brindle mastiffs. I don't see the necessity, if their color is to be all and all, for a more miserable, half-starved, under-sized lot of yard-dogs I never saw than in the two classes devoted to brindles at Warwick. I don't like the color, and think a brindle must be a very good one to win; the color makes them look mean and insignificant.

Cardinal is the best I have seen since Wolsey, but Cardinal's head is very plain and unwrinkled, and he looks light against the fawns. Orlando, who was also on view in the champion class, was out of his depth. He has a rare head and should have a lot of weak, snipy-headed bitches sent to him. He has a peculiar fault. His hind legs are very straight and he stands inches higher behind than in front. I don't know whether a dog would or could transmit such a blemish to his progeny.

The champion bitch Rosalind is by Crown Prince, and a beauty she is, on the small side perhaps, but much quality. Taken all round I considered it an exceptionally good show of mastiffs. As an Englishmen, I cannot help feeling gratified to see a native breed holding its own against foreign invasion. A big mastiff on good legs is an imposing, comforting companion, but a moderate mastiff is a wretched thing—that is where some of the other breeds have the advantage, for a moderate St. Bernard is still a handsome companion dog.

The mastiff's rival though is the boarhound, but I was not impressed with this class. Sultan II. was allowed a walk over in champions. He is a monster, but his head is weak, jaw too pointed and fine. Mr. Martin's Nero won easily in the open dog class. Nero is one of the giants, and has fulfilled the promise of his puppyhood. He is a light-yellowish color with a few stripes in it, he stands on wonderful forelegs and was shown in the hardest condition. I should describe his faults, common head for so grand a body, and an unpopular color.

Prince Charlie, second prize, is a poor "tiger" with a good head. I liked the black Thunder almost, if not quite, as well. Mrs. Hazlerigg's black bitch Peeress has a perfect long head, and well merited her honors. The puppy winner, Leal, is a splendid fellow and remarkably furnished for his age. I like his color, a deep, dark brindle. I observe that he is entered in the catalogue "age eleven months, breeder and pedigree unknown." That always puzzles me where they get the age from if they don't know who bred him, in whose possession he was born.

I noticed a case in the Newfoundland class that struck me as ridiculous and unjust. The classes are divided into black and other than black. Most of the black dogs, like all self-colored breeds, have a little white on the chest and often some on the hind feet. This is not liked, a little is tolerated, but much would be disqualification. Now mark the ingenuity of the owner of a dog named Trojan. This dog is black, but he has a lot of white on his chest, therefore he is a disqualified black dog, but his owner then enters him in the other than black class, which is unjust to the exhibitors of the Landseer type, for this Trojan has no white on his head or back. It is cute.

Mr. Mellor made a great mistake in the Landseer class when he put Seaman and Admiral Drake over the beautiful Charlemagne. Since Evan's old Dick, I have seen nothing that so nearly approached Sir Edwin Landseer's picture of a "Distinguished Member of the Royal Humane Society" as this Charlemagne.

On the whole, though, I think most dog connoisseurs prefer the blacks. Newfoundlands have suffered the most from the advent of the St. Bernard, but there are still sufficient fanciers to preserve them from extinction, and while there is Gordon Stables there is hope.

The champion deerhound prize looked a good thing for Mr. Percy Cooper's Bevis on paper, but Cuchullin won on form and condition. The winner is a dog of conspicuously aristocratic appearance, with thin, long, snaky head, and blue steel coat. Chieftain looked unkempt against the other two.

Pointers were a nice class, Devon Sam won and took the cup, I thought he looked good enough to claim at his catalogue price, 50 guineas. His owner won again in bitches with Devon Fan, priced the same.

The judge could not separate those two beautiful dogs, Ganymede, the Irish, and Sir Alister, the Laverack setter, so he divided the champion prize. As all the champion classes were on the sweepstake plan each won his entrance fee, there being only two entries. Sting, by Emperor Fred, bred by Lord Downe, won in dogs, another £50 dog. Sankey got second honors. Blue Maud, by 'Tam o' Shanter, followed up her Crystal Palace luck. In the Irish division two dogs, by the champion Ganymede, were first and second, Lismore and Tyrone.

In wavy retrievers Mr. S. E. Shirley's kennel carried everything before it. Both champion prizes, first and second in dogs, and second in bitches. His three winners in the open class being out of one litter by Zelstone ex Think, born March, 1883. Will he be able to breed another such litter from the same parents? I doubt it, have seen it tried repeatedly, and failed.

Mr. S. Darbey was, as usual, to the fore in curly-coated retrievers, a far more interesting variety, in my opinion, than the wavy, the latter have a Newfoundland air about them, whereas the curly are a very distinct and peculiar breed like no other dog under the sun. A good curly retriever is an extraordinary sight, with its short, close, springy corkscrew curls. Chicory II., first in bitches, looked cheap enough at £21.

The most extraordinary dog in the show was the Clumber spaniel Boss. He is not a year old yet, and is the finest I have seen. His body is enormous, and if you come up to him lying down you would take him for a big dog, and then to see him stand up on such impossibly short legs is quite surprising. His coloring and coat are beautiful; his coat has that peculiar appearance as if the atmosphere held it up, it looks so light. This effect is only noticeable in Clumbers and English setters. I dare say Boss was claimed. His sister Doll, also a beauty, got vhc. in the same class.

Brida II. is a grand colored golden liver, and a big one. The invincible Miss Obo was returned champion again. She is the very model of a black spaniel, quite a picture, and I don't think a mistake was made when she was claimed at Hertford for £150. She is entered "not for sale" now.

I asked a friend to go round the collie classes with me, and he says the quality was superb. Charlemagne was there, and it would take a strong-minded man to put the old champion anywhere but first. His son Eclipse was next best (he looked as if he had had a swim in the morning), and then came Rutland, a black and tan dog, rather short in the couplings and otherwise lacking freedom. Donald is not worth mention.

The open classes were so large that the judge divided them into sables and black and tans. Lord Clyde, faulty about the head, won in sables. This was a dreadful mistake, for by far and away the best sable in the open and puppy classes was Mr. Pirie's glorious dog pup The Scot, who is remarkably like his sire Eclipse in face, color and coat. He only received third prize in both classes. Red Gauntlet also, only vhc., I thought should have beaten the winner. Then there was a gray dog, Scottish Hero I think his name is, who could win in any company. Bar color, he is a very typical sheep dog.

For the bitch prize it looked "a cornucopia to a cabbage-net," as Pierce Egan says, on Mr. Krehl's Beatrix, a rich-colored sable half-sister of the same owner's Eclipse. It must have astonished the other end of the chain when she got only vhc. This was a most unaccountable decision, but I expect to see it upset when she is next brought out. Flurry won, and she is a pretty bitch, a bit wooden if anything. Miss Charlemagne (a very vulgar name, by the way) I could not stand at any price, she is only a nursery toy.

In the next class a pup, The Squire, beat Lord Clyde, the open dog winner. Mr. H. W. Thompson, the celebrated collie judge, cleared the bench with his smooth champions, Guelt and Yarrow.

I have just read an extraordinary letter in the *Field*, by Hugh Dalziel, on the Hertford distemper case last year. He makes some damaging charges against the Hertford and Kennel Club committees. But there is one sentence about a member of the K. C. committee, Mr. Percy Reid, that will require explanation or the club will have to take action, unless they want public opinion to take it up.

To return to the Warwick show. I was delighted to see so good a fancier as the Rev. A. Carter with such a grand St. Bernard pup as Plinlimmon. When full grown and made up there's not the dog born that will hold him safe. I quite expect to see him develop into as large a dog as Rector and a much finer type of the breed. Plinlimmon's head has the kind, benevolent look that is so essentially characteristic of the St. Bernard; it appears a little long and fine from the eyes to the nose, but then with age his muzzle will broaden and square up the head. His body cannot be criticized—color and markings are perfect. I much prefer his orange tawny color to the brindles.

Mr. Smith is generally in the prize list, and he was to the front again here with a new dog named Valentine. Although rightly first in this class I don't think he is quite of the first water. His head is very massive and full of expression, owing to the black under the eyes. He has no dew claws and his color is objectionable; it is a mousey gray. Faust was second; he is well known to show-goers; his expression is rather sour, and the coat curly, otherwise a fine, big dog. Valour was vhc. He lately changed hands at a stiff figure and now belongs to Mr. Sweet. I hardly think Valour fills Turk's place, and if I were Mr. Sweet I should rather see Turk back in my kennel than its present occupant. Turk now belongs to a Northern fancier, who, I hear, is doing remarkably well with him, and sees the guineas (about sixty, I believe,) he paid for him rolling back merrily in stud fees.

Turk's stock compares favorably with that of some of more fashionable competitors. Pilgrim also, who has long been at stud and must be getting an old dog now, has distinguished himself and sent up his value in begetting Plinlimmon.

Phantom is another from the kennel lately sold off by Mr. Fox. He is fit to compete in any company, and was rather unlucky on this occasion.

The open class for the fair sex contained no surprises. There is room for a good bitch. The lucky claimant of third prize, Countess of Beaufort, showed his judgment without much hesitation. Had I been a St. Bernard breeder, directly I saw her I should have broken my neck in my haste to get to the office and claim her for £31.10. If she be put to a suitable dog I would like to lay odds on her litter against anything else that may be bred about the same time. She is built to breed from.

Her brother Silva was awarded second prize in the smooth dog class. He shows lots of character, but is frightfully cow-hocked.

Mr. Kaye exhibited a dog in the puppy class called "Rt. Hon. W. E. Gladstone," I don't know if Mr. Kaye is a member of the St. Bernard club, nor what authority that body has over its members, but if it possesses any, they would be well advised in using it to give the owner of this dog a lesson in good taste by putting their veto on such vulgar nomenclature which is calculated to make a noble breed ridiculous.

Thisbe, the winner in the bitch puppy class, will credit her owner, the Rev. A. Carter, with as many winning brackets in the future as her kennel mate Plinlimmon. She comes of a rare-headed stock.

The bull bitch Rhodora walked away from her class and has now deserted her country. She will be your side of the pond by the time these notes are in print. It will have to be a good one that, during this show season, can lower the colors of Monarch III., who won very easily. Mr. Berrie (not Berril, as misprinted in my notes of the 10th ulto.) was the judge.

Cairo only beat Count by the skin of his teeth for first in over 25 pounds bull-terriers. The same fancier whose name conjures up old memories and anecdotes of his father, "Bill George," was successful again in the smaller class with Grand Duchess.

I was quite unequal to going through the fox-terrier classes. It splits your head to stand anywhere near them, their short, quick barks go through your brain. I was glad to observe more terrier character about the winners than at some shows, the very long, thin head often softens out the desirable wicked look which is altogether indispensable in a terrier.

Beagles were a very small, but still a pretty class. Mr. Hoig was not so fortunate here with Mariner as at Aston, where he won first prize to the incredulous astonishment of his owner. Nothing could beat the Brummagen winner, Abigail, but Mariner was second best.

The position of the beagle in this country is seriously threatened by the increasing attention paid to the French basset hound. With a love for all things English, I cannot help feeling sorry to see a home breed being pushed out of their position by the foreigners. Candor, however, compels me to avow that I do not wonder at it. It is the fault of our beagle masters that they for years have bred too large. A fourteen-inch beagle is now considered an average hound, and I know very few men can live with them. You must be in hard training and as fit as a fiddle if you want to see any fun with a fourteen-inch pack.

I am generally pretty tough, but I shall not forget my last day with the beagles. When they went away I was well up till they got on the flat, and then came the pace; it was a sprint speed. Excited with the ardor of the chase, I ran like a hundred-yarder till I dropped, and there I lay on my back thinking the end of the world had come. By the time I had got my breath and was able to sit up I saw the lad who was carrying my coat and flask puffing along in the field behind.

"There they are, sir," he gasped, pointing to the small bunch of white, black and tan, as they swept along in the distance, their music from afar sounding very low and sweet. But I had already concluded this hunting didn't pay. "Yes, and here am I," I said, "and those will continue to be our positions till puss is broken up or lost." So putting on my coat, I clambered with the lad's aid, up a pollard. After a long, strong pull at the flask, the land that reared Scotchmen earned its forgiveness when it produced whisky. I settled myself down to the beautiful view. From this point I saw most of the run, and as I write I almost feel the cool breeze playing round my temples and see again the peaceful landscape and the little pack merrily bowling along.

But what has become of our twelve-inch beagles? Honestly measured, I mean. Stand them on the level, hold their heads in a line with the body, and then lay a flat rule across the shoulder blades; from the point it touches the wall to the ground is the proper height. That is correct hound measurement. Where are the packs that could Indian-file past a beaver hat without topping the brim, "and you can cover them with a sheet, sir, by Gad!" Where, indeed,

"All gond avay in de Evigkeit,
Avay mit der Lager bier,"

unless you have got them in America. And where will you find a nine-inch beagle now, that is not a shivering toy?

I have one in my memory that I saw years ago. I was riding from Battle to Hastings, when I noticed sitting before a small house on the doorstep a picture. His hound markings were perfect and bright, but his face was inexpressibly sad as he sat dreamily blinking in the warm sunshine, now twitching one ear then another, as worrying insects spinning around his head alighted there for rest and inspection. I was sorry to disturb him, and still more sorry after carefully handling his symmetrical body to have to ride away without him. "Don't ask me to sell him," was all his owner said, and I hadn't the heart to do so.

I have read in old French works of a pack of little hounds that were famous in France before the Revolution. They were so small and so pretty that the people called them the "porcelain" hounds.

In my inquiries for the whereabouts of small beagles I have quite forgotten my own. So back to Warwick.

Basset hounds are next in the catalogue. Looking at these heavy little dogs on curiously short, thick, crooked legs, one can understand the favor they find with those who love to follow on foot. Their note is as deep and musical as the bloodhound's, I understand, and one can quite believe it when one observes the similarity of the head properties. The same hanging flews, the dewlap, etc.—the descriptions of the head points of these two breeds must be almost identical. I don't know the average height of these hounds; I will take the first opportunity to find out and mention it in these notes. The beagle class had six entries, the basset fifteen—this speaks for itself.

I observe the *Live Stock Journal* reporter, a Mr. Gresham, who once kept St. Bernards, says; "Fino V. had no difficulty in disposing of the Basset hound dogs," whereas a lady who was present and watched the judging tells me he was a very considerable time over this award; that he had Bourbon on the platform with Fino V., and from the anxious appearance of the judge he seemed to have a very difficult task to separate the brothers of the same litter. This shows how little value one should attach to these "hack" reports of dog shows.

Mr. George R. Krehl seemed to have it all his own way in the bitch class; in fact, looking through the prize list, he appears to own or have bred all the winners.

There was a nice show of Bedlingtons. They are a quarrelsome, hardy lot, regular miners' dogs.

Mr. Harding Cox gave the prizes in the harrier class, and being the only exhibitor, won them all himself.

He is one of the few independent and representative members of the Kennel Club Committee. A glance through the catalogues will show that he has "fancied" or judged many breeds—bulldogs, Irish terriers, fox-terriers, bull-terriers, collies, etc.

For many weeks he had a standing advertisement in the *Field*—"Wanted, basset hounds;" but the breed was too rare, and failing in his endeavor to found a basset hunt of his own, he purchased a pack of harriers, which are kenneled at his delightful Buckinghamshire residence, Missenden Abbey. Mr. Harding Cox is a good fancier, a good sportsman, and a gentleman unassuming and intelligent.

"Turn about" my pen—Warwick. Irish terriers were a poor show indeed, the only two worth notice being Pretty Lass, who could only get second, and Canteen, by Garryowen—Pretty Lass. The truffle dog class was unable to provoke a single entry.

The foreign dogs were a tremendous sight. It seemed as if all the Zoo had turned out to win prizes. The Esquimaux in particular made a fine show.

The "gate"-seeking committee last year cutely secured Lady Florence Dixie's heroic St. Bernard, Hubert, for the atttraction; this year the community who love dogs but are not "doggy" were treated to a view of another canine celebrity, the railway dog Help. This sagacious creature has collected a good deal of money up and down the lines for the railway servants' fund.

Help is a black collie with white markings. He is by no means up to show form, being coarse in head, with large heavy ears; but his coat is glossy and he has a clever, bright expression.

In reply to the charge that in his capacity as a member of the Kennel Club Committee he attended and took part at a meeting where the conduct of another body was being examined of which he was also a member, Mr. Percy Reid has made the very weak and unsatisfactory reply that though he was present at the meeting which tried the body of which he was a member, he did not assist in the judgment. He left before a decision was come to, he says, and fancies, therefore, that he is exculpated from the charge of bad taste for judicially assisting in the trial that led up to the verdict on the conduct of his colleagues and himself. After reading Mr. Joachim's letter in this week's *Field*, it will be the opinion of most on-lookers, that of the Hertford Committee, the Kennel Club Committee, Mr. Murchison, and Mr. Reid, none will emerge with credit from this affair.

LILLIBULERO.

MAY 6, 1884.

THE ENGLISH FIELD TRIALS.

THE National Field Trials, held at Shrewsbury, Eng., the 23d, 24th and 25th of April, were quite successful, except that, owing to the very dry and dusty condition of the ground, the work of the dogs was not quite so satisfactory as has usually been witnessed at these Trials.

The Pointer Puppy Stakes brought out fifteen starters. We give the entries in the order in which they were drawn to run:

POINTER PUPPY STAKES.

At 5 guineas each; first £45, second £25, third £10.

Mr. C. Thelwell Abbott's liver and white ticked Duke of Wellington (The Fop—Jane), 15mos.,
against
Mr. R. J. Lloyd-Price's liver and white Royal Puck (Royal—Mabel), 13mos.

Mr. Barclay Field's liver and white Rustic (Bow—Peach), 15mos.,
against
Major Platt's liver and white ticked Lady of the Lake (Lake—Flash III.), 13mos.

Major Platt's liver and white ticked Lord of the Isles (Lake—Flash III.) 13mos.,
against
Mr. C. J. Cotes's liver and white Sally Back (Jasper—Sal) 12mos.

Mr. A. P. Heyward-Lonsdale's liver and white Polly (Bow—Peach) 15mos.,
against
Prince Albert Solms's liver and white Luck of Hessen (Naso II.—La Vole) 9mos.

Mr. C. H. Beck's lemon and white Lingo (Bang Bang—Polly) 13mos.,
against
Mr. A. P. Heyward-Lonsdale's Jest (Jasper—Spangle) 13mos.

Mr. C. J. Cotes's liver and white Carlo (Jasper—Sal) 12mos.,
against
Mr. T. Statter's liver and white Pilot (Pax—Poll) 13mos.

Mr. R. J. Lloyd-Price's liver and white Owen Alaw (Lucky Sixpence—Co diad yr Hedydd) 11mos.,
against
Mr. H. A. Adderley's black Chloe (Sambo—Duchess), 12mos.

Mr. C. J. Cotes's lemon and white Jenny Jones (Young Dick—Di Vernon), 8mos., *a bye.*

The stake was finished Thursday morning, with the following result:
Lingo, first.
Carlo, second.
Polly, third.

SETTER PUPPY STAKES.

At £5 5s. each; first £40 and £10 added money, second £25, third £15, fourth £10.

Mr. Thomas Statter's lemon and white Ella (Coningsby—Eve), 14mos.,
against
Mr. T. Dicken's black, white and tan Frank (Brave Baron—Blue Bell), 11mos.

Mr. J. Bishop's black, white and tan Bouncing Queen (Buxton—Bonny Queen), 14mos.,
against
Prince Albert Solms's black and white Tempest (Blue Boy—Countess Kate), 10mos.

Prince Albert Solms's black and white Bandit of Braunfels (Roderick of Braunfels—May Queen), 15mos.,
against
Mr. T. Statter's black, white and tan Grist (Esqr.—Doll), 14mos.

Mr. T. Dicken's black, white and tan Satin (Bruce—Bess), 12mos.,
against
Mr. G. Shaw's black, white and tan Rose (Diamond—Minnie), 12mos.

Mr. E. Bishop's black, white and tan Ranging Moses (Blue Boy—Princess Maud),
against
Mr. E. Armstrong's lemon and white Bess IV. (King Ned—Slut II.).

Col. Cotes's black and white Wild Daisy II. (Sir Alister—Wild Daisy), 12mos.,
against
Mr. E. Bishop's black, white and tan Ranging Samuel (Sam III.—Maud).

Mr. H. Burra's lemon and white May Flower (Bend Or—Jewel) 15mos.,
against
Mr. C. J. Cotes's black, white and tan Daphne (Sir Alister—Wild Daisy) 12mos.

Mr. R. G. Mawson's black, white and tan Dinah (Ranger—Judy) 15mos.,
against
Mr. H. C. Hartley's black, white and tan Pilot (Tam O'Shanter—Gipsy Girl) 15mos.

Mr. P. Power's red Field Marshall (Count—Tilly) 14mos.,
against
Mr. E. Bishop's black, white and tan Ranging Aaron (Blue Boy—Princess Maud).

Mr. C. J. Cotes's black and white Duchess of Wales (Dick II.— ——) *a bye.*

Following is the result:
Rose, first.
Ranging Aaron, second.
Bouncing Queen, third.
Ranging Moses, fourth.

The final heat betwcen the winning pointer and the winning setter was decided in favor of the setter Rose, whose sire won first in the setter stake at Shrewsbury in 1877.

CLOVERLEY STAKES.

Braces, pointers and setters, all ages, £10. 10s. each; pointers, first prize £30; setters, first prize £30; the second best brace of either breed £20; absolute winning brace £10 added.

There were eleven entries for the brace stakes—seven pointers and four setters:

Mr. Barclay Field's liver and white Young Dick (Dick—Flame), 3yrs., and liver and white Young Di (Drake—Puss), 1yr. 10mos.—pointers.

Col. Cotes's lemon and white Duke Wind 'em (Count Wind 'em—Countess Moll), 2yrs., and black, white and tan Dashing Rose (Dash II.—Countess Rose), 2yrs.—setters.

Mr. A. P. Haywood-Lonsdale's liver and white Cassandra (Birr—Fan), 4yrs., and liver and white Polly (Bow—Peach), 1yr. 3mos.—pointers.

Col. Cotes's lemon and white Carlo (Jasper—Sal), 1yr., and lemon and white Jenny Jones (Young Dick—Di Vernon), 8mos.—pointers.

Mr. Daintry Hollins's blue and white Ragman (Rogue—Silk II.), 2yrs., and liver and white Boscobel (Rogue—Silk II.), 2yrs.—setters.

Mr. C. Thelwell Abbott's liver and white The Fop (Faust—Belle), 5yrs., and Brave Bijou (The Fop—Bonny Lanul), 2yrs.—pointers.

Mr. A. P. Heyward-Lonsdale's black and white Mar (Baron—Mailu), 2yrs., and black, white and tan Maggie (Baron—Mailu), 2yrs.—setters.

Prince Albert Solms's liver and white Naso of Kippen (Naso II.—Maggie), 2yrs., and lemon and white Bijou (Priam—Blarney), 2yrs.—pointers.

Mr. Arkwright's black, white and tan Little Bess (Blue Boy—Maud), 2yrs., and black, white and tan Ranger's Ghost (Ranger—Cora), 3yrs.—setters.

Mr. E. Armstrong's liver and white Lincoln (Bob—Jane), 3yrs., and liver and white Garfield (Bob—Jane), 3yrs.—pointers.

Mr. R. J. Lloyd-Price's liver and white Fatima (Bang—Hebe), 4yrs., and liver and white Elias (Bang—Hebe), 4yrs.—pointers.

Following is the result:
Cassandra and Polly, first prize in pointers and first in stake.
Little Bess and Ranger's Ghost, first in setters.
The Fop and Brave Bijou (pointers) prize for second best of either breed.

The Kennel Club Field Trials.

THESE trials were held near Stratford-on-Avon. There were twenty-six starters out of the 159 entries for the Derby, fourteen pointers and twelve setters, as follows:

TENTH FIELD TRIAL DERBY.

For pointer and setter puppies, bred in 1883; £50 for the best pointer, £50 for the best setter, £20 for the second best of each breed, and £50 extra for the absolute winner; 159 subs.

POINTERS.

Mr. C. T. Abbott's liver and white dog Duke of Wellington (The Fop—Jane) Jan. 28,
against
Mr. C. H. Beck's lemon and white bitch Lingo (Bang Bang—Polly) March 30.

Rev. W. J. Richardson's liver and white bitch Milton Rita (Young Bang—Nina) March 2,
against
Mr. Barclay Field's liver and white bitch Rustic (Bow—Peach) Jan. 8.

Major Pratt's liver and white dog Lord of the Isles (Lake—Flash III.), March 31, *a bye*, (owing to error in entry of competitor).

Mr. J. H. Salter's white and black bitch Paris (Priam—Hops), June 30,
against
Col. C. J. Cotes's liver and white Carlo (Jasper—Sal), April 14.

Major Pratt's liver and white bitch Lady of the Lake (Lake—Flash III.) March 31,
against
Prince Solms's liver and white dog Luck of Hessen (Naso—La Vole), July 31.

Sir T. B. Leonard's liver and white bitch Maud III. (Priam—Nell), May 31,
against
Mr. G. Pilkington's liver and white dog Lymm (Lake—Norah), June 11.

Mr. R. J. Lloyd-Price's liver and white dog Owen Alaw (Lucky Sixpence—Golden Guinea), May 4,
against
Sir T. B. Lennard's liver and white dog Plover (Tory—Crystabel), May 5.

Colonel Stubbs—Yolande whelp. Cocker spaniel dog, whelped March 27, 1884, owned by Mr. W. H. Tuck, Wilkesbarre, Pa.

ANOTHER LEGAL DECISION.—Judge Van Vorst and a jury, in Supreme Court, Circuit, were occupied during the entire session yesterday in settling a dispute as to the ownership of a diminutive Skye terrier. The dog disappeared from Mr. Kane's residence at Newport, R. I., and was found in a New York stable. John Thearl, a coachman, said he had purchased the dog of John Darling, another coachman, who said he had brought it from Newport. The question whether Kane or Thearl owned the dog was to be passed upon in that suit yesterday. Mrs. Kane declared that the dog she saw in Thearl's possession was the pet she had lost, and, on cross-examination, was positive she could now recognize it among any number of dogs. Then five Skye terriers, apparently exactly alike, were brought into court, and each in turn was taken before her while on the witness stand, from behind the jury box. She quickly answered as to each of the four first produced, "That is not the dog," but instantly the fifth appeared she said, "That is my dog." Experts testified for the defendant that it was impossible to indentify one Skye terrier, after the lapse of two years, from any other Skye terrier: that the dog in controversy was but four years old, as appeared by its teeth, while the age of the dog Mrs. Kane lost would now be nearly five years, and that this was not, therefore, Mrs. Kane's dog. Darling, of whom Thearl bought the dog, could not be produced, as he had a few days ago suddenly left his employment here and gone to Oregon. It was shown that he was in Newport in the summer of 1881. Mr. Simon Sterne claimed on behalf of the defendant that a dog was not property in the sense that a replevin action could be maintained for its recovery. Judge Van Vorst held that this was no longer so in this State, the common-law rule having been abrogated, and charged the jury that the only question to be determined by them was whether the dog was Mrs. Kane's property at the time Thearl claimed to have bought it. It did not matter whether the dog had strayed or been stolen, and was then sold by the thief or person who took it up. A purchase from such person did not give title as against the owner of the dog. The jury gave a verdict for plaintiff, assessing the value of the dog at $75, and awarding $25 damages in addition.—*N. Y. Sun.*

BOY AND DOG.—James Gessner and his wife called at several police stations yesterday for news of their 14-year old boy Cornelius, who has been missing since May 1. His mother had turned his little black dog out of the house, and Cornelius said he would go with the dog. "I met some boys up town," Mr. Gessner said, "and they told me that they saw him near Twenty-third street and Second avenue last Saturday. He was cuddled up in the doorway of a big building asleep with the dog. They said they tried to get him to come home, but he ran away. Mr. Doherty, my neighbor, saw him upon Second avenue on Monday with the dog. A policeman had a talk with him on Tuesday, and the dog was with him."—*N. Y. Sun.*

ROYALIST.—*Editor Forest and Stream:* Please note in your paper that the Millbrook Kennel's smooth-coated St. Bernard dog Royalist, second prize at the New York show, had only arrived from England the Friday previous, after a fourteen days' passage. He was seasick all the time, and did not eat more than five meals on the voyage. His weight when in good form is 170 pounds. He lost some 35 pounds coming over. He is very big-boned and massive, and will not be "lanky" in a month from now.—W. W. TUCKER (New York, May 15).

THE CHICAGO DOG SHOW.—The second annual bench show to be held at Chicago June 10, 11, 12 and 14 promises to be the largest show ever held in the West. There will be extra champion classes for setters, pointers and spaniels. The show will be held in the armory of Battery D, the same building that was used last year. Entries close May 31. Premium lists may be had by addressing Mr. Charles Lincoln, Box 384, Chicago, Ill.

SPANIEL IMPORTATION.—Mr. Andrew Laidlaw, Woodstock, Ontario, has received the liver and tan cocker spaniel bitch Newton-Abbot Lady from Jacobs's Kennel, Devonshire, England. She is by Bend Or, a noted prize winner, out of the celebrated Ladybird, and should be an acquisition to the spaniel stock of the country. She was bred to Farrow's Obo before being shipped.

FASTEST GREYHOUND PRIZE.—Mr. J. McMaster's Scotty won the special for the fastest greyhound at the New York show. We were unable to obtain the information in season to publish last week.

SPECIAL SENSATION PUPPY PRIZE.—The winner of this prize at the New York show was Mr. F. R. Hitchcock's Prince Hamlet (Sensation—Lass).

BLACK VICTOR.—*Editor Forest and Stream:* Can you or any of your readers give me the pedigree of the cocker spaniel Black Victor?—K.

PUBLISHER'S DEPARTMENT.

The small boy in front of the organ grinder is no more inevitable than that the pen in the penholder you are using should be Esterbrook's.—*Adv.*

The Clinton Manufacturing Co., 32 Vesey street, New York, offer a gold watch to the person sending them the largest number of English dictionary words contained in "Bayberry Glycerine Soap" (proper and geographical names excluded). The list will close on July 4, 1884.—*Adv.*

BOOK OF THE DOG.—We have received from the Philadelphia Kennels, 237 South Eighth street, a copy of their Dog Buyers' Guide. It contains a finely executed colored frontispiece; well drawn engravings of nearly every breed of dog, and all kinds of dog furnishing goods. We should judge that the book cost to produce a great deal more than the price asked—10 cents—and would advise all our readers who are interested in dogs to send for the book.—*Adv.*

Rifle and Tray Shooting.

FIXTURES.

May 20 to 23.—Knoxville Gun Club Second Annual Tournament, Knoxville, Tenn. C. C. Hebbard, Secretary.

May 26 to 31.—First International Clay-Pigeon Tournament, at Chicago, Ill. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

June 2 to 9.—Annual Tournament Louisville Sportsmen's Association, Louisville, Ky. J. O. Barbour, Secretary, 157 Third avenue, Louisville.

RIFLES OF TO-DAY.

THE WINCHESTER REPEATING ARM.

THIS rifle is one of the best known of the many repeating arms which have followed each other into public attention within the past twenty years. It has lived down much opposition, and is a favorite with many expert hunters in every section of the world.

The present form of Winchester gun is to be credited to several different inventors. In 1854 the Messrs. Horace Smith and D. S. Wesson (of the firm of Smith & Wesson, pistol makers) invented the arrangement of finger lever, links and breech bolt now used in the Winchester gun. These they made use of in what was known at that time as the "Volcanic Repeating Pistol." In this form it came into possession of the Volcanic Arms Company, a corporation organized for its manufacture at New Haven, of which Mr. O. F. Winchester was a very large stockholder. This concern failed immediately, the pistol proving to be a very imperfect invention, defective in the form of cartridge which it used, and in other respects, more by reason of the state of the art at that time than through fault in design. The assets of the bankrupt company were purchased by Mr. O. F. Winchester and a new company was organized for the manufacture of the same arm, improved by Mr. B. Tyler Henry, of New Haven, and the new gun was known as the Henry rifle. Mr. Henry's improvement permitted the use of a metallic cartridge, and added to the gun the form of extractor and arrangement of firing pin used in the present gun. The Henry gun was successfully manufactured for several years, during the war and afterward. Several Western regiments were armed with it and it speedily acquired reputation. As the demand increased, the manufacture of the gun, which had been carried on at New Haven, was transferred to Bridgeport, Conn.

The defects which had been found to exist in the Henry gun were remedied chiefly by the improvement of Mr. Nelson King, at that time (1866) in the employ of the company, which had again changed its name and become the Winchester Repeating Arms Co. Mr. King's improvement consisting in the side loading arrangement, which has, since the expiration of his patent, been adopted in all repeating arms which have the magazine under the barrel. As the gun had accumulated many improvements, so that its origin could be attributed to no one individual, it gradually lost its name and acquired to itself the name of the company manufacturing it, becoming known as the Winchester gun. In 1870 its place of manufacture was changed from Bridgeport, Conn., to New Haven, in the same State, where it has since been made. About four hundred thousand of all kinds have been made and sold. It is now offered in many different forms. The model of '66 is a rim-fire gun. The model of '73 and '76 are center-fire guns. The model of '73 is made for 32, .38 and .44 caliber cartridges. A .22-caliber of this model will soon be put upon the market. The model of '76 is made to carry two different cartridges of .45-caliber, one of 75 grains and one of 60 grains, and a .50-caliber cartridge of 95 grams of powder.

The Winchester gun is universally used, the foreign demand being about as large as the domestic. About one hundred thousand guns are in the hands of the Turkish army, and the celebrated "leaden rain" at Plevna came from them. About twenty-five thousand are in the hands of the Chilian troops and were used against the Peruvians in the late war. The Northwestern mounted police are armed in large part with carbines, model '76, which have been bought from time to time in small lots during the last few years.

No attempt has been made to advertise the Winchester gun at targets or upon the different ranges of the country. The sale and reputation of the gun has made this, in the opinion of its makers, entirely unnecessary. The following score of the rapidity and accuracy match at Creedmoor of 1876 shows what the Winchester has accomplished on the national range.

The match was for the Schuyler, Hartley & Graham medal, which, according to the conditions, was open to all comers. Distance 200yds. Position, standing. Any rifle. Magazine guns to be used as single-loaders only. Two sighting shots, to be fired consecutively. Competitors may fire as many shots as possible within half a minute, and to have two chances; the aggregate score made in both rounds to be counted. Entrance fee, 50 cents; half the entrance money to be divided among the three highest scores, as follows: The first taking the badge and half the money, the second two-sixths, and the third one-sixth. No restriction as to the manner of taking cartridges. Badge to be won three times (not necessarily consecutively), before becoming the personal property of the winner. Competitors will stand at firing point with rifle loaded and cocked, butt below elbow, until the command "Fire." The scorer will command: "Are you ready? Fire!" and invert a half-minute sand glass; at the end of thirty seconds he will call "Time." A bullseye will be deducted from the score for every shot fired after "time" is called.

WINNERS.

Date—1876.	Number of Competitors.	Name.	Rifle.	Score.
1—July 22.....	19	Wm. Robertson....	W.-B.	37
2—August 19.....	6	Geo. W. Wingate...	Spr.	34
3—September 16...	10	J. E. Stetson.....	Win.	52
4—October 21.....	5	J. E. Stetson	Win.	73
5—November 18....	6	J. E. Stetson.....	Win.	63

Finally won by Capt. J. E. Stetson, who entered only on the last three days, using a Winchester rifle as a single breechloader only, in competition with Ward-Burton, Remington, Springfield, Sharps and Peabody rifles.

The cuts show the general features of the arm in Fig. 1, while in Figs. 2 and 3 may be seen the interior workings of the breech mechanism.

The magazine is charged while the system is closed, in the position shown in Fig. 2, by pressing down the spring cover, found on the right hand side of the receiver, with the point of the cartridge, and inserting the latter through the opening thus made. This last is closed by the spring cover as soon as the cartridge is inserted. The operation is repeated until the magazine is filled.

When it is desired to load, the finger-lever, B, is thrown forward to the position shown in Fig. 3, and then returned to that shown in Fig. 2. This motion throws out the shell or cartridge in the chamber, transfers a cartridge from the magazine to the chamber, cocks the hammer, and leaves the arm ready to fire by pulling the trigger.

This motion may be executed while the gun is at the hip or at the shoulder, without taking the eye from the sights, thus enabling the firer to discharge two or more shots without removing the gun from the shoulder or losing sight of the object which it is desired to hit.

The model of 1866, now regarded in many quarters as little better than a pop gun, was first introduced in 1866 to supercede the Henry rifle, which had from 1860 been manufactured by the New Haven Arms Company, which was succeeded in 1866 by the Winchester Repeating Arms Company. It remains, in the mechanism for loading and firing, precisely the same as the Henry, the improvements consists in an entire change in the magazine, and the arrangement for filling it. This gun uses a rim-fire metallic cartridge, .44-caliber, with 28 grains of powder and 200 grains of lead. The receiver, or lock frame is of gun metal; the other parts, except the stock, of steel and wrought iron, of the best quality; no malleable iron being used. Up to the limit of range that is possible with the small amount of powder and ball used, it to-day remains unexcelled as a weapon or hunting piece; and, contrary to the expectation of the manufacturers since the introduction of more powerful arms, it is still in active demand in many markets, and about 160,000 are now in use.

In the model of 1873, the first and most important improvement consists in adapting it to the use of a longer and center-fire cartridge, holding a charge of 40 grains of powder instead of 28 as in the model of 1866, retaining the same caliber, .44, and the same weight of ball, viz., 200 grains. The effect of this change is to increase the initial velocity of the arm from about 1,125 to 1,325 feet per second, reducing or flattening the trajectory, and increasing the power and accuracy of the arm, and giving it a penetration of about four inches in pine board at 1,000yds. The cartridges can also be reloaded. A second improvement in the sporting arm is the addition of a set, or hair-trigger. This differs from the ordinary hair trigger, in that it can be used precisely as if this trigger were not on the gun, if, as in hunting, it is not wanted. For fine shooting, as in target practice; it is made available, thus: After setting the hammer at full cock, the trigger should be pressed forward slightly, and it is thus set. If it is found too delicate, or not delicate enough, it can be adjusted to suit the wishes by turning a set screw in or out. This screw will be found by the side of the trigger.

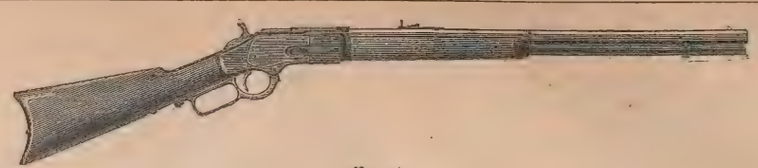

FIG. 1.

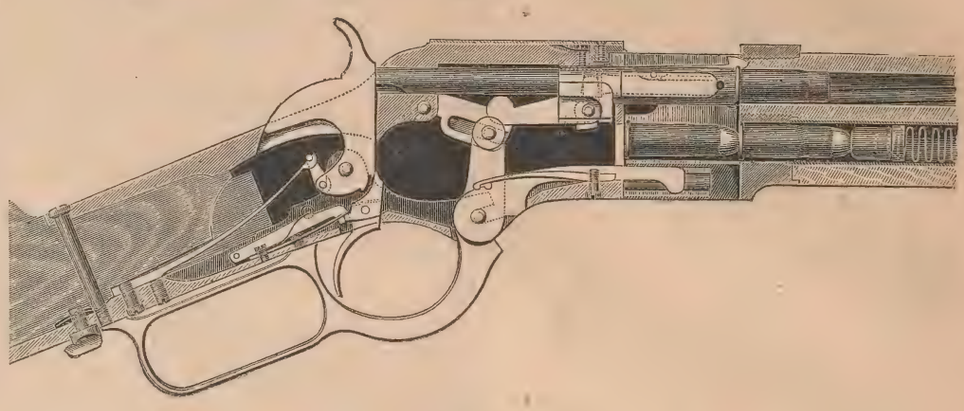

FIG. 2.

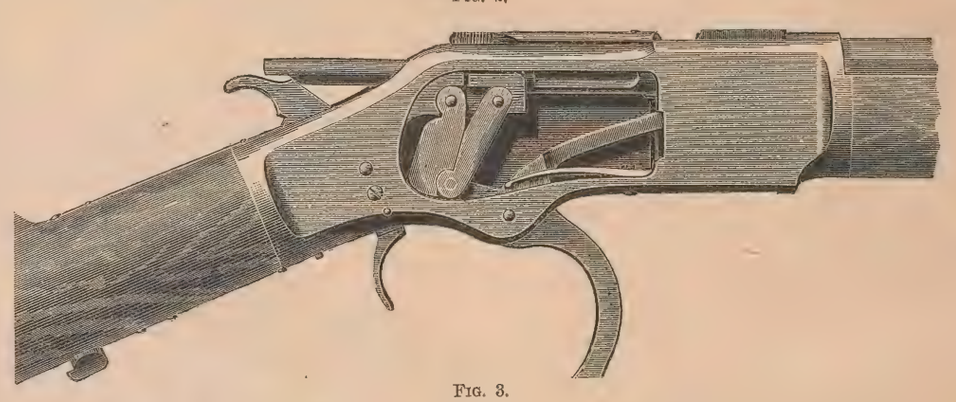

FIG. 3.

A third improvement consists in a sliding lid, which covers the opening in which the carrier block moves up and down. This lid, by the action of the finger lever, opens automatically when the gun is loaded, and should always remain open until closed by hand after firing. The object of this lid is to keep dirt and snow out of the lock.

A fourth improvement consists in the substitution of iron, in place of gun-metal or brass, in the manufacture of the lock-frame, butt plate, and other parts, thus increasing the strength of the arm and reducing its weight. The gun-metal is, however, retained in the carrier-block and the lid in the butt-plate, opening into the receptacle for the cleaning-rod, the object being to avoid the liability to rust, so as to impede the movement of these parts, which would exist if made of iron.

A fifth improvement consists in a device which, it is, claimed, absolutely prevents accidental or premature explosions. In most breech-loading firearms the firing pin, after the explosion of a cartridge, depends upon a spiral spring to be thrown back even with the face of the breechclosing bolt. If this spring is very strong, so as to insure its operation, it tends to break the force of the blow of the hammer; but if not strong enough for the purpose, it soon gets so foul as not to work; and the firing-pin then projects, and if the breech is closed with a quick motion, the cartridge is exploded prematurely. To obviate this, no spring is used; but the firing-pin is carried back by a positive motion retractor.

There is made also of this model a .38-cal. to meet the demand for a small-bore repeater. It employs a bottle-neck shell holding 40grs. powder and 180 of lead, and is accurate up to 300yds., and for glass ball shooters is a convenient arm. To meet a demand for a repeater of still smaller caliber, the .32-cal. arm was made, also carrying a center-fire cartridge, having 20grs of powder behind 115 of lead. Like the preceding arm, it is made with full and half length magazine.

The success attending the sale and use of model 1873, and the constant calls from many sources, and particularly from the regions in which the grizzly bear and other large game are found, as well as from the plains where the absence of cover and the shyness of the game require the hunter to make his shots at long range, made it desirable for the company to build a still more powerful gun, and the model of 1876 was introduced.

Retaining all essential mechanical elements of the former model, and adding such improvements as seemed possible, the result has been a gun carrying a central-fire cartridge, capable of reloading, caliber .45 with 75 grains of powder and 350 grains of lead, being nearly double the charge used in model 1873, and giving an initial velocity of 1,450 feet. The materials used in the construction of the gun are the same in kind and quality as the model 1873. Both set and plain trigger rifles are made; and all guns with plain trigger are provided with an attachment which renders premature explosion of the cartridge, even from carelessness, absolutely impossible. In both infantry musket and carbine, the magazine is covered by the forearm its entire length. Sporting rifles may be had with pistol grip stocks, vernier and wind gauge sights, if ordered.

The .45-60-300 form of the model of 1873 has been put on the market to meet the wants of those who desire an arm using a lighter charge than 75 grains of powder and 350 grains of lead, which is the amount used in the regular model 1876. It is the same in every particular as that arm, and differs only from it in that it is chambered to use a .45-caliber straight shell, with 60 grains of powder and 300 grains of lead.

The express rifle is a modification of the model 1876, and differs from it only in caliber, .50, and in the cartridge to which it is adapted. This last contains 95 grains of powder, and a hollow-pointed bullet weighing 300 grains. The bullet contains no explosive material. The inserted copper tube is simply put in to stiffen the bullet. It contains no powder or explosive of any kind.

Cartridges for this model are loaded with hollow-pointed, solid, or split-pointed bullets, as may be desired. All these bullets weigh 300 grains each, and their shooting qualities are about equal.

The bullet having a high initial velocity, a very flat trajectory is obtained; and no change in sighting is required up to 150yds., thus enabling the hunter to avoid missing the game through error in calculating distances, while the recoil is not much greater than that of a 12-gauge shotgun using ordinary charges. This model, as made up for the English market with a 22in. barrel and with full length magazine, weighs but 8¼ pounds.

The rifle is considered an easy one to keep in good repair. After using the rifle, before putting it away, it should always be well cleaned and oiled, inside and out; for this purpose a cleaning-rod will be found in the stock of the rifle, and is got out by opening a lid in the butt-plate.

To take out the barrel.—Take out the two tip-screws, the magazine ring-pin, pull out the magazine tube, and take off the fore-arm; then, before unscrewing the barrel from the frame, the breech-pin must be thrown back by moving the finger-lever forward; otherwise the attempt to unscrew it will break the spring-catch that withdraws the cartridge, and ruin the breech-pin. The only spring in the gun that is liable to lose its strength from long use is the main-spring, which will be discovered by the gun missing fire. Should this occur, it may be strengthened by turning up the strain screw, which will be found directly under it, on the under side of the frame.

To remove the breech-pin in the model of 1866.—After removing the side plates and links the spring-catch must next be taken out, which is done by moving the breech-pin back so that the pin that holds the spring-catch will be in a line with a corresponding hole through the frame; then with a small steel wire punch out the pin, then move the breech-pin forward and take out the spring-catch; the piston can then be unscrewed from the breech with plyers or hand vise, first setting the hammer at full cock, or taking it out.

To remove the breech-pin in the models of 1873 and 1876.—After removing the side plates and links, take out the link-pin and retractor; the piston can then be pulled out with the fingers, first removing the hammer or setting it at full cock.

The price list of the Winchester arms varies with the different models, and care should be taken in ordering to specify the model as well as the caliber if any special form of arm is desired. The 1867 model sporting rifle costs $22 with 24in. round barrel, carrying 15 shots and weighing 9 pounds. Octagon barrels cost $1 more. Muskets for the same cost $22, and carbines $20. The 1873 model sporting rifle carries 15 shots, .44-cal., and costs from $25 to $27 according to the barrel. Muskets and carbines cost respectively $26 and $24. This model is chambered for the .44-40-200 cartridge, for the .38-40-180 and for the .32-20-115 cartridge. The model of 1876 is a much heavier rifle, and costs from $27 to $29, having a 12 shot magazine and a 28in. barrel. The musket with a 32in. barrel costs $27, and the carbine 22in. long in the barrel costs $25.

The weapons of this class call for a .45-cal. bullet and the cartridge made for it is a .45-75-350. The largest rifle of the company is the express of .50-cal. The cost is from $35 to $38 according to shape of barrel, all being 26in. long or under. The target rifle, which belongs to the 1876 model class, costs with pistol grip $45, and with vernier and wind gauge sights in addition $63.

AIR RESISTANCE.

Editor Forest and Stream:

Before answering categorically the article on "Air Resistance," by "P.," contained in your issue of May 1, I wish to call attention to his fifth paragraph, commencing "I take it for granted, etc.

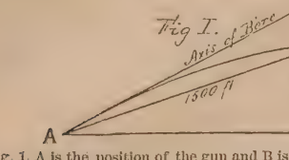
He has made a mistake in taking it for granted. The facts being that I have been a reader of FOREST AND STREAM for but little over a year, and that the article I criticised last fall was the first of his that I had ever seen. Thus the implied charge of plagiarism falls to the ground. A careful perusal of his article and of the authorities quoted (not "P.'s" quotations, for he has selected these to suit his end) will convince any unbiased reader.

First—That in making my criticism I have not fallen into any error or discovered any "mare's nest," but that my conclusions were absolutely correct. Compare my article in FOREST AND STREAM, Aug. 9, with "Motion of Projectiles," also with section four of the article under discussion.

Second—That "P." was wrong in saying that "Taking the element of velocity into account, the air resistance proved from these experiments to be greatest between velocities from 1,100 f.s. to 1,350 f.s."

Third—That he knows that he was wrong. See his fourth paragraph in which he says, "But there has been nothing written by me that in the remotest manner can bear the construction that a ball for instance at 1,000 f.s. has greater resistance in pounds, avoirdupois, than the same ball at 200 f.s., for it is very evident that at the latter velocity the actual resistance in pounds is eight times greater than at the former velocity." In other words the resistance varies as the cube of the velocity. (This is not strictly correct, as the variable coefficient K has been omitted, taking this into account the ratio becomes 1 to 7.34 instead of 1 to 8 as above).

Referring to the above quotation I claim that what was written by him last summer could bear the construction he now wishes to disown and no other. The fact of the resistance being expressed in pounds, avoirdupois, makes no difference whatever. If it had been expressed in kilogrammes or in any other unit the principle involved remains the same. Attention is also called to the fact that his fourth paragraph flatly contradicts his third.



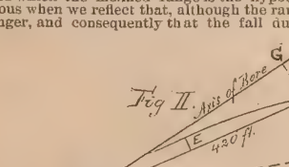
Fourth—That he tries to escape from his position by a quibble utterly unworthy of him, when he attempts to confound "resistance of the air" with the "co-efficient of air resistance"—K.

Now, what is this K to which "P." seeks to give undue prominence? It is simply a variable empirical co-efficient, representing no general law, and is only introduced to effect an agreement between the results of experiments and the so called "cubic law of resistance." The same agreement might have been effected, less conveniently perhaps, by employing a variable exponent of V instead of the cube in place of this variable co-efficient.

The next paragraph that calls for an answer is the one in which he calls my attention to another error. My statement that the trajectory would be 2in. higher (theoretically) than for a level range, was inferred from a calculation contained in the report of Chief of Ord-

nance, 1882, pp. 455-456, where it is deduced that a Springfield rifle being fired at a range of 500yds. with the normal elevation, but at an object 100ft. higher than the gun, the bullet will strike 2 87ft. below the point aimed at. I did not check this calculation, but took it on trust. This, I am willing to admit, was a wrong course to pursue, as we should never accept as true any proposition that we can verify for ourselves.

The following considerations would seem to show that the calculation above referred to is wrong:

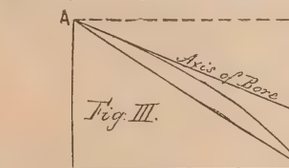


In Fig. 1, A is the position of the gun and B is the point aimed at. The normal angle of elevation for a level range of 50 yds. or 1,500ft. is given at 1° 11′. Thus the fall in feet due to gravity is evidently equal to 1,500 × tan. 1° 11′, or 30.984ft.

In the case under consideration the axis of the bore makes an angle of 5° 00′ 2″ with the horizontal, and if gravity did not act the bullet would strike at D, at an elevation above C=A C×tan. 5° 00′ 21″= 131.095ft. But we have already seen that under the influence of gravity the bullet will fall 30.984ft. Thus it will strike the vertical line C D at a point above C=131 09 −30.984 or 100.111ft. or 0 111ft above B instead of 2.87ft. below it, as given in the text. That it strikes above is due to the fact that A C is some 4ft short of the assumed 500yd. range and also that the angle of elevation probably is slightly greater than 1° 11′. In stating that the trajectory would be higher, I referred to the point B and not C, as "P." seems to suppose. See his sketch.

Though 2″ is considerably in excess of the truth, yet the curve will always be higher at mid range than for a level range, as will be shown further on, and my error was one of amount rather than of principle.

Figs. 2 and 3 embody the substance of "P.'s" remarks on mountain shooting.



It will be seen that he is practically correct in stating that the angle of elevation in either case is the same as that corresponding to a level range of which the inclined range is the hypothenuse. The reason is obvious when we reflect that, although the range and time of flight are longer, and consequently that the fall due to gravity (B D) is

C B = 293.937ft. TRAJ. = 293.934ft.

greater, only the component of this force, G B (Fig 2), acting at right angles to the axis of the bore, produces deflection.

The other component of gravity acting in the direction of the axis

C B = 293.937ft. TRAJ. = 293.932ft.

produces either retardation (Fig. 2) or acceleration (Fig. 3), according as it acts in opposition to the motion or with it. In Fig. 2 let

R = the inclined range A B.
r = the corresponding horizontal range A C.
H = space described by gravity corresponding to R or B D.
h = space described by gravity corresponding to r or K C.
A = angle made by inclined range with the horizontal.
B = angle of elevation.

Then the deviating component of gravity G B = H×cos (A+B) and r = R×cos A.

From these relations and the equation to the trajectory, it may be proved that the triangle G A B is similar to K A C, or, in other words, that the angle of elevation for the inclined range is equal to that for the corresponding level range.

This is only approximately correct, as it is based on the supposition that cos (A+B)=cos A cos B. This will obtain very nearly when A is large and B is small, or when B is large and A is small, or when both A and B are small. If A and B are both large the above will not apply. This reasoning is equally applicable to the depressed range Fig. 3, except that the difference of the angles A and B must be employed instead of their sum.

The trajectories shown in the figures are calculated for a .40-cal. gun, shooting a 287-grain bullet with an initial velocity of 1,425 f.s.

At the elevated range the bullet strikes .038in. below the point aimed at, and at the depressed range .06in. above it. This is due to the retarding and accelerating components of gravity mentioned above. Another point of interest is that, though the bullet strikes very near the point aimed at, it will make a much higher curve in getting there than for a level range.

Thus in Fig. 2, the height E at mid range, measured at right angles to the range is 3.792 inches, while the height F for the level range is only 2.688 inches or 1.104 inches lower If the range were extended to 200 yards, the difference would be about 5 inches. At mid range though, the bullet would still strike within a fraction of an inch of the place aimed at. These results are of general application and are nearly true for any angle and range, provided that a practical equality exists between the cosine of the sum of the angles and the product of their cosines. (If the range is depressed, the difference of the angles is to be taken. See Fig. 3).

I have gone into this subject of inclined ranges at considerable length as the question is one of considerable importance, and one that I believe is not very generally understood. The algebraic computations have been omitted, as they were hardly within the scope of this article. Any one, however, who wishes to check them, may do so by referring to works on the subject. "Rational and Practical Ballistics," Captain Siacci, seems as satisfactory as any.

As to Maj. Merrill's argument that the muzzloader would give a flatter trajectory than the breechloader. He stated his case clearly enough, and I do not think that his position has been misunderstood as might be inferred from what "P." says on the subject. The Major said in substance: First—That the muzzleloader would take more and quicker powder for equal bores. Second—It would take a lighter bullet and the lightest of any for equal bores. To which I replied that the breechloader will take as much powder as can be consumed in the length of the barrel and as quick powder as is desirable having the best results in view. Since writing the above the breechloader has been adapted to greatly increased charges and the only practical limit is that of the endurance of the man behind the gun. As to the bullet, the breechloader will shoot acurately the lightest bullet conforming to the flattest trajectory at 200yds., the range under discussion, and there is no practical reason why it should not shoot a lighter one if it were desirable. That a heavier bullet has been generally adopted is due to the fact that we are not willing to sacrifice accuracy and energy to a flat trajectory. See what has been written by myself and others on this point.

The comparative merits of the two systems as to accuracy may be considered as settled. But there is one point of superiority in the breechloader that has been barely touched on in your columns. Capt. Mackinlay's "Text Book of Gunnery" states this so clearly that I need hardly apologize for quoting from him here. After showing, from Capt. Noble, the great difference in energy imparted to a projectile by varying ratios of expansion, obtained by dividing the volume of the bore by the space occupied by the powder charge, he says: "The rifled muzzleloading guns which replaced them [the early form of R. B. L.] were less accurate, chiefly because some gunners ram home with more force than others, and, as the cartridge is slightly compressible, different charges occupied different spaces, according to the strength of the gunner who happened to be ramming home; the velocities of the projectiles, and consequently the ranges, varied, and the accuracy was impaired."

That this cause of inaccuracy is liable to occur in all muzzleloaders seems to me self-evident, and it is equally evident that it need never occur in a breechloader with ordinary care. JAMES DUANE.

NEW YORK, May 11, 1884.

RANGE AND GALLERY.

"FRELINGHUYSENS AT NEW YORK."—*Editor Forest and Stream:* Under the head of the "Frelinghuysen's at New York," your issue of the 15th inst. contains a communication from Edward O. Chase, taking exception to the manner of keeping the scores in the late tournament at the Grand Central Rifle Gallery. That some errors should necessarily occur in a match when there were some fifteen hundred targets shot could hardly be avoided. In this class must be considered the omitting from the score record the names of Messrs. Neil and Sneller, whose targets were inadvertently tied together by the attendants and put among the inspected targets without in any way coming under the notice of the umpires. In the case of Mr. Weigman the communication is positively unjust. This gentleman's score got out originally through an oversight. The number of shots on the targets were not counted, and on a revision it was found that only six could be found. The targets were submitted to several riflemen thoroughly conversant with gallery shooting, namely, Henry Oehl, P. G. Fanning, Chas. Overbaugh, etc., and by all pronounced not to have the requisite number of shots, and as a consequence were rejected. That there was no "connivance" in the award is sufficiently apparent when it is considered that placing the name of Mr. Weigman as a prize winner would only result in dropping that of Mr. Sneller, also a Newark rifleman. From the committee of the N. Y. Rifle Club.—J. H. BROWN, Capt.

"W. M. F." IS NOT FARROW.—Grand Haven, Mich., May 3, 1884. —*Editor Forest and Stream:* Mr. Duane probably thinks as scores of others do, that I am the author of contributions appearing in FOREST AND STREAM signed W. M. F., on rifle matters. Would it be asking too much to let him know to the contrary?—W. MILTON FARROW.

MANCHESTER, N. H., May 13.—Regular shoot of the Manchester Rifle Association, Creedmoor practice match:

J Barnett	26	29	29—84
M Wadleigh	26	20	—55
E Partridge	25	26	—51
C Norman	20	25	—45

A S Brown	28		—28

The annual meeting will be held May 28–30.

BOSTON, May 17.—Not a first-class day for rifle shooting, but still the gentlemen at Walnut Hill had quite a pleasant time. Carrying out the innovation of last week, a team match was shot. This was a close fight, and resulted in a victory for Mr. Charles's team by one point. Following is the result of the team match:

W. Charles' Team.		J. B. Fellows' Team.	
W. Charles	4 4 5 5 5 5 5—43	L. F. Richardson	5 4 5 5 5 4 5—33
W. Fisher	5 4 4 5 5 5 5—32	C. B. Edwards	4 4 4 5 5 5 4—31
E. Adams	4 5 4 4 4 5 3—29	J. B. Fellows	5 4 5 4 5 4 4—31
W. C. Eddy	4 4 5 4 3 4 4—28	P. B. Smith	3 4 3 5 4 4 3—26
	122		121

In addition to the team match, the regular matches were on, and filled quite well. Following are the scores:

Creedmoor Practice Match.		Creedmoor Prize Match.	
C B Edwards	5555555454—48	E F Richardson	4555555455—48
J E Darmoddy	4445544354—42	B D Curtis	5555545543—46

THOMASTON, Conn., May 19.—At the shoot of the Empire Rifle Club on Saturday last, E. Bennett won the badge with a score of 105 out of a possible 120. Following are the other scores: W. Dunbar 104, G. Canfield 98, A. Fox 94, C. F. Williams 92, F. Carr 85, G. Lemmon 85, G. Gilbert 83, C. Alling 77.

MANCHESTER, Mass.—Following is the programme for the spring meeting of the Manchester Rifle Association for May 28, 29 and 30: 200yds. match, Creedmoor target, open to all comers; position, standing; rifle, any within the rules; rounds, 7; entries unlimited; entry fee, $1: re-entries, 25 cents each. Winners decided by the aggregate of the best three scores counted as one continuous score.

BOSTON, Mass.—The directors of the Massachusetts Rifle Association, have decided on May 29, 30, and 31, for the spring meeting at Walnut Hill, and have issued the following programme:

First—200yd. match, Creedmoor target, open to all comers, distance 200yds.; position, standing; rifle, any within the rules; rounds, seven; entries, unlimited; entry fee, $1; re-entries, 50 cents each. Winners to be decided by the aggregate of the three best scores counted as one continuous score, the winners to select prizes in order of their scores.

Second—200yd. match, decimal target; conditions same as in match No. 1.

Third—600yd. carton match; conditions as in match 1, except as to position, which may be any within the rules.

Liberal prizes are offered in each match.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

CHICAGO TOURNAMENT.

THE first international clay pigeon tournament will begin at Chicago next Monday, May 26. For list of entered clubs see last issue. The Chicago Musical Festival will be held on same date, and local excursion tickets will be sold on railroads. The address of the manager, Mr. J. E. Bloom, is Palmer House, Chicago.

CAPTAIN STUBBS, who is pretty confident that he can whip all creation with the shotgun, is out with the following challenges, preparatory to his exhibition tour through the country:

"Challenge No. 1—I will shoot a match against any man (Dr. W. F. Carver preferred), from standing positions and from horseback in full run, with shotgun, rifle and pistol, at still and flying objects, in any match or consecutive number of matches, and under any equal terms and conditions that may be named, for the championship title and $2,500 to $5,000 a side and gate money. (Signed) CAPTAIN E. E. STUBBS, Champion Endurance Shot of the World (Gainesville, Ark., May 15, 1884). Challenge No. 2—As a test of endurance and skill, I will shoot a match against any man (Dr. W. F. Carver preferred) with rifle and solid bullets, and with shotgun, at 1,000 composition or clay balls each, thrown in the air by two assistants standing 10 feet apart, for the championship title and $2,500 to $5,000 a side, the contestant making shortest time and greatest number of hits to be declared the winner of stakes and owner of gate money. (Signed) CAPTAIN E. E. STUBBS, Champion Endurance Shot of the World (Gainesville, Ark., May 15, 1884). Terms and conditions—Notified of the acceptance of either of the above challenges, or both of them, I will deposit within ten days from date of such notification, with the *Spirit of the Times*, $1,000 as forfeit money (the party accepting to do likewise)—the stake or challenge money to be deposited in the same hands ten days before the date fixed for the match or matches (the party failing to comply with this condition to forfeit the deposit already mad), said match or matches to be shot in New York within six months from date, in fine weather only, and according to the rules governing such contests. (Signed) CAPTAIN E. E. STUBBS, Champion Combination Wing Shot of the World (Gainesville, Ark., May 15, 1884)."

NEW HAVEN, May 14.—The State clay-pigeon medal, which was held by the New Haven Gun Club, and the individual State medal, held by J. F. Ives, were shot for on the grounds of the New Haven Club to-day. The day was fine with the exception of a strong wind, which made the shooting difficult and reduced the scores of the different clubs. Before the match a sweepstake was shoot, with 35 entries, which resulted in Langdon, of the New Haven Club, and J. F. Ives, of the Parker Gun Club, dividing first, Talcot took second, E. A. Folsom third, and E. Boon fourth. Eleven teams from the different clubs shot for the State medal, with the following result, 4 men each team, 100 pigeons: New Haven 61, Meriden 66, Winsted 58, Winsted No. 2, 53, Derby 53, Bridgeport 51, Wallingford 56, Milford 51, Milford No. 2, 47, New Haven No. 2, 57, Meriden No. 2, 41. Over 30 men shot for the individual State medal, at 50 pigeons, and it was won by Tousey, of Bridgeport, with a score of 47; J. F. Ives, 40; the others withdrew. Next State shoot in Meriden, June 11.

MINNEAPOLIS GUN CLUB.—At their annual meeting held Monday, April 21, the following officers were elected: L. Harrison, President; Frank Gruglas, Vice-President; Chas. A. Russell, Secretary and Treasurer. Board of Directors: L. Harrison, F. W. Caulkins, James Marshall.—L. H.

ACME ROD AND GUN CLUB, of Brooklyn, N. Y., Dexter's Park, Cypress Hills, L. I., Tuesday, May 13. Glass balls, revolving trap, for a gold badge.

PITTSBURGH, May 13.—The annual shoot of the Allegheny Sportsmen's Association was held at Idlewood, on the Panhandle Railroad, to-day. The weather was good, and notwithstanding a strong wind was blowing from the west, some remarkable shooting was done. Twelve members of the club took part in the pigeon match for the Hague silver cup and the prize offered by the club. The conditions were 26yds. rise, plunge traps, 5yds. apart and 80yds. boundary, both barrels. Mr. Heilwig was chosen referee, and Messrs. Grogan and Sharp judges. The match was very exciting. Many excellent shots were made, several birds being killed at 70yds.

Mr. C. G. Donnell made a clean score, killing 15 birds in 21 shots. Messrs. G. E. Painter and R. S. Hartrick made a score of 14, one bird of the former dropping dead ten feet out of bounds. C. G. Donnell 15, G. E. Painter 14, R. S. D. Hartrick 14, C. B. Lovatt 13, W. H. Bown S. S. D. Thompson 11, C. M. Hostetter 11, John Lovatt 13, C. H. Voigt, M. D. 10, W. S. Bell 8, E. Gregg 9.

MONTGOMERY, Ala., May 14.—The Montgomery Shooting Club's annual election and dinner at Jackson's Lake to-day was a recherche affair and largely attended. They elected Col. W. S. Reese, President; John L. Cobb, Vice-President; Henry C. Davidson, Secretary and Treasurer; C. E. Wallin, H. D. Long and W. S. Hutchins, Directors. Their model secretary was presented by the club in very appropriate remarks with a handsomely engraved mammoth silver pitcher, inscribed "Montgomery Shooting Club to Henry C. Davidson, May 14, 1884."

WASHINGTON, D. C., May 14.—The two concluding matches for positions on the team which will represent the Capital City Gun Club in the international tournament at Chicago, commencing May 26, were shot yesterday afternoon. Conditions: Ten double and ten single clay-pigeons per man, from five traps, set three yards apart, 15yds. rise for double and 18yds for single birds.

First Match.

Mills	11	11	11	11	1111111111—20
Wagner	11	11	11	10	01 1101111111—17
Smith	10	01	11	11	11 0010101111—14
Bailey	01	00	01	11	11 1101101011—13
McKelden	10	00	11	10	01 1111110011—13
McLeod	01	10	11	10	10 1110001111—13
Jones	00	11	11	10	10 0110101111—13
Magruder	11	00	11	10	10 1010001001—11
Laird	00	10	00	01	11 1010111001—10

Second Match.

Mills	11	10	11	11	10 1111011111—17
Bailey	01	11	10	10	11 1110111111—16
McKelden	11	01	11	11	11 1111010110—16
LeLeod	11	10	11	01	01 1011111111—16
Jones	10	00	11	10	11 1111111 0—15
Smith	01	01	11	01	11 0101111110—14
Wagner	01	11	10	10	11 1100011001—12
Laird	11	01	11	10	00 0111010011—12
Magruder	10	10	10	10	10 1101010001—10

Re-entries on account of matches missed:

Wagner	10	10	11	10	10 1111110111—15
Laird	11	11	11	01	00 1111011011—19

The final result of the eight matches gives the contestants standing in the following order, each selecting his best six scores, out of a possible 120: E. L. Mills 105, William Wagner 93, William B. McKelden 90, James Smith 85, E. M. McLeod 84, James Bailey 83, R. L. Jones 80, C. H. Laird 72. The shooting has been done under most unfavorable conditions, many days being dark and cloudy, and it is expected that with fair conditions, the team selected, which will be the highest five on the list, will do much better shooting at Chicago.

ANDROSCOGGINS vs. RIVERSIDES.—The second challenge shoot for the Ligowsky championship medal between the Androscoggins, of Lewiston, and the Riversides, of Topsham, came off at the Androscoggin's grounds, in Auburn, May 16, Riversides being the challenging club. A heavy rain prevailed during the entire shoot. Conditions—5 traps, 10 singles, 18yds. rise; 5 pairs, 15yds. rise. The following are the scores. (Figure 3 double shotgun second barrel):

Androscoggins.						
Nason	1011110111	10	00	00	11	11—12

TORONTO, Ontario, May 16.—The first match by the Toronto Gun Club for the President's gold medal opens at the Woodbine to-day, commencing at 2:30 o'clock sharp. The conditions are 15 target balls each, 18yds, rise from a rotary trap, use of one barrel only; five members to compete or no score; to be won three times by any competitor before becoming his property. The following days have been set apart for the matches: May 16 and 30, June 13 and 27, July 11 and 25, Aug. 8 and 22, Sept. 5 and 26, Oct. 10 and 24, Nov. 7 and 21, Dec. 5 and 19.

MENOMONIE, Wis., May 17.—Following is a detailed score of a practice shoot indulged in by the members of the Menomonie Gun Club, on May 15. First shoot—ten clay pigeons each, 18yds. rise, fourth notch:

E F True	1111111111—10	L J Seamans	1111101110—8
E A Benjamin	1111111111—10	S J Bailey	1010111011—7
J R Matthews	1111110111— 9	G H Seely	0011111001—6
G R Brewer	1111111110— 9	R J Flint	1101101103—6

Messrs. True and Benjamin divide first; Matthews and Brewer divided second, and Seamans took third.

Second shoot—Ten glass balls, rotary tray, 18yds. rise:

Bailey	1111111111—10	Brewer	1101111011—8
Benjamin	1111111111—10	Mathews	1010110111—7
True	1111111111—10	Flint	0110110011—6
Seamans	1110110111— 8		

Messrs. Bailey, Benjamin and True divided first, Seamans and Brewer divided second, and Matthews third.

Third shoot, ten clay pigeons, 18yds. rise, fourth notch.

Seamans	1111111011—9	Bailey	1060111111—7
Benjamin	0111111111—9	Brewer	1001111010—6
True	0101111111—8	Flint	1001010101—5
Matthews	1101111101—8	Seely	1010100001—4

Messrs. Seamans and Benjamin divided first, True and Matthews divided second, and Baily took third.—B.

LOUISVILLE TOURNAMENT.—Louisville, Ky., May 17.—Owing to the limited supply of wild pigeons, the Louisville Sportsmen's Association has decided to postpone the tournament until the 23d of June, at which time the original programme will be carried out.—J. O. BARBOUR, Secretary.

Yachting.

FIXTURES.

May 30.—Atlantic Y. C., Opening Cruise.
May 30.—Newark Y. C., Spring Match.
May 30.—South Boston Y. C., Spring Match.
May 30.—City Point Mosquito Fleet, 18 and 15ft. boats.
May 30.—New Haven Y. C., Opening Cruise.
May 31.—Boston Y.C., First Match, Connor and Commodore's cups.

A RIVER CRUISE IN THE HORNET.

SUNDAY, Aug. 5, 1883.—A most beautiful day. The members met on the corner of West Broadway and Canal street. All hands went to church. Boarded an Eighth avenue car to Eighty-fourth street, then walked to the Columbia Y. C. Though we are not members of the said club, we keep our boat at their club house. After some confusion got under way, with a fair wind and tide in our favor. Had a brush with a small jib and mainsail boat, passed her; but she made up for lost time when the wind slacked up. Got as far as Dobbs Ferry, when the tide turned, and we anchored on the west bank of the river, packed the provisions, and all hands went in swimming. Conlague, the invited guest, got stuck in the mud. Met a party in a small cat from Nyack; they, after drifting for about five miles, thought they would anchor. Had a good time together, they promised to keep company as far as Nyack. About 6 o'clock the tide turned, and we got under way with a fair wind on our starboard quarter. Hung our lantern in the stay (did not have side lights) and sailed in company with our Nyack friends. Got very dark, no moon; kept as near shore as possible, sailing along nicely, when we were hailed by our Nyack friends, who told us we had better take soundings. One of the crew shoved the boat hook over and found we were sailing in about three feet of water. Just then the mile pier at Piermont loomed up and gave us a good scare. Went about and thought we would never get to the end of that pier; sailed for about half an hour and the wind got too strong for us, so we put in for shore and anchored for the night; lost sight of our friends. Put up our cabin (forgot to say that we had a home-made cabin, out of an old sail) tried to make ourselves comfortable, but I must say it was not a success. I had a coil of rope and a coffee pot for my bed, the invited guest had a cheese box and a fryiny pan. We were to leave invited guest at Iona Island, to return home by the "Col. Burns excursion" from New York. Was very cold during the night.

Monday, Aug. 6.—Awoke about 4 o'clock. Weather clear and bright with no wind; found we had anchored below Nyack; cooked our coffee on the oil stove, had breakfast of bread, butter and canned beef. The oil stove was a nuisance; blackened everything up. Tide running up the river, got under way and drifted about six miles up. Wind sprung up from the north, and being amateur sailors did not make much time beating. Were passed by the Col. Burns excursion, and became afraid we could not get to Iona Island in time to leave our guest. On getting into Haverstraw Bay the wind had increased to a gale. We took in a reef and had a hard time of it; were nearly run into by a schooner. Reached Iona Island two hours later, and having friends on the excursion we had a good time. Conlague, the guest, was loath to part with us, notwithstanding his uncomfortable couch. Drifted a half mile below the steamboat landing and anchored for the night. All hands turned in for a good sleep.

Tuesday, Aug. 7.—Awoke late, about 7 o'clock (had no watch on board, so had to guess the time by the sun). Head wind still blowing. Cooked breakfast on that oil stove (more misery), got sail up and went across to Peekskill. The boys went to the city and posted some letters and bought some fresh bread. Ran on the beach, and built a rousing fire and cooked a good dinner of bacon and boiled potatoes, which all hands did justice to. Tried to make some headway up the river, but after fooling around for about two hours went over to Iona Island and anchored above the steamboat dock. The boys picked about three quarts of blackberries on Iona Island, and they made a nice dessert for supper. Fished for a while, but soon gave up in disgust. Steam yacht Cadet, from West Point, passed and gave us a salute, which we returned with our fog horn; put up our cabin and turned in.

Wednesday, Aug. 8.—Awoke about 7 o'clock. Cooked breakfast on shore—bacon, potatoes and coffee. Expected to go to Newburgh. Wind and tide against us. Made about five miles, anchored, picked some more berries, killed a small snake. Met a party from Peekskill, who were camped near our old camping place. Turned in early.

Thursday, Aug. 9.—Awoke late. The boys are all getting lazy. All out of fresh water; had to tramp about a mile to a well. Got under way with a head wind; could not hold out against the tide. Laid to till tide turned. Went ashore and cooked our dinner. Got under way again with a light, fair wind from the northwest. Ate dinner on board. A large steamer, with a party of picnikers from Newburgh, passed us, bound for Iona Island. The pilot came very close to us to see who we were. Just as we were running for a dock in Newburgh our throat halliards gave way and the gaff came down on our heads. However, we soon repaired damages and landed at Newburgh. Visited Washington's headquarters and other places of note, bought some bread, got under way and sailed about five miles to Mud Hole, and cooked supper on the oil stove. Turned in about 7 P. M.

Friday, Aug. 10.—Ran the Hornet ashore, cooked breakfast and went to visit the beautiful city of Mud Hole, on the West Shore road. Said town consisted of two houses and a railroad station. Tried in vain to buy some milk. Got under way with the tide. We had to get the aid of some Italian laborers to shove our boat off the rocks. The Clarita, of the Columbia Y. C., passed us, bound up. Cooked dinner on the oil stove. One of the crew tried to clean the stove by hanging it on the boat hook, and lost it overboard. We were glad to get rid of it. Broke one of the oarlocks. Were saluted by the steamboat Eagle. Landed at Poughkepsie about 8 o'clock. Had to skirmish around with a lantern to find wood. Cooked supper and turned in about 10 o'clock.

Saturday, Aug. 11.—Awoke about 8 o'clock, cooked breakfast. While eating, I saw a large muskrat swimming and fired at him, but he dived and we saw him no more. Sailed up to the city, posted some letters and bought some stores; also, got a sail mackerel to fish with, it is good bait for catfish. Inquired where to buy a skiff; but could not find the place. Got under way and sailed about two miles up the river, where we were hailed by some men on a sloop, who told us where to buy a skiff. We found the place this time and bought a small skiff for $3. We were very well treated. The young man also repaired our pump—(if he should happen to read this he will accept our sincere thanks). All the boys were pleased with the new skiff. We got under way and sailed about three miles, and then anchored for the night. A party of young men from the Albany Y. C. were camped opposite us; said they would spend Sunday with us. Turned in about 10 o'clock. Our Albany friends made a great deal of noise.

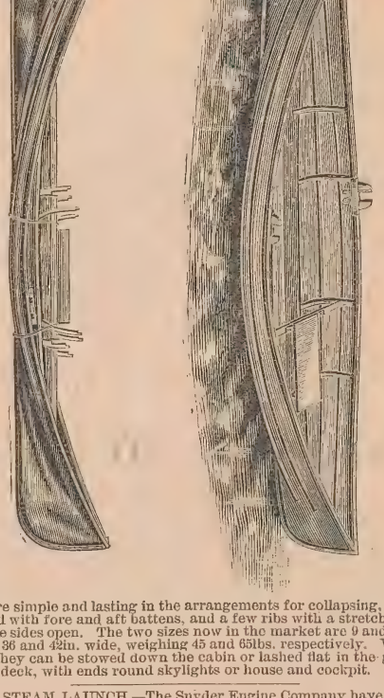
Sunday, Aug. 12.—We camped in a beautiful place. Breakfasted on ham and eggs, coffee and bread. Bender and I went out for a pull in the skiff and upset. The boys had a good laugh on us. We intended to stay over, but our Albany friends invited us to a race with them. We accepted their challenge, but we got left. Landed at Esopus Island to cook dinner. Went fishing and caught a good mess of catfish. Intended to camp at the island, but the crew wanted to go up the river. Saw a setter belonging to a party of gentlemen from Hyde Park swimming across the river. We ran in to cook supper. The boys were about to land when they heard a rattle, which they claim to be a snake, but I think it was a locust. At any rate, it scared us out of our coffee. We turned in on bread, canned salmon and river water, which I may add is very good drinking water.

Monday, Aug. 13.—Woke about 8 o'clock. We and we were camped just below Staatsburgh. Cooked a good breakfast of catfish and bacon, fried potatoes, bread and butter. Two gentlemen got us some ice. All were sitting in the cabin when a steam launch struck us. I got on deck and was about to ask the captain if he was blind, when he sung out in a loud voice, "Want any milk?" We bought some soda crackers and clams from the captain, then got under way, with the wind and tide in our favor. Sailed about five miles when the wind got too strong for us and we put into Rhinecliff. Bought some sugar, then took in a reef and sailed up about ten miles; all went ashore to cook dinner; argument about how we would cook the clams. My brother and I wanted a roast, Messrs. Bender and Laug wanted chowder, so we divided up and cooked them to suit ourselves. We spoiled our roast and the others emptied about one ounce of pepper in the chowder, which made it rather hot. One of the boys went to masthead to fix our flyer. Got under way and sailed a few miles when the wind died out and we anchored opposite Barrytown, Bender and Lang went rowing. Waited till darkness settled and they could not find the boat; we gave up all hope of seeing them that night when we spied them coming up the river at 11 P. M. Blowing very hard, afraid our anchor will not hold.

Tuesday, Aug. 14.—Awake late. Wind still blowing very hard do not think we can sail much to-day. A Sunday school excursion passed up the river and we were saluted by the captain and the young ladies on the barge. Sailed under a reef for a couple of miles, went ashore to cook dinner. I cooked a splendid dinner of beef stew, and stewed tomatoes. Sailed to Tivoli, where we bought some butter in the post-office. Put Bill ashore to cook supper, and he had to swim to the boat as the boys were up to Tivoli with the skiff. Very high wind; got very rough; we had to row to the flats to anchor for the night, which proved very cold.

Wednesday, Aug. 15.—Found we had anchored near the body of a cow which had probably lain on the beach for a few years; the stench was horrible. We got up anchor and drifted to Cruger's Island; after we got the coffee cooked, found we were again out of bread. We had to row across the river to Glascow in the skiff and had a narrow escape from a ducking. Bought some bread in the hardware store. Got under way with a fair wind and started for home. Made good time down the river. About noon we saw a camping party and I went ashore and had a good dinner with them; they were from Peekskill. Spent about two hours with the party and had to row about five miles to catch the yacht. We made Rondout about 2 o'clock and went to the post-office for mail and laid in some fresh provisions. Saw the sloop Corinne of the Jersey City Y. C. Got under way and sailed to Port Ewen; here it was very rough, so we ran behind a breakwater and anchored, going ashore to cook some beef stew with stewed corn and then turned in. It was very rough during the night.

Thursday, Aug. 16.—Awoke about 5 o'clock this morning, and had a hunt after a wounded duck (bell-diver). Fired ten shots at him with my revolver, but did not hit him, but had the whole town out looking at us. I was foolish enough to try and catch him by swimming, but soon gave it up, he was a better diver than I. Got under way about 10 o'clock, and stopped at Esopus Island for dinner. Just as we got dinner cooked saw a tow coming down the river, and started to catch it, but after rowing about five miles we thought we would stop, and stop we did, and ate our dinner. Got under way once more and sailed till about 9 o'clock in the evening, and then anchored just above Poughkeepsie. Saw a large building and thought it was the Vassar College, and proposed to stop and see the girls, but our college proved to be the insane asylum.



Friday, Aug. 17.—Awoke late. Rowed to the city to get the mail and bought bread enough to last till we reached home. Made sail about noon and caught a tow. Found our friends on the Corinne had towed from Rondout. The captain of the ice barge Indian invited us to dinner; and such a dinner! It was fit for a king. Fried ham, green corn, boiled potatoes, hot biscuit, tea and a splendid bread pudding. We complimented the captain on his cooking, for it was good. We agreed to stand watches during the night, but got very cold and all hands went to sleep.

Saturday, Aug. 18.—The captain woke us this morning. Found we were opposite Edgewater. Let go our towline and bade our friend the captain good-bye. Sailed up to Manhattanville and turned in to finish our sleep. Awoke about 9 o'clock, cooked breakfast, had a swim, packed our things and got under way. Arrived at the club house about 3 o'clock. All hands agreed it was the best two weeks we ever spent in our lives. Cost of cruise all told, $24.

CHRISTOPHER HOLDERMAN.

NEW FOLDING BOAT.

THE Ontario Canoe Company, of Peterborough, have brought out a new folding boat of canvas, suitable for service aboard small yachts. They are light and portable, and when expanded are quite stiff and good carriers. Invented by Dr. C. M. Douglas, Brigade Surgeon in the British Army. They are now manufactured to various sizes by the company, and patented for the United States.

They are simple and lasting in the arrangements for collapsing, being supplied with fore and aft battens, and a few ribs with a stretcher to keep the sides open. The two sizes now in the market are 9 and 12ft. long by 36 and 42in. wide, weighing 45 and 65lbs. respectively. When folded they can be stowed down the cabin or lashed flat in the gangway on deck, with ends round skylights or house and cockpit.

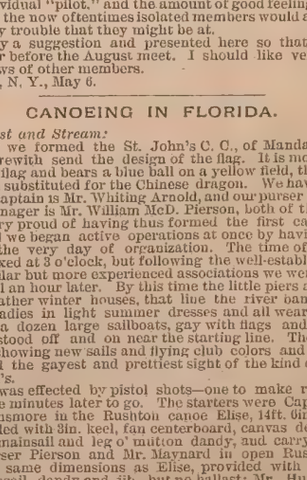
NEW STEAM LAUNCH.—The Snyder Engine Company have built one of their standard launches for Messrs. Wyckoff, White & Foley, of New Brunswick, N. J. She has proved a splendid success. Length, 30ft.; beam, 6½ft.; depth, 3ft.; draft, 26 to 34in.; forward cockpit, 8ft. long; after cockpit, 10ft. long; engine space, 5ft. long; after deck, 4ft. long; forward deck, 3ft. long. Frame, keel, stern post, stem and dead woods of white oak; planking of selected white cedar in longest possible lengths; whales and clamps, Georgia pine in one length; bilge keelsons, Georgia pine in one piece, thoroughly secured to frames; ceiling and decks made of narrow white cedar, a strong oak thwart or beam abaft of engine is properly secured to sides with oak knees, which are bolted to sides; and main beams of deck forward and aft are kneed in same manner. An oak coaming runs entirely around cockpits 4½in. above decks. Planksheer and moulding are made of oak. Large coal bunkers are placed on each side of the boat, abreast of boiler. Extra wide seats extend around forward and after cockpits; cockpits are nicely floored and sides sealed with cedar. Fastenings of galvanized iron and copper; stem band galvanized iron. Rudder, iron, with spare tiller. All work smoothly finished. Hull below water-line has two coats red copper paint; above water-line two coats glossy black; interior, two coats drab. A mahogany and locust steering wheel is erected on walnut frame in forward cockpit and properly connected to rudder with manilla and wire rope. A blue and white canvas awning with wide border, trimmed red, extends over entire length of cockpits. Side curtains are furnished, which button down to the oak coaming, completely closing in the cockpits and machinery. This awning is properly supported by a framework securely erected on turned ash stanchions. These stanchions are held in place by wrought iron brackets. The entire arrangement is portable, and may be taken down or put up in a few minutes. The machinery consists of a Snyder "Little Giant" vertical launch engine, having cylinder 4½in. bore by 4½in. stroke. The boilers are vertical tubular, 30in. in diameter by 50in. high, and are complete with finest fittings. These boilers are of sufficient capacity to generate an abundance of good dry steam for the engine, with moderate firing and little attention. Propeller wheels are two-bladed, 24in. in diameter for the light draft boats, and 28in. for the 30 to 34in. draft. The shafts are of steel, 1½in. diameter. A Hancock inspirator is furnished which heats the water to a high temperature and forces it into boiler either when engine is running or standing still (a decided advantage over the force pump). For use in salt water a keel condenser, made of 2in. brass pipe, which extends from exhaust of engine through bottom of boat along keel, to and around stern post and back to engine room, where it discharges into hot well. A three-way cock in exhaust pipe shuts off the condenser and allows the engine to work non-condensing. This condenser affords constant supply of fresh water and prevents the disagreeable noise which always accompanies the discharge of exhaust steam into the air. A hot well, made of heavy galvanized iron, is located conveniently to take discharge from condenser and furnish inspirator with feed water for boiler. A bilge water ejector is provided and properly connected with steam and outboard for quickly discharging accumulations of bilge water. A jet blower is arranged for use in quickly starting fires.

MONTREAL Y. C.—Officers for the year: Commodore, A. J. McIntosh; Vice-Commodore, C. P. O'Connor; Secretary, G. L. Sait; Treasurer, Walter Jones; Measurer, T. A. Adkins; Sailing Committee, W. H. Stanley, J. J. Roberts, and A. W. Glassford; Club House Committee, W. H. Kirby, W. Bruce, G. N. Roberts, P. C. Falconer, C. A. Lillton. The club has $150 in the treasury, is prosperous, and talks of a new club house. The first cruise takes place on the 24th.

TORONTO Y. C.—Mr. Geo. E. Evans has been elected Captain, vice Mr. G. H. Durgan, resigned. The old time iron cutter Rivet will be out soon with new sails, and add much interest to the racing.

THE NEW ERA.—Says the Brooklyn Sunday *Eagle* very truly: "The inauguration of the Corinthian open sea yachting has caused our amateur sailors to grow more and more venturesome in laying out the courses for their races. Smooth-water sailors are at a discount, and little sloops of thirty-four feet and under now go poking their noses through the big waves off the Sandy Hook Lightship with as much assurance as the largest schooners. This tendency toward open sea work is having its natural effect. There is a larger demand than ever this year for deep keel boats in preference to the centerboard light draft craft, so dear to the hearts of the American yachtsmen for many years. Winter cruising is becoming fashionable, and even the hurricanes to be met and conquered along the Southern coasts only add zest to the sport of the thorough-going yachtsmen of to-day. During the past month a number of yachts have returned from long trips South, the crews telling of storms safely passed through and trials of every kind known to rough old ocean overcome by the staunch little vessels. There seems to be a tendency among yacht builders and designers to strike a happy medium between the light draft, broad-beamed American model, and the deep, narrow English cutter model. The great problem is to obtain lines which will insure both speed and seaworthiness. The Bay Ridge Construction Company and other builders report that the demand for keel boats was never so large as at present. A number of centerboard crafts are lying idle in their yards waiting for purchasers. Ginger bread work in the interior fittings of new yachts is far less indulged in, the preference being for substantial hard wood finishing of the kind that can successfully withstand an occasional salt-water drenching. Heavier spars are the rule among the new yachts, and in fact the yachtsmen are evidently prepairing for what they would call an active outside season of races."

ON SPECULATION.—Several inquirers are informed that the address of Michael Horton is Maverick street, East Boston, and that the cutter he is building for the market is 25ft. long, 9ft. beam and 4ft. 6in. deep. Davis, of East Boston, is also building a small cutter for which A. Wilson is making the sails.



Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc, of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

May 30.—Pittsburgh C. C., First Annual Regatta.
May 30 to 31.—Hudson River Meet, Newburgh.
May 30 to 31.—Connecticut River Meet.

TOLEDO C. C., Toledo, O. Organized March 1884. Commodore, J. W. Hepburn; Vice-Commodore, Chas. O. Phelps; Secretary and Treasurer, G. G. Keip. Nineteen members. Signal 10×15, red diamond and two blue triangles.

CANOE PILOTS.

Editor Forest and Stream:

For some time I have been thinking over the laying before you and all canoeists, and members of the A. C. A., the following suggestions, which, if approved of, can be acted upon at the next meeting of the Association at Grindstone Island.

Our bicycle friends have a system of locating at different points throughout the country, certain specified members of the League of American Wheelmen (which I believe, occupies the same place in the bicycling world that the A. C. A. does in the canoeing), to act as general informants for all bicyclists in giving all the details as to the condition of the roads, situation of hotels, etc., and whom they call "consuls." Why would not the appointment of similar members of the A. C. A. be a great advantage to our paddlers?

The "consul" or representative by whatever name known, if located on any stream could give valuable information to any man cruising in his vicinity as to good camping places, distances, location and extent of rapids, and other facts which if known before starting on a trip, would prevent the occurrence of many unpleasant happenings and save for full enjoyment much time.

Our Association, numbering as it does over 600 members who are scattered over the United States and Canada, could have a "consul" or "pilot" at or near all the canoeable waters and the problem which was discussed sometime since as to the best plan to conduct a "canoe pilot" will be solved. I would have the "pilot" who was located at New York, for instance, have all the maps and information about the waterways near that city, which he would be expected to explain to any member of the A. C. A. who was about to cruise in his vicinity, and so on.

The expense of the maps, etc., would, I feel certain, be gladly met by each individual "pilot," and the amount of good feeling that would arise among the now oftentimes isolated members would amply repay them for any trouble that they might be at.

This is only a suggestion and presented here so that it may be thought over before the August meet. I should like very much to hear the views of other members. TIP.

BROOKLYN, N. Y., May 6.

CANOEING IN FLORIDA.

Editor Forest and Stream:

Yesterday we formed the St. John's C. C., of Mandarin, Fla., of which I herewith send the design of the flag. It is modelled after the Chinese flag and bears a blue ball on a yellow field, the blue ball having been substituted for the Chinese dragon. We have ten members. Our captain is Mr. Whiting Arnold, and our purser and general business manager is Mr. William McD. Pierson, both of this place.

We are very proud of having thus formed the first canoe club in Florida, and we began active operations at once by having a sailing race upon the very day of organization. The time of calling the races was fixed at 3 o'clock, but following the well-established precedent of similar but more experienced associations we were not ready to start until an hour later. By this time the little piers and summer houses, or rather winter houses, that line the river bank here were filled with ladies in light summer dresses and all wearing the club colors, and a dozen large sailboats, gay with flags and laden with spectators, stood off and on near the starting line. These with the canoes, all showing new sails and flying club colors and private signals, formed the gayest and prettiest sight of the kind ever seen on the St. John's.

The start was effected by pistol shots—one to make ready, and a second three minutes later to go. The starters were Captain Arnold and Mr. Dinsmore in the Rushton canoe Elise, 14ft. 6in. long 42in. wide, provided with 3in. keel, fan centerboard, canvas deck, balance lug racing mainsail and leg o' mutton dandy, and carrying 150 lbs. ballast; Purser Pierson and Mr. Maynard in open Rushton canoe Fire-Water, same dimensions as Elise, provided with fan centerboard, mainsail, dandy and jib, but no ballast; Mr. Huntington in Everson Shadow canoe Sunbeam, no ballast, leg o' mutton sails; and Mr. Munroe in Nautilus canoe Psyche, N. Y. C. C., balance lug sails, 50 lbs. ballast.

At this point the river is about three miles wide, and general direction is north and south; the breeze was from S.W. and fresh enough

to put white caps on the considerable sea running, and the course, laid out with reference to it, was one mile and a half close hauled around a stakeboat and return with lifted sheets.

At the start Firewater was first off, followed by Elise, Psyche and Sunbeam in order named. Five minutes later Psyche was leading the fleet, with Elise second. At the stakeboat Psyche had put a dozen lengths of clear water behind her, and rounding with one tack reached the finish an easy winner about the time that the Elise, which was second boat, succeeded in turning the mark. This victory, however, reflects but little credit upon Psyche, as the Rushton boats showed such a height of freeboard that they found it almost impossible to work to windward, and the Shadow was handled by a novice.

As there were not enough paddling canoes on hand to make a race, the sailing match was followed by one in which were eight contestants, and which was won by Mr. J. D. Mead.

We have already seven canoes in the club, and, as several more are to be bough this summer, an interesting season is promised for next winter. O. K. CHOBEE.

MANDARIN, Fla., May 10.

CANOE TRICKS.

ON regatta day the event that interests the average spectator most is the upset race. This little trick, though, has been worked down to such a fine point that the upsetting of a canoe does not seem to impede its speed much, or embarrass the paddler.

In former times, when every man got in over the end of his canoe—if he succeeded in getting in at all—it was an interesting sight to see him crawl along deck, and to bet—if you ever bet at a canoe race—on the chance of his reaching his seat or not.

Now that every one going into an upset race has practiced so frequently that it takes but five seconds to upset, turn the canoe over, and get into place again over the side, the excitement of watching the contest has lost much of its charm, though it still cannot be said to lack a certain kind of entertaining quality.

This upset business is a trick—a knack—and it is but one of many, though by far the best known, as it often is practiced unintentionally. Upsetting a canoe and turning her completely over right side up again, has been accomplished by an A. C. A. member without even getting out of his canoe. To be sure his family have several times realized the insurance on his life while learning the trick. It is quite possible in a canoe as large as the Shadow to walk on deck (minus the shoes) from stem to stern, and it also has been done. Standing up is comparatively easy, even in a Rob Roy, and paddling. It is more difficult to stand, a foot on deck amidship on either side of the well and paddle.

Place a mast in either mast step, crawl out on deck and go round it without getting overboard or upsetting the canoe. It is much more difficult to do than it looks to see it done. Go round head first once then feet first. Ship the rudder from deck after leaving shore. Take two canoes, a foot in each, and paddle without splitting yourself in two parts. Try an upset race with the condition that each man contesting shall get in from the end. Try some of these tricks tandem if you become very expert.

Lots of clever performances can be arranged by stowing costumes below deck, upsetting the canoe, putting your head out of water up into the well, changing your dress and coming up again to view perhaps with a high hat on and a pipe, lit, in your mouth. Some very comical effects can be got in this way. A canoe upset carefully will float on her deck with the bottom well out of water, and will so remain for a long time, keeping the air in. Upsetting with sail aboard is lubberly and usually has no point unless the canoe can be righted again—Dr. Heighway's admirable knack.

Somersaults from deck or well floor into the water, leaving canoe right side up, are very easy and effective; standing on one's head in the well is tolerably simple to accomplish, but it is another matter to do it with the deck hatch for a head rest. Paddling races, using hands for paddles, are usually won by the largest palm—to whom the palm is awarded. Using the paddle on one side only amidship also requires skill to make a "go" of it.

There are many other tricks that suggest themselves to the interested. It is not proposed to have these performances on the A. C. A. programmes, but they certainly lend a charm to scrub matches and club regattas, and are sure to interest your cousins and aunts if they do not feel too much anxiety for your personal safety. The skill in handling acquired by practicing these maneuvers is an excellent argument in their favor; and there is no knowing when a demand will be made on you for some special knack, which if you have acquired will bring success instead of failure to your venture.

The cleverest trick perhaps yet thought of is for two skilled paddlers to give an upset race exhibition, and then suggest to two novices to take the canoes and try their luck, furnishing them with bathing suits. The mule trick at the circus does not hold a candle to it. Cases have been known where persons were made temporary ill by excessive laughter by the attempts to right an overturned canoe. It looks so easy, you know.

I pass. Who trumps this card and takes the next trick?

SEA BEE.

LEAKS IN BIRCH BARK CANOES.

Editor Forest and Stream:

In response to inquiry regarding leaks in birch bark canoes, let me recommend rosin with about one-eighth its weight of lard. A little beeswax will render its consistence more constant under changing temperature, but it sticks better without it. Apply hot to seams with a stiff "sash tool." In case a hole is "stove," cover with a piece of birch bark well smeared with the warm gum. In case no bark is to be had, an old handkerchief, coat lining, or shirt will do. A woodsman is never at a loss.

Don't leave the birch bottom up in the sun to dry, nor yet try the so-called Indian method of drying it with a torch. The sun will cause the gum already on to run off, and unless the torch is used cold, it will blister the bark. Wipe as near dry as possible with a cloth, and in ten minutes it is ready for the gum. Never leave the gum tins behind. NANCY BELL.

Editor Forest and Stream:

Having been troubled some to get the right mixture of pitch, etc., for bark canoes, I am satisfied that made with the following proportions it will do good service: 11 ozs. of resin, 1 oz. of prime tallow, 1 oz. of boiled linseed oil. Melt over slow fire and mix thoroughly. This will be firm but not brittle. WENONAH.

BIDDEFORD, Me., May 16.

MY FIRST CANOE CRUISE.

THIS was made away back in the forties. My craft was 11ft. long by 15in. beam, was built of three pine boards, was sharp at both ends, and propelled by a paddle, so of course might be classed as a canoe. It was rather uncouth, both in shape and workmanship, being made of 1in. stuff, besides being the work of a boy of eight years, whose tools consisted of an axe, hammer and common wood saw, supplemented by the ever handy jack knife to finish with.

The bottom was first hewed into shape with the axe, then the sides, after being sawn nearly through and clear across, so as to bend readily, were nailed to the bottom with such nails as could be picked up, pulled out of boxes, etc. To make it tight, I used strips of cloth saturated with roofing tar (pilfered from a mill which was building hard by). When finished, my craft would weigh probably some two hundred pounds, and to my eye was the finest piece of work in the country.

My paddle was a single blade, made from 1in. pine board. When all was completed my craft was launched on the mill pond, and made its trial trip in about an equal mixture of water, sawdust, eel-grass and lily pads. It proved a success, and I was as proud as a commodore.

But the mill pond was too small, and so when a neighbor, who was going up river with a team, offered to carry my craft and myself to Fitchburg, some fifteen miles, I took advantage of the offer, and the next morning, bright and early, saw me perched on my cherished boat, which was stowed bottom up in a large lumber wagon, and all rattling away up river.

My craft was unloaded beside a small stream, a tributary of the Nashua, and I was soon paddling down the swift current. My outfit was very simple, consisting of a roll of tea matting, a pocket knife, a small tin pail filled with bread, butter, and a fair share of that pride of the New England boy's heart, doughnuts, and the clothes I stood in. How I worked on that cruise, pulling over shoal water, tugging around dams, and fighting the mosquitoes, for it was the sweet summer time, and I slept in my boat drawn up on the shore, where had a fair chance at me.

I had some troubles, was picked up for a truant once, and jumped one dam; but not because I wanted to. My trip lasted a week, and ended at Lawrence on the Merrimack, where my father found me and urged me strongly to go home with him. I went. My next cruise was around the "Horn," and in the course of which I wished several times that my father would come and take me home, but he didn't, and by the time I got back I was used to it all, and had become very, very salt.

I am fresher now, I sometimes go over the ground again in fancy, and as the two cruises are always connected (in my mind), that looking back at them they are but one. The whole course of my life seems to have been decided by that little trip down the Nashua and Merrimack rivers. Ah, me! What possibilities if I had not been born web-footed.

But to change the subject before I get sentimental. Have been out in my canoe all day; paddled some twenty-five miles; caught a dozen sea trout and one duck, a moist one. Having a howling norther here to-night. Am very glad I am so near the equator. The next move I make will be south. TARPON.

TARPON SPRINGS, Fla., May 9.

PERSONAL.—Mr. C. K. Munroe, N. Y. C. C., returned to New York on Monday last, after spending the winter in Florida. Mr. Chas. L. Norton, N. Y. C. C., in company with Mr. H. B. Howard, started from Philadelphia on Monday last for New York in the tandem canoe Kittiwake.

CLUB SIGNALS.—We have received sketches of signals from the Howard C. C. of Cambridge, the Hub C. C. of Boston, and the Potowonok C. C. of Fort Madison, Iowa.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

E. C.—We are unable to give you the address.

H. v. L. New York.—Is a man shooting in sweepstakes or for mon prizes termed a professional? Ans. No.

S. J. B., Philadelphia, Pa.—Lapstreak is lighter and better. The cost will be from $5 to $7 per foot length, according to quality.

J. J., Pine Plains, N. Y.—The pointer bitch Cara C. is registered the first number of the *American Kennel Register*. Her number is 18.

T. B. D., Ellicott City, Md.—Ruby is by Woodruff's Dick out of Fawn. We know nothing of the collie Eske; perhaps some of our readers can give his pedigree. The fox-terrier is a sporting dog.

H. W. G.—Would you kindly inform me if there is any black bass or trout fishing near Saratoga Springs, and when the season begins in your State for fishing? Ans. Yes, both. Season begins on June 1.

C. J. V. A., Albany.—Can you tell me when is the best time to fish for carp, and what kind of bait or flies to use? Ans. Morning and evening. Use worms, dough, boiled peas or fresh beef. We do not know that they will rise to the fly.

C. J. W.—I have a new rod, all lancewood, weight 3¼ ounces. Is it too light for bass? I am not a very expert angler with such light tackle. Had I better exchange it for a heavier one, say about 10 ounces? Ans. The rod is too light; we would exchange.

C. L. W.—Will you kindly inform me what make, weight and length split bamboo fly-rod you would advise for Rangeley Lake fishing? Ans. A rod 10½ to 11 feet and weighing 9 to 10 ounces. We cannot recommend any particular maker. See our advertisements.

TEACHER, Cadiz, O.—Where and when shall I go during the summer months to find excellent bass fishing in Lake Erie and Lake Huron? 2. Can we find camping ground? 3. Can you give address of sportsman's hotels? Ans. There is good bass fishing at Kelley's Island in Lake Erie, and also at St. Clair Flats. 2. You can camp at the Flats. 3. No.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF HORSES, CATTLE, SHEEP, DOGS, HOGS, and POULTRY.

FOR TWENTY YEARS Humphreys' Homeopathic Veterinary Specifics have been used by Farmers, Stock Breeders, Livery Stable and Turfmen, Horse Railroads, Manufacturers, Coal Mine Companies, Trav'g Hippodromes and Menageries, and others handling stock, with perfect success.

Humphreys' Veterinary Manual, (399 pp.) sent free by mail on receipt of price, 50 cents.

☞ Pamphlets sent free on application.

HUMPHREYS' HOMEOPATHIC MED. CO., 109 Fulton Street, New York.

NERVOUS DEBILITY

HUMPHREYS' HOMEOPATHIC SPECIFIC No. 28.

Vital Weakness and Prostration from over-work or indiscretion, is radically and promptly cured by it. Been in use 20 years, —is the most successful remedy known. Price $1 per vial, or 5 vials and large vial of powder for $5, sent post-free on receipt of price. Humphreys' Homeo. Med. Co. Illust. Catalogue free.] 109 Fulton St., N. Y.

ABBEY & IMBRIE,

Manufacturers of Fine Fishing Tackle

48 and 50 Maiden Lane, New York City.

We beg to call attention to our new 120-page folio Illustrated Catalogue. We have spared neither labor nor expense in our effort to make this the most complete work of its kind. We will send a copy, postpaid, on receipt of 50 cents, which price does not nearly reimburse us for its cost.

FOREST AND STREAM: "The list is surprising, even to one familiar with such matters. The great merit of this catalogue is its accuracy."

AMERICAN ANGLER: "It is, without doubt, one of the most complete and elaborately illustrated catalogues that has ever been issued in the interest of a private firm. This catalogue may be classed as a *text book*, owing to its practical value to the general angler."

NEW YORK EVENING POST: "The amount of ingenuity exercised in devising means to capture fish becomes apparent only upon study of such a catalogue of fishing tackle as Abbey & Imbrie, of New York, have just published."

SCIENTIFIC AMERICAN: "The book has 92 large plates, covering almost every conceivable appliance in this line, and in such profusion of styles as would probably delight even our most expert of fishermen, President Arthur."

MAIL AND EXPRESS: *"To the practical angler the work is indispensable, as it shows him just what to get."*

SILK WORM GUT.

F. LATASA, 35 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00. For price list address

Fishing Tackle.

Rods, Reels, Lines, Artificial Baits

OF EVERY DESCRIPTION.

Flies for all Waters.

Special patterns tied to order.

APPLETON & LITCHFIELD,

304 Washington St., Boston, Mass.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.,

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON as above.

Eaton's Rust Preventor.

For GUNS, CUTLERY and SURGICAL INSTRUMENTS. Specially adapted for salt water shooting. For sale at all principal gun stores. Western trade supplied dy E. E. EATON, 53 State street, Chicago, Ill. Cannot be sent by mail. Manufactured solely by

Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., $1.00; nickel plated, 50 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sproat, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeen, Sneak Bent, and all other hooks. Single gut, 12 cts. per doz.; trebie, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders. 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, $1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, $1.25 to $5.00. Trout and Black Bass Fly Rods, 10ft. long, $1.50 to $10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 20 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

KYNOCH'S

Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

HERMANN BOKER & CO., Sole American Agents,

101 & 103 Duane Street, New York.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, MAY 29, 1884.

VOL. XXII.—No. 18. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

RATTLERS AND RATTLING.

THE lying proverb that all is fair in love and war has been a convenient excuse for all sorts of rascality ever since it was first uttered. A fair stand-up fight has no tricky features about it, and every move of either contestant in a battle is fair according to the rules of equal opportunity or it is the unfair advantage sought by an antagonist who stands in self-confessed inferiority. It matters not whether the game at stake be a crown and its dependencies and the subterfuge the deceitful approach of an armed force under cover of a flag of truce, or whether it be a match before the trap for a medal bauble and the trick of the beaten team be one of an hundred well-known devices by which one marksman seeks to "rattle" or confuse another.

We recall with pleasure the stately courtesies which marked the opening series of matches between the American and Irish teams of riflemen. It was one company of gentlemen working with another company for a common aim. Each was intent on making as big a score as it was possible with the arms and experience at its command, and each expected the other to do the same. Defeat came to one side, but it did not bring with it any feeling of vindictiveness. Those who failed to make the better score knew that they had done their best, and they knew, too, that they had received the best wishes of their antagonists, and they were the first and most sincere of those who heaped congratulations upon the winners. It was not a match in which the utterance of such a word as "rattling" was heard. Instead, the match at Creedmoor and again at Dollymount was made the vehicle for the conveyance of many expressions of good will. It was, in short, a match conducted strictly according to the conditions laid down for it, yet without for a moment losing sight of the gentlemanly courtesy due at all times from one individual to another. There was no sinking of the gentleman in the sportsman, or rather, there was a proper blending of the two, as there always may be and should be, if the greed for victory does not crowd out of sight the natural instincts of fair play, which every true sportsman feels.

In many trap contests we have seen the same regard for the rights and feelings of the antagonists manifested that marked the rifle matches to which we have referred. Visitor marksmen or a team from a distance were treated as guests of the home team rather than foes to be beaten at any cost. It was recognized on both sides that there was to be a trial of skill and that with equal opportunity and barring mishap, the most skillful among the group of contestants was sure to win. Such meetings were of good effect in so far as they encouraged the patrons of trap-shooting to seek their own advancement through honest endeavor and diligent effort. Each man sought to improve his own style and accuracy because he was sure that success would follow such attention to detail. It was, in short, an exercise where there was improvement in real merit because such merit was recognized at the scoring point.

There is another side to these pictures, however, and too frequently they are brought to public attention, to the disgrace and scandal of true sportsmanship. In these contests the only criterion is that of victory. It matters not how it is gained only that the final showing gives at least a nominal success. There comes in then the fine art and low cunning of the "rattler." Professionalism in the worst meaning of that much-abused term comes out in all its force, and while perhaps the letter of the conditions may be strictly observed, the spirit of the conditions, which is after all the spirit of fair play, is completely thrown to the winds. The intention of each side is not for a trial of skill or victory founded upon superior merit, but rather for a test of subterfuges, for such a series of surprises for the enemy as shall snatch victory from his grasp. There are surprises which may be perfectly honest. If A, by putting thought and brains into his work, shall produce a gun, closer shooting, harder hitting and surer in its fire than any that have heretofore been used, and shall introduce it to the attention of B, through a match, he is entitled to all that his brain work shall bring him. He has earned his victory, not perhaps by being content to do better work with an inferior gun, but by producing a better gun and thereby insuring better work. Such a step is fair and honest; but it is quite another matter to snatch victory, at least on paper, by resorting to the many confusing tactics of the professional "rattler."

It would be a waste of space and time to go into all the unpleasant details of the progress of a match in which the arts and devices of those who win by trickery are brought to play, and once this sort of thing is countenanced there is no limit to the extremes to which it may be carried, and a match ceases to be more than a measure of rascality.

In the past the FOREST AND STREAM has found occasion to administer some sharp rebukes to the mug-hunting, mercenary spirit which in large measure lies at the foundation of the evil under consideration. Rivalry is the life of all such gatherings as those before the trap and the butts; but that spirit of rivalry is quickly quenched when the spirit of greed comes in and is allowed to run full sway without the control of gentlemanly courtesy, and that observance of the intent as well as the mere letter of formal conditions.

A gun club may organize pretty much as a band of pirates is drawn together, by a common motive of plunder. It may for a time carry its own by sheer dint of worrying its opponents; but in the end it kills by the mere crushing out of all the true sportsman's feeling, which is, that the reward of sport is in the exercise itself and not in such results as may be turned to base material advantage.

NATIONAL BENCH SHOW ASSOCIATION.—The Westminster Kennel Club have taken the initiatory step toward the formation of a National bench show association. They have sent to all of the prominent kennel clubs a circular letter requesting the attendance of some of their members at a meeting to be held in New York on June 21, for the purpose of consultation regarding the formation of such an association. That the call will meet with a hearty response there is not the slightest doubt. We look forward with much interest to the meeting, believing that its action will result in great benefit to the breeder and exhibitor, and in increased usefulness and popularity of our bench shows.

LUCK.—It is reported that a rich vein of coal has been discovered on the lands owned by the Woodmont Rod and Gun Club, on the Potomac. If the prospector is right about the find, there will be millions in it for the club members. This is an instance of virtue rewarded, as it should be. The club's motto is "Protect and Enjoy." The usual motto is, "Enjoy, and if anything is left let it protect itself." The Woodmont anglers deserve their luck. They have demonstracted beyond all question that game protection—with a coal mine, an oil well, or a gold reef thrown in—pays.

PISTOLS AND CHILDREN.

AN arrest made Monday in this city was the first under a recently enacted ordinance, which prohibits the sale of pistols to minors under the age of fifteen years. A boy had been sent on an errand to purchase a pistol, and the fact coming to the notice of the police, an arrest followed. There has been in the past a great deal of trouble over the firearm question as affecting children. There would seem to be a natural fever on the part of every boy at some time to own a pistol. It may be the most dangerous possible contrivance, and the very fact that this danger is unforeseen only makes it the more to be dreaded. To meet this demand of the lads and the measure of their pockets, the firearms companies have sent out a series of alleged pistols which have only cheapness to recommend them. They have neither strength nor accuracy nor beauty in their favor, and there exists no pretense of a reason to justify their manufacture.

In this city, where the evils which naturally follow in the train of such deadly contrivances are so manifest, there have been many ordinances and local laws aiming to reduce the disastrous consequences which follow this pistol-carrying mania. There are laws which make it necessary to secure a permit for the habitual carrying of a pistol; but still the boy nuisance remained, and the more recent ordinance naturally followed to reach this trouble. Rigidly enforced, it will do much toward reducing the trouble to a minimum, but the real remedy is to be found in a complete suspension of this useless class of arms. If this be brought about by a general prohibition of their sale, good. An arm of service is one thing, but a dangerous toy, placed by mercenary manufacturers in ignorant, innocent hands, is quite another.

LARGE TROUT.

ACCOUNTS of the capture of large trout are now in season, and in reading them one must always consider the locality where the fish are taken. For instance, a trout of five pounds taken in the waters of Maine or of the Sault Ste. Maria would not be a remarkable fish, while, if taken in the waters of New York, Pennsylvania, or Vermont, it would be considered a monster. New Hampshire papers chronicle a catch of 127 trout, taken by Eugene Batchelder and John Lynch, of Claremont, which contained many fish of six to eight ounces, as the finest catch in years.

From Pennsylvania comes the account of the largest trout taken in Pike county in ten years. It was taken by Thad. Mercer in the Little Bushkill, below the lower falls, last week, and weighed four and a quarter pounds. Previous to this the largest trout taken in Pike county was taken a dozen years ago at the mouth of the Sawkill, and was a quarter of a pound heavier than the one mentioned above. Both these fish were taken with the worm. This region has furnished several large trout. One came out of the Beaverkill and was exhibited in Barnum's Museum before it was burned, and as it was said to weigh six pounds, there were many in those days who doubted that a brook trout ever reached that weight.

The largest wild trout that we know of being taken in the State of New York, was taken by A. R. Fuller, of Meacham Lake, Franklin county, in Clear Pond, near Meacham, and weighed five pounds.

From Maine come the largest trout taken in America. The great fish taken by Mr. Geo. Shepard Page, of ten and a half pounds, weighed after being out of water for two days, and the eleven and a quarter pound fish sent to the Smithsonian, have never been beaten. Last year a trout was taken in the Rangeley Lakes that weighed nine and a half pounds.

RAILROADS IN THE NATIONAL PARK.—There are abundant reasons why no railroads should be allowed in the Yellowstone National Park, but the Cinnabar and Clarke's Fork Railroad Company are untiring in their attempt to lobby a bill through the Senate at Washington, giving them permission to construct a road through the Park. Government officials, paid liberal salaries, are found, who shamelessly lend themselves to helping on the nefarious scheme, and only the vigilance of honest Senators can thwart the job. The subject came up in the Senate last Monday. Messrs. Vest, Logan and Voorhees spoke in opposition to the bill, and Mr. Sawyer would have shown what a fine thing this road must be to the dear people, but he was not given a chance to deliver himself. The monopoly granted to the Hatch concern was a national disgrace; to permit this railroad company to grab what they have the presumption to demand, would be another cause for humiliation among right-thinking citizens.

A NEW FLORIDA BOOK.—Dr. J. A. Henshall's new book, "Camping and Cruising in Florida," is now in press and will be issued shortly.

The Sportsman Tourist.

A STORY FOR DECORATION DAY.

IT was midwinter in war times; the scenery mountainous; the weather cold, dark and cloudy; time, about 6 P. M. The battle had been fought and victory perched on our banners; roll call was over, and the weary troops had gathered around newly-made camp-fires to prepare their scanty suppers of coffee and hard biscuit. The camp kettles, suspended on rails resting on forked sticks, were beginning to steam. The dark clouds that had gathered over the battlefield, heavily charged with chilling rain, became threatening and might at any moment pour down their unwelcome floods on the unsheltered heads of the devoted men who were scattered around and trying to draw some comfort from the cheerful blaze and the prospect of a cupful of hot, strong coffee. Some of them had taken off their shoes and were rubbing their sore feet; others were sitting on rocks and rails talking in low, broken murmurs, as they recalled the conflict and spoke the name of some fallen comrade who had dropped by their side; others lay prone on their backs, silent, their right arms drawn across their eyes, their minds, no doubt, wandering back to their peaceful homes on the broad prairies or sheltered woodlands of the Northwest. A little in the foreground stood long lines of stacked rifles, along the further side of which paced the sentinel, weary but watchful, guarding those trusty weapons that had done such good services during the day. Still further in front was a different, but more sad spectacle; long ranks of dead soldiers lay side by side, wrapped in their blankets, ready to be laid in the shallow trench then being prepared for their reception. Still further to the right appeared the flickering lights at the field hospital, where the faithful surgeons were doing all, by their skill and goodness of heart, to allay the sufferings of the wounded. Such were the scenes that passed in quick review before the eyes of the writer as he sauntered around to see how the boys felt after their hard fight, and to make inquiries regarding the fate of true and trusted comrades.

But the kettles begin to bubble and boil, while a pleasant aroma floats around the camp-fire, arousing the boys, who bestir themselves, and hunt for haversacks and tin cups preparatory to dipping in and soaking their hard biscuit. All is now animation; jokes and banters pass around, gloom is dispersed, and cheerfulness asserts her ever potent power for good.

But I must return to duty, and find Black Tom, who is neighing for me at a short distance. On my way I pass regimental headquarters, established around a large brush heap, then burned down to a bed of burning, glowing coals. No tents, no camp stools, nothing but an orderly holding some horses by the bridles, and the mess cook and major trying their best to make some coffee without scorching their faces. The colonel is sitting at the foot of a tree, the other officers, among whom there are several captains, are scattered around, some sitting on the ground, others lying flat, all holding an animated discussion regarding the fight, the sulphurous smoke of which yet adulterated the air. Leaning against a tree, I stood a silent spectator of the picturesque scene. One of the group, a tall, handsome officer, wearing a captain's uniform, remarked, rather emphatically, "I don't understand why the General does not follow up the advantage and capture the last d—d man of them." The words had scarcely passed his lips when an orderly rode up, jumped from the saddle, ran his eyes around the group, advanced to the colonel, saluted, pulled from his belt a bunch of orders, handing one over, turned on his heel, mounted, and was off. That officer read the order, jumped to his feet, remarking, "The fight is not over yet, your wish is gratified." The order, in brief, was a call for four companies under a field officer, provided with three days' rations, eighty rounds of ammunition, in light marching order, nothing to be carried but pouches. The battalion to march at once to the rendezvous, where the ammunition and cracker wagons awaited them.

This meant fight, and all was bustle in a moment; "get ready," ran down along the camp-fires. The men gulped down their scalding coffee, hardly taking time to wet the flinty bread. No detail was made, but volunteer companies called for. The order to fall in was promptly obeyed, and the officers in charge put the question, "All you that are in favor of a three days' force march on hard tack, and plenty of fighting, will hold up your right hands." Every hand was up in a moment; and the captain without as much as "rest" or "break ranks," turned on his heel and reported his company ready. This was all done in far less time than it takes to write it, and the first four companies reported were accepted, while the others, every one of whom had promptly responded, were chagrined and disappointed at being left. These brave fellows, footsore and battle-weary, were ready to start off on a three days' forced march, loaded down with dry bread and double allowances of cartridges, in the dead of winter without a blanket or overcoat, with every indication of fallen weather, to fight against heavy odds with a fair prospect that it was the last march they would ever make, for they knew not what they were to be dashed against. Yet these self-sacrificing heroes, all actuated by the same spirit of tenacious bravery, self-sacrifice and lofty patriotism, were striving for places in that forlorn hope, cheerfully offering their lives as a willing sacrifice in the protection and upholding of our dear flag and country. Of such was the material composing our volunteer army. May every American boy, be his home in the North or South, East or West, be inspired by the same noble principles. But I am digressing.

Catching the spirit of reckless adventure that took possession of all, and although my duties led me in a different and safer quarter, yet I hurried to headquarters and offered my services as commissary and quartermaster of the expedition. The General looked at me incredulous; his eyes seemed to read my very soul; he answered, "No train accompanies them," but after a little reflection he continued, "however, you may go, although they will have no use for your services," and pencilled a brief order to that effect. Grasping the order I hurried to my horse, sending an orderly to the train informing my assistant of my detail for three days, then turned Tom's head toward the rendezvous.

A few days previous the cavalry had brought in a company of mountaineers as prisoners. They were brought past the train to be disarmed. These men carried long, ancient rifles of the old frontier pattern. The officer captured with them was a young, handsome, dashing fellow, dressed in a suit of home-made gray jeans, no doubt the handiwork of his mother or sister or wife. It was cut in the Confederate regulation style, with three gold bars on the collar; it fit to perfection, and he looked every inch a gentleman and soldier. His arms consisted of a rifle, supported across his back by the sling, and a deer-skin pouch well filled with cartridges. I was standing a short distance from him, and noticed him beckoning me to approach. When close up he said, "I am in for the bull pen" (meaning the military prison); "this is my private property" (disengaging his rifle); "I make you a present of it. It is the best piece you ever handled; take care of it." The command, "Right face, forward march," was given, and he disappeared. I examined the piece minutely. It had a 30-inch barrel, about .35-caliber, weighed 7½ pounds, silver-mounted; in fact one of the neatest rifles I ever handled, and after trial proved to be the finest rifle I ever shot. The pouch contained a quantity of hand-made cartridges, with extra large charges of powder, no doubt intended to kill Yanks, but afterward used for the better purpose of saving them. This rifle and pouch were strapped to my saddle when I mounted to join the rendezvous.

Reaching the place I found four battalions of infantry, and two small mountain howitzers, and two ambulances. The fighting force was about one thousand strong, quite a small detail to tackle a whole division of the enemy that had been cut off and were then in full run for the river, some eighteen miles distant. The men having filled their haversacks with crackers, and their boxes and pockets with cartridges, the line was formed and we started south at a swinging gait. The colonel in command, with whom I was riding, enlightened me as to our destination. We were to make straight for the ferry or ford, and if in time, to dispute the passage, and to hold the same until reinforced; but if too late, then we were to push down the left bank and prevent a recrossing, and harass the retreat as much as possibe. In passing along the line to the front, one of the officers jokingly asked me, "What are you going to do with your popgun?" I answered, "Keep the boys in meat." The men caught my answer and hoarded it up for future use, and paid me back in double measure.

The march was silent, rapid and unbroken. Sunrise found us at the river, the last of the "Johnnies" disappearing on the opposite side, and the ferryboat, a trap run by horse power, putting down stream at her top speed. A few shells were sent after the broken and retreating foe, there was a brief rest, and then the head of the line was turned down stream. By this time the long threatened rain had broken loose, and poured down in torrents; but there was no rest nor shelter for us. On we went the whole day. A little before dark, on turning an abrupt bend in the river, camp-fires were seen on the other side, and the ferryboat tied to the bank. To place the guns in position and throw a dozen shells into the midst of them was the work of a few minutes. They thought the whole Yankee army was on them, and off they went, wagons, boat and all, soon disappearing beyond the woods. With brief intervals of rest, the chase was kept up for three days and nights, several times frustrating the enemy's attempt to recross and join the main column then on the retreat further north.

On the second day out, I was riding along the line, when the boys noticed me and called out, "Hallo, Crackers, where is our meat?" the chorus being taken up by all, and "bring on your meat," met me on every side.

When starting I had been told, and had expected that my position of commissary and quartermaster would be a sinecure, but alas, here I was face to face with more than a thousand hungry mouths to fill, and scores of miles from our base of supplies, and still marching further. What was I to do? I felt for the boys, and their repeated calls of "bring on your meat," were prompted by a deep-seated feeling of necessity. I went to the colonel and told him that I would ride ahead and see if I could find some stray cattle or hogs if he would let the men dress and cook them, to which he readily assented. I started at once, and scoured the country for miles on the left of the column, hoping at every turn to find a sturdy cow or hog, but to no purpose, the country had been closely foraged before us; and night found me spurring on after the men empty-handed. I was ashamed and almost afraid to see them, but face the music I must. The first question was, "Well, Crackers, what luck?" None. Trouble was afloat in a moment, and "bring on your meat" met me at every turn.

Next morning before day found me miles from the line of march, determined to hunt something for my hungry comrades. And a more faithful searching hunt a man never made. Up the hills and down the valleys I went, perhaps I could get a deer, a pig, anything. I would have been tempted to have killed a mule had I found one. But no, the country was silent, and barren of hair and feather worth carrying to camp, and must have been scoured by hungry men before me. The middle of the afternoon found me again with the command. I was met on every turn by the hungry cry, "Bring on your meat." I was desperate; yet had I not voluntarily assumed the responsible position, and to whom else could the men look for meat?

When I reported my failure to the commanding officer, he looked daggers at me, pulled out his watch, looked at the time of day; two hours to sundown, the last cracker gone, in a section very sparsely settled, the men almost broken down, and hungry, their feet wet and blistered. The rain which had poured down on us during the past two days had spent itself, and the sky was bright for the first time. A halt was called, and a council held. All had been animated by the hope of catching up with the fugitives, and giving them battle, and there had been glimpses of them at intervals during the day, pushing down the other side of the stream, and trying to effect a crossing. But now a new enemy met us, hunger. What was to be done? To retrace our steps was starvation, to proceed further would be disobeying orders, or at least, stretching them beyond excuse. It was finally decided to change our course, and march north in the hope of striking a settlement that had not been closely foraged. I was therefore ordered to take the first left hand road and find a suitable bivouac for the night. Spurring on, I found a cross road within a short distance of where we stopped, and I called their attention to it. All was soon in motion, and I went cantering along to perform the duty assigned me. Mile after mile I rode, but no break in the pine forest. I found a deserted cabin with a small clearing, but no water, that would not do; so on I went a mile or two further. I began to despair of relief for the troops, and determined to select the first spot that afforded wood and water and trust to the morrow for provisions.

Night was coming on, still there was no break in the forest. I felt sad and sick at heart thinking of the hungry, footsore boys behind me, who were looking ahead at every turn in the road for me and relief. I slackened my pace and permitted my poor, faithful horse to walk up a sharp incline in the road. My rifle was lying in front across my saddle, the reins loose on Tom's neck. My thoughts took flight and were away off in my own home. There I met my wife and baby, Mary; tears, hot, scalding tears, ran down my cheeks, my heart was full, for the moment I had forgot my duty, and was slowly repeating the following stanza:

> "Methought from the battlefield's stern array
> That I wandered far on a desolate tract;
> It was evening, and sunshine arose on the way
> To the home of my loved ones, who welcomed me back."

I had repeated half of the next, when my horse came to a sudden stand. I looked up, brushed the tears from my eyes and looked around. I was on the brow of the ridge, and right in front of me, in the valley beneath, lay a beautiful farm. Half a mile distant were the farmhouse, barns, and orchard. The smoke rose from the chimneys and eddied away in the evening breeze. The tingling of a cow bell came floating up the hill, and a lot of cattle stood in the road in front of the homestead. Stacks of fodder stood by the barn, and turkeys were flying up to roost. In a field back of the house, that stretched within two hundred yards of where I sat, there was a small flock of sheep grazing in apparent security. There was plenty, if not peace, within my grasp. How long I sat gazing at the peaceful scene before me I know not, but the clear neigh of a horse away at the foot of the hill behind, told me that the column was near.

In a moment my course was mapped out. I would tie my horse, creep to the fence, shoot down that flock of sheep, and buy them afterward. When I reached the fence I was within from sixty to one hundred yards of the flock, sixteen in number and large ones. I steadied my nerves for the work, determined that every shot should count. Dropping down in the fence corner out of sight, I loaded and fired in quick succession. One after the other of those innocent creatures dropped to my shots. I seemed to be inspired; not a bullet missed its mark, and just as the last one fell the head of the column appeared on the top of the ridge on my right, and an angry farmer came running across the field on my left. When the pleasant view burst on the eyes of the weary, hungry soldiers, they broke out in loud cheers, which drew the attention of the farmer, who took in the situation at a glance. He stopped short, looked first at the troops, then at his bleeding flock. I went up and tried to explain matters, but after listening a while he turned on his heel and started off without a word. When distant about twenty steps he turned and said, "Stranger, come down to the house, will you?" and left.

After seeing big roaring fires of dry rails ablaze, and the sheep stripped of their pelts, which was a wonderfully short job, I went to the house, and was kindly received by the host. All were in a state of abject fear lest the men would come down and do all kinds of bad things, as they had been told would happen when the hireling Yankees would come, but seeing that I was a human being, and rather a kind one at that, the children came up to me, and when I told them of my own little darling at home, they became reassured, and when I asked for a piece of bread, for I was hungry, that true spirit of American hospitality came to the front, and the oldest daughter, who had been very shy, brought me some sweet milk and light bread, which proved a treat. After assuring them that we were friends, that nothing should be disturbed, and that we would pay for everything in good greenbacks, they became sociable and obliging. The old gentleman offered to haul a load of sweet potatoes to the camp at thirty cents a bushel, and priced his sheep at two dollars and a half a head, all of which was paid. We even paid him for the rails we burned, for he proved to be a good man, and befriended us in a pinch. What a feast we had that night, roast mutton and sweet potatoes. The men dried their clothes and got a good night's sleep on that hillside.

The next day, with a supply of sweet potatoes stored in haversacks and ambulances, and our horses well fed with sweet fodder, we turned our faces campward, receiving accurate directions from our host as to the course, and on the third day we reached our tents without the loss of a man.

This perchance may meet the eyes of some of the boys—now old men—who helped eat the mutton, if so, they will know that "Crackers" still lives. CAPE ROCK.

Natural History.

THE BALTIMORE ORIOLE.

(Icterus Galbula.)

WHAT a beauty! Yes, you may well say so. Observe the taste he displays in his dress—orange and jet—a most perfect combination. The colors, too, so rich and of a brilliancy I have rarely seen surpassed. The fine fellow is the dandy of his family, his modest spouse affecting a more quiet costume and appearing, in consequence, all the more lovely by contrast. A joyous, rollicking chap is "Baltimore," and a gay life he leads, spending most of his time in the treetops, from whence his clear, ringing calls come down to us with the rush of the breeze through the foliage. There is a wild freshness about the life of this bird that imparts an indescribable charm to him. The home he builds is a marvel of ingenuity, and so well is it put together that with a little repairing it often answers for the second season. Many times I have found it half filled with the husks of beechnuts and empty acorn shells, remnants from the feasts of tree mice, who took possession after the rightful owners had vacated the premises. With us he is inclined to favor the beech as a building site, no doubt from the fact that its twigs are stouter and less liable to snap in the strong gusts which sometimes sweep among the boughs.

Way out, in the last fork of some gracefully drooping branch he will tie the foundation knots of his pendant home. String, horsehair, paper, strips of soft cedar bark (and in one instance in my own experience a piece of blue ribbon) are most cunningly interwoven and shaped into a pouchlike form. Nearly a fortnight passes before the work is completed to the satisfaction of the little architects and the house ready to receive its mistress. All is ready at last, and "my lady," looking as demure as possible, is soon deep in household cares.

The finished nest is a light, graceful structure, swaying responsive to every breath that stirs, but withal so strong that the fierce gale will only toss it about, without injuring its contents, and often the mother bird will ride out the storm therein in perfect security. So well is it hidden that it often passes unseen, the dark leaves rooting it in completely. The male, however, often betrays its whereabouts with his noisy chatter, as he dashes at some careless bird who has ventured too near. Immediately after you will hear

his metallic *tu-e! tu-e! te-u! tu-e!* as he proclaims to his mate that "all is well." When the little family arrives the joyous parents are busy from early morning until night foraging for food, and they are valuable at this season as most indefatigable insect destroyers. As I have said, the oriole is strictly a tree bird, and rarely seen below. He has often come to the bath, however, yielding to its attractions during the summer heats, and a beautiful sight it is to see him dash the spray from his jetty wings as he washes, his handsome brown eyes rivaling the flying drops in their sparkles. When does he arrive? With the buds and blossoms; when the orchards are covered with flaky blooms, and the locust fills the air with its perfume, then it is you hear him, with his wild voice full of the breezy tree tops and his bright form gleaming like a coal of fire among the leaves. *Tu-e! tu-e! te-u! tu-e!* WILMOT.

NEW YORK CITY.

THE COUESIAN PERIOD.

By R. W. Shufeldt, Capt. Medical Corps, U. S. A., Chairman Section of Avian Anatomy, A. O. U. Continuation of the Historical Preface from advance sheets of Coue's "Key."]

THE POST-LINNÆAN EPOCH: 1758–1800.

(1758—1766.)

THE *Linnæan Period.*—An interregnum here, during which not a notable work or worker appears in North American ornithology itself. But events elsewhere occurred, the reflex action of which upon our theme is simply incalculable, fully requiring the recognition of this period. The dates, 1758-1766, are respectively those of the appearance of the tenth and of the twelfth edition of the "Systema Naturæ" of Linnæus. In the former the illustrious Swede first formally and consistently applied his system of nomenclature to all birds known to him; the latter is his completed system, as it finally left his hands; and from then to now, zoologists, and especially ornithologists, have disputed whether 1758 or 1766 should be taken as the starting point of zoological nomenclature. In ornithology, the matter is still at issue between the American and British schools. However this may result, the fact remains that during this "Linnæan period," 1758 to 1766, we have the origin of all the tenable specific names of those of our birds which were known to Linnæus; the gathering up and methodical digestion and systematic arrangement of all that had gone before. Let this scant decade stand—mute in America, but eloquent in Sweden, and since applauded to the echo of the world.

Nor is this all. The year 1760 saw the famous "Ornithologia" of Mathurin Jacques Brisson (* April 20, 1725—† June 23, 1806) in six portly quartos with 261 folded plates, and elaborate descriptions in Latin and French, of hundreds of birds, a fair proportion of which are North American. Many are described for the first time, though unfortunately not in the binomial nomenclature. The work holds permanent place, and most of the original descriptions of Brisson are among the surest bases of Linnæan species.

(1766-1785.)

The Forsterian Period.—Nearly twenty years have now elapsed with so little incident that two brochures determine the complexion of this period. John Reinhold Forster was a learned and able man, whose connection with North American ornithology is interesting. In 1771 he published a tract, now very scarce and of no consequence whatever, entitled "A Catalogue of the Animals of North America." But it was the first attempt to do anything of the sort—in short, the first thing of its kind. It gives 302 birds, neither described nor even named scientifically. But that was a large number of North American birds to even mention in those days—more than Wilson gave in 1814. Forster followed up this exploit in 1772 with an interesting and valuable account of fifty-eight birds from Hudson's Bay, occupying some fifty pages of the "Philosophical Transactions." Several of these birds were new to science, and were formally named, such as our white-throated sparrow, black-poll warbler, Hudsonian titmouse and Eskimo curlew. Aside from its intrinsic merit, this paper is notable as the first formal treatise exclusively devoted to a collection of North American birds sent abroad. The period is otherwise marked by the publication in 1780 of Fabricius's "Fauna Grœnlandica," in which some fifty birds of Greenland receive attention; and especially by the appearance of a great statesman and one of the Presidents of the United States in the rôle of ornithologist; Thomas Jefferson's "Notes on the State of Virginia" having been first privately printed in Paris in 1782, though the authorized publication was not till 1787. It contains a list of seventy-seven birds of Virginia, fortified with references to Catesby, Linnæus and Brisson as the author's authorities. There were many editions, one dating 1853.

The long publication in France of one of the monumental works on general ornithology coincides very nearly with this period. I refer of course to Buffon and his collaborators. The "Histoire Naturelle des Oiseaux," by Buffon and Montbeillard, dates in its original edition 1770–1783, being in nine quarto volumes, with 264 plain plates. It forms a part of the grand set of volumes dating 1749–1804, in their original editions. With the nine bird volumes are associated the magnificent series of colored plates known as the "Planches Enluminés," published in 42 fascicles, from 1765 to 1781. The plates are 1,008 in number, of which 973 represent birds.

(1785-1791.)

The Pennantian Period.—A great landmark—one of the most conspicuous of the last century—was set up with the appearance in 1785 of the second volume of Thomas Pennant's "Arctic Zoology." The whole work, in three quarto volumes with many plates, 1784–87, was "designed as a sketch of the zoology of North America." In this year, also, John Latham completed the third volume (or sixth part) of his "General Synopsis of Birds." These two great works have much in common, in so far as a more restricted treatise can be compared with a more comprehensive one; and in the history of our subject the names of Latham and Pennant are linked as closely as those of Catesby and Edwards. The parallel may be drawn still further; for neither Pennant nor Latham (up to the date in mention) used binomial names; their species had consequently no standing; but they furnished to Gmelin in 1788 the same bases of formally named species of the thirteenth edition of the "Systema Naturæ," that Catesby and Edwards had afforded Linnæus in 1758 and 1766. Pennant treated upward of 500 nominal species of North American birds. The events at large of this brief but important period were the progress of Latham's Supplement to his Synopsis, the first volume of which appeared in 1787, though the second was not completed till 1801; the appearance in 1790 of Latham's "Index Ornithologicus," in which his birds receive Latin names in due form; and the publication in 1788 of the thirteenth edition of the "Systema Naturæ," as just said.

We are so accustomed to see "Linn." and "Gm." after the names of our longest-known birds that we almost unconsciously acquire the notion that Linnæus and Gmelin were great discoverers or describers of birds in those days. But the men who made North American ornithology what it was during the last century were Catesby, Edwards, Foster, Pennant, Latham and Bartram. For "the illustrious Swede" was in this case little more than a methodical cataloguer, or systematic indexer; while his editor, Gmelin, was merely an industrious, indiscriminate compiler and transcriber. Neither of these men *discovered* anything to speak of.

(1791—1800.)

The Bartramian Period.—William Bartram's figure in the events we are sketching is a notable one—rather more on account of his bearing upon Wilson's subsequent career, than of his own actual achievements. Wilson is often called "the father of American ornithology;" if this designation be apt, then Bartram may be styled its godfather. Few are fully aware how much Wilson owed to Bartram, his "guide, philosopher and friend," who published in 1791 his "Travels through North and South Carolina," containing much ornithological matter that was novel and valuable, including a formal catalogue of the birds of the Eastern United States, in which many species are named as new. I have always contended that those of his names which are identifiable are available, though Bartram frequently lapsed from strict binomial propriety; and the question furnishes a bone of contention to this day. Many birds which Wilson first fully described and figured were really named by Bartram, and several of the latter's designations were simply adopted by Wilson, who, in relation to Bartram, is as the broader and clearer stream to its principal tributary affluent. The notable "Travels," freighted with its unpretending yet almost portentous bird matter, went through several editions and at least two translations; and I consider it the foundation of a distinctively American school of ornithology.

We have seen, in several earlier periods, that men's names appear in pairs, if not also as mates. Thus, Catesby and Edwards; Linnæus and Gmelin; Pennant and Latham; and, perhaps, Buffon and Brisson. The Bartramian *alter ego* is not Wilson, but Barton, whose "Fragments of the Natural History of Pennsylvania," 1799, closed the period, which Bartram had opened, and with it the century also. Benjamin Smith Barton's tract, a folio now very scarce, is doubly a "fragment," being at once a work never finished, and very imperfect as far as it went; but it is one of the most notable special treatises of the last century, and I think the first book published in this country that is entirely devoted to ornithology. But its author's laurels must rest mainly upon this count, for its influence or impression upon the course of events is scarcely to be recognized—is incomparably less than that made by Bartram's "Travels" and his mentorship of Wilson.

By the side of Bartram and Barton stand several lesser figures in the picture of this period. Jeremy Belknap treated the birds of New Hampshire in his "History" of that State (1792). Samuel Williams did like service for those of Vermont in his "History" (1794). Samuel Hearne, a pioneer ornithologist in the northerly part of America, foreshadowed as it were, the much later "Fauna Boreali-Americana" in the narrative of his journey from Hudson's Bay to the Northern Ocean—a stout quarto published in 1795. Here a chapter of fifty pages is devoted to about as many species of birds; and Hearne's observations have a value which "time, the destroyer," has not yet wholly effaced.

THE WILSONIAN EPOCH: 1800-1824.

(1800-1808.)

The Vieillotian Period.—As we round the turn of the century a great work occupies the opening years, before the appearance of Wilson, a work by a foreigner, a Frenchman, almost unknown to or ignored by his contemporaries in America, although he was already the author of several illustrated works on ornithology, when, in 1807, his "Histoire Naturelle des Oiseaux de l'Amerique Septentrionale" was completed in two large folio volumes, containing more than a hundred engraving, with text relating to several hundred species of birds of North America and the West Indies; many of them figured for the first time are entirely new to science. This work, bearing much the same relation to its times that Catesby's and Edwards's respectively did to theirs, is said to have been published in twenty-two parts of six plates each, probably during several years; but the date of its inception I have never been able to ascertain. However this may be, Vieillot alone and completely fills a period of eight years, during which no other notable or even mentionable treatise upon North American birds saw the light. Vieillot's case is an exceptionable one. As the author of numerous splendidly illustrated works, all of which live; of a system of ornithology, most of the generic names contained in which are ingrained in the science; of very extensive encyclopædic work by which hundreds of species of birds receive new technical names; Vieillot has a fame which time rather brightens than obscures. Yet it is to be feared that the world was unkind during his lifetime. At Paris, he stood in the shadow of Cuvier's great name; Temminck assailed him from Holland; while, as to his work upon our birds, many years passed before it was appreciated or in any way adequately recognized. Thus, singularly, so great a work as the "Histoire Naturelle"—one absolutely characteristic of a period—had no appreciable effect upon the course of events till long after the times that saw its birth, when Cassin, Baird and others brought Vieillot into proper perspective. There is so little trace of Vieillot during the Wilsonian and Audubonian epochs, that his "Birds of North America" may almost be said to have slept for half a century. But today, the solitary figure of the Vieillotian period stands out in bold relief.

(1808-1824.)

The Wilsonian Period.—The "Paisley weaver;" "the Scotch pedler;" the "melancholy poet-naturalist;" the "father of American ornithology"—strange indeed are the guises of genius, yet stranger its disguises in the epithets by which we attempt to label and pigeon-hole that thing which has no name but its own, no place but its own. Alexander Wilson had genius, and not much of anything else—very little learning, scarcely any money, not many friends, and a paltry share of "the world's regard" while he lived. But genius brings a message which men must hear, and never tire of hearing; it is the word that comes when the passion that conceives is wedded with the patience that achieves. Wilson was a poet by nature, a naturalist by force of circumstances, an American ornithologist by mere accident—that is if anything can be accidental in the life of a man of genius. As a poet, he missed greatness by those limitations of passion which seem so sad and unaccountable; as the naturalist, he achieved it by the patience that knew no limitation till death interposed.* As between the man and his works, the very touchstone of genius is there; for the man was greater than all his works are. Genius may do that which satisfies all men, but never that which satisfies itself; for its inspiration is infinite and divine, its accomplishment finite and human. Such is the penalty of its possession.

Wilson made, of course, the epoch in which his work appeared, and I cannot restrict the Wilsonian period otherwise than by giving to Vieillot his own. The period of Wilson's actual authorship was brief, it began in September, 1808, when the first volume of the "American Ornithology" appeared, and was cut short by death before the work was finished. Wilson, having been born July 5, 1766, and come to America in 1794, died August 23, 1813, when the seventh volume was finished; the eighth and ninth being completed in 1814 by his friend and editor, George Ord. But from this time to 1824, when Bonaparte began to write, the reigning work was still Wilson's, nothing appearing during these years to alter the complexion of American ornithology appreciably. Wilson's name overshadows nearly the whole epoch—not that others were not then great, but that he was so much greater. This author treated about 280 species, giving faithful descriptions of all, and colored illustrations of most of them. There are numerous editions of his work, of which the principal are Ord's, 1828-9, in three volumes; Jameson's, 1831, in four; Jardine's, 1832, in three, and Brewer's, 1840, in one; all of these, excepting of course the first one, containing Bonaparte's "American Ornithology" and other matter foreign to the original "Wilson." In 1814, just as "Wilson" was finished, appeared the history of the memorable expedition under Lewis and Clarke—an expedition which furnished some material to Wilson himself, as witness Lewis' Woodpecker, Clarke's Crow and the "Louisiana" Tanager; and more to Ord, who contributed to the second edition of "Guthrie's Geography," an article upon ornithology. Ord's prominence in this science, however, rests mainly upon his connection with Wilson's work, as already noted. Near the close of the Wilsonian period, Thomas Say gave us important notices of Western birds, upon the basis of material acquired through Long's expedition to the Rocky Mountains, the account of which appeared in 1823. In this work, Say describes sundry species of birds new to science; but he was rather an entomologist than an ornithologist, and his imprint upon our subject is scarcely to be found outside the volume just named.

A noted—some might say rather notorious—character appears upon the scene during this period, in the person of C. S. Rafinesque, who appears to have been a genius, but one so awry that it is difficult to do aught else than misunderstand him, unless we confess that we scarcely understand him at all. In the elegant vernacular of the present day he would be called a crank; but I presume that term means that kind of genius which fails of interpretation; for an unsuccessful genius is a crank, and a successful crank is a genius. For the rest, the Wilsonian period was marked by great activity in Arctic exploration, in connection with the ornithological results of which appear prominently the names of William E. Leach and Edward Sabine.

As illustrating the relation between Wilson and Bartram, which I have already pointedly mentioned, I may quote a few lines from Ord's "Life of Wilson."*

* "His schoolhouse and residence being but a short distance from Bartram's Botanic Garden, situated on the west bank of the Schuylkill, a sequestered spot, possessing attractions of no ordinary kind; an acquaintance was soon contracted with that venerable naturalist, Mr. William Bartram, which grew into an uncommon friendship, and continued without the least abatement until severed by death. Here it was that Wilson found himself translated, if we may so speak, into a new existence. He had long been a lover of the works of Nature, and had derived more happiness from the contemplation of her simple beauties, than from any other source of gratification. But he had hitherto been a mere novice: he was now about to receive instructions from one whom the experiences of a long life, spent in travel and rural retirement, had rendered qualified to teach. . . . From his youth Wilson had been an observer of the manners of birds; and since his arrival in America he had found them objects of uncommon interest; but he had not yet viewed them with the eye of a naturalist." This was about 1800—rather a little later. Wilson's "novitiate" was the Vieillotian period, almost exactly. Bartram survived until July 22, 1823, his eighty-fourth year; the date of his death thus coinciding very nearly with the close of the Wilsonian epoch and period.

[TO BE CONCLUDED.]

TESTING DEUTERONOMY.—One of the most singular things I ever heard about birds was related to me by a friend who has long been an ardent student of ornithology, and of the Scriptures as well. In the course of his reading he came across a chapter in Deuteronomy which embraces "sundry laws and regulations," and found his attention attracted to the following verses: "If a bird's nest chance to be before thee in any tree or on the ground, whether they be young ones or eggs, and the dam sitting upon the young or upon the eggs, thou shalt not take the dam with the young: But thou shalt in any wise let the dam go and take the young to thee, that it may be well with thee, and that thou mayst prolong thy days." This passage puzzled him a good deal; so, with true scientific ardor, he set out to break its injunction, and try to find out why it was made. It being nesting time for the birds he had no particular difficulty in finding what he sought, and soon returned with a female bird and a nest with four young ones in it, put them all together in a cage, and, after supplying them with food and water, left them for the night. In the morning mother and young were found lying dead together, though without any marks of violence upon them whatever, or anything to indicate why they had died. Evidently something was wrong here, so he went out and caught another family, put the mother in one cage and the young in another, and gave them separate rooms, although not removing them so far apart but that they could hear each other in case one or the other should cry out. The next morning all the birds were found dead as before. Again the student went out, and again came back with a capture, and this time he put the young birds in the garret and the old one in the cellar, but although neither mother nor offspring could hear each others' cries, the coming morning showed the same result. He then went out and captured a nest of birds, but let the mother go, and successfully raised the entire brood. In each case the variety of bird was the same—the rose-breasted grosbeak, which is one of the strongest and easiest to rear of all New England species. The reason of this strange occurrence does not appear, but of one thing my friend is convinced, and that is that Moses was the first agitator for a Society for the Prevention of Cruelty to Animals, and that he knew what he was talking about when he discussed birds.—*Sun.*

THE PHILADELPHIA ZOOLOGICAL SOCIETY has issued its twelfth annual report, which shows the institution to be in a most satisfactory condition. The success of the Zoological Gardens is due in a very large measure to the efficiency of the superintendent, Mr. Arthur Erwin Brown.

ENGLISH AND AMERICAN GUNS.

A BRIEF REVIEW OF MY REVIEWER.

Editor Forest and Stream:

It was my fortune to be absent from home when the FOREST AND STREAM of the 8th inst. came to my office, or I should have taken occasion somewhat earlier to have paid my respects to your correspondent, "Vitus," who has seen proper to indulge in some harsh criticisms upon my article in which I begged to dissent from certain views of Mr. Greener. Ordinarily, I have no disposition to evade a legitimate and decorously-conducted controversy, but I have no taste for that which degenerates into nerveless puerilities or the introduction of matter certainly *aliunde* to the questions involved. "Vitus," instead of contenting himself with a dissent from my opinions in regard to the value of a gun, and expressing that dissent in respectful terms, has evinced his entire ignorance of the courtesies of a newspaper discussion, however much learning he may have, according to his own statements, in regard to the mechanical excellence of a gun and the cost of its construction. According to his own testimony, he is a proficient in these matters, and woe be to him who dares "come betwixt the wind and his nobility."

There was nothing in my letter which called for a large part of his criticisms. Indeed nearly all of his article is entirely irrelevant. I will use no harsher term. He will allow me to say, however, that even after the authoritative expressions of this self-exalted expert, I have the temerity to adhere to every utterance which I made in the letter which he pretends to answer. If I err, it is because I have listened to and believe the statements of persons who ought to be quite as well acquainted with the subject as this boastful gentleman, even though he may be a gunsmith, and may have acquired his skill in the workshops of Europe and America. It may never have occurred to "Vitus" that there are some persons who have an idea as to what constitutes well-executed mechanism who do not follow a mechanical profession, and who are not entirely ignorant of its commercial value, and that there are those who have pursued such calling for many years, who are not, and never could be, clever artisans. But, of course, "Vitus" does not belong to the latter class. He is such a thorough expert that no dissent from his statements can be tolerated.

Certainly, I never said, either in my letter or elsewhere, that American mechanics are incapable of turning out first-class work. Why should "Vitus" have made such a charge? He had no authority for it. I said nothing of the kind, and believe nothing of the kind. I did say that many American gunmakers bought English and Belgian barrels, not entirely finished, and hence at a less rate of duty, used them, and then claimed that their product was American manufacture. Can "Vitus" deny this? With all his vainglory, I think he will not have that temerity. Why do they buy them? Because they are inferior in quality? He will not say that. He admits that the best quality can be had for $75, but insists that the additional cost of completing the gun will run the figures up to at least $250. He says that locks for such barrels are worth $75. He must excuse me if I venture to say that a first-class article can be had for much less—locks which have the plate case-hardened and the tumbler and dogs steel. There is no need of case-hardening them. If the metal is hard enough to yield to a file, it will last a lifetime. I have examined the locks of guns made by Purdey, Westley Richards, Scott, Greener and Tolley, and not one of them had their parts case-hardened. I have seen many inferior ones of English and American manufacture, which had been subjected to the process. It is not an expensive one. I have seen guns by Westley Richards, Scott, Greener and Tolley, whose locks were all made by Stanton & Company. At all events, they were so stamped. "Vitus" need not tell me that the stamp was a forgery. These were four-pin bridle locks, and no American can surpass them in their mechanical excellence. They did not cost $75, for some of the guns were imported at a less cost than $150.

I have seen advertisements of American and English manufacturers, in which they propose to fit extra barrels for half the cost of the gun. Now, if a first-class pair of barrels is worth $75, what is the value of the gun? It was my fortune to have imported, within the last twelve months, a gun made to order by a well-known English manufacturer. He represented the gun to be the very best he could make, and that the barrels were of the finest English Damascus. I have quite as much confidence in his statements as I have in those made by "Vitus," however unpardonable he may regard the offense. The gun had an extra pair of barrels of the same grade as the regular ones, and the charge was $75. It was elaborately engraved, and the cost was far less than "Vitus" alleges as the proper value of a first-class gun.

Some years ago I was in New York, and at the house of Francis Tomes & Son, 206 Maiden Lane. It was before breechloaders were known. The superintendent, H. W. Tomes, stated to me, in answer to an inquiry, that $75 would buy as serviceable a gun as could be made, and when men went beyond that price they were paying for fancy work, which was really worthless, or for the name of some man who charged fabulously for his reputation. Perhaps Tomes knew nothing of the subject, and was one of those "blasted fools" who beget the ire of Vitus. Verily, some men do make themselves "blasted fools," or nature may not have been very lavish of her gifts to them. But, of course, "Vitus" is not one of them. He stands somewhat as Phillips said of Napolean, "A sceptred hermit in the solitude of his own mechanical magnificence."

"Vitus" condescendingly informs "Wells" that there are thousands of English and Belgian guns imported into this country vastly inferior to Colts. If he will pardon me for saying it, I will state that I am not indebted to him for this information. I knew the fact. There are thousands of such, and I would not give one smile of benignant approval from such a man as "Vitus" for a whole cargo of them, even if they are "Hinglish, you know." It was too bad for "Vitus" to have made this ill-tempered fling. If it had been brilliant, I could have admired the scintillation and not noticed the venom. But it was too—I will not say stupid.

But let us get back to the question. How many guns which are well made, and capable of withstanding severe usage, have these high-priced stocks? Of what real value is that beautiful curl in the wood? How much more durable is such a piece of timber? Cannot a stocker finish a neat, strong stock, of tough wood, for less than $20? Cannot American walnut be found which has all the essential qualities? I have thought so, Mr. Greener to the contrary notwithstanding. Why will not $150 buy a gun possessing all the necessary qualities for long use and good shooting? One who has the money, and is so disposed, may invest more heavily; but will not a well-made $150 gun, plain and unadorned, stand all the "wear and tear" of a more highly-priced one? Am I to be regarded as a "blasted fool" for thinking so? If so, then there are American manufacturers who have incurred the "wrath" of this mighty Achilles, "Vitus."

"My offense hath this extent." I chose to allude to the habit of American gun makers buying foreign barrels and then claiming that their product was domestic work. Perhaps I trod upon "Vitus's" corns, and he seeks to wreak his vengeance upon me for simply stating the truth. Do American manufacturers buy English and Belgian barrels? If so, then the statement should not have produced the harsh criticisms.

Permit me to direct "Vitus's" attention to one of his overwhelming arguments (?) in which he details what occurred with regard to the cheap Belgian gun, which was claimed to be a Jo. Manton, the "circumstance" which taught him a "lesson," by which it is clear he derived no profit. "If a man were to bring in a broomstick and say it was the finest gun I ever saw, I would not contradict him." And yet, when I stated that American gunmakers used foreign barrels, this brilliant pupil forgets all he has learned, and "falls a cursing, like a very bawd, a scullion." For shame, "Vitus!" Take a good dose of Simmon's Regulator, and get an amiable digestion.

I trust I am not guilty of the charge which my assailant makes, of hostility to American manufactures. Nothing which I ever said has given a decent pretext for the allegation. It is simply untrue. No man has a higher appreciation of the skill of our mechanics and artisans, or a more exalted respect for that class of our people. My daily pursuits bring me in contact with them, and they have gained my admiration. I belong to a race of mechanics, who take pride in their "coat of arms"—an anvil and a jack plane. But when an American professes to sell a domestic article, I protest it is not just he should finish up the handicraft of a European and palm it off as his own work. If that is a "Hinglish" idea, "Vitus" may make the most of it he can, and get out of it all the consolation it will afford his patriotic soul. He may rest assured that I am one of the unfashionable class who buy guns and watches, not because they are made in England or America, but solely because I think the article is best worth the money which I may invest.

"Vitus" has yet something to learn, preposterous as he may regard the assertion. It would be well for him to entertain the idea that there is at least a possibility that the powers of the Almighty were not exhausted when He brought him into being, and that for wise purposes He made others, who are not entirely destitute of knowledge in relation to mechanism, and that such are entitled to the courtesy of even so exalted a person as my uncharitable critic. At all events it is but due to even the humblest man that his positions upon any subject should be fairly stated, and that a perversion of them, for the sake of triumph, is unworthy of any one who has a decent regard for his own character. WELLS.

ROCKINGHAM, N. C., May 20, 1884.

SNAPPING TURTLES AND SKUNKS.

IN READING of late, the able and interesting work of C. Hart Merriam, M. D., "Mammals of the Adirondacks," we have been reminded of something that may be of use and interest to many readers of FOREST AND STREAM.

Dr. Merriam does not say too much in defense of that much abused animal, the skunk. It is now more than fifteen years since the writer of this article made his first visit to the beach at the mouth of Sandy Creek, Jefferson County, N. Y. No. 1 Life Saving Station now stands on the ground where our party built a shanty of slabs picked up along the beach, and enjoyed boating and fishing for more than a week.

It is just at this place that Sandy Creek, with another stream, finds its way into Lake Ontario. The most northern of these streams runs through Woodville, and the other one, Sandy Creek proper, through the village of Ellisburg. But before either of them find this outlet, they pass through a marsh for the distance of two miles or more. This marsh is well known to many sportsmen of Oswego, Watertown and Syracuse, and many individuals living in the neighborhood are only too well acquainted with it for the good of the game that finds a home there. In days past it was a favorite breeding place for the wood duck (*Aix sponsa*), with some black ones (*Anas obscura*), and any number of coots (*Fulica americana*), grebes (*Podilymbus podiceps*), and rails (*Porzana carolina*). Indeed it is a favorite resort of the wood duck still, but neither they nor any other water bird have much chance to increase there now.

This is a different place from what is known as "Little Sandy Pond" by the sportsmen in the northern part of the State. Little Sandy is three or four miles to the south of the place we are describing. This marsh is sometimes called Pierrepont's Marsh, or Noble's or Gilbert's, or it has other local names around its borders. Little Sandy has for many years been held, we have heard, as a preserve by the Leather Stocking Club of Oswego. But the marsh in question is about six miles long, with it ponds and creeks and brooks, and a mile and a half or more in width. It lies north and south, and on the west is protected from the waves of the lake by a sand beach that extends along its front. Through this beach run two shallow entrances into the marsh, apart from the deeper entrances, where the streams run into the lake at the life-saving station. Schooners enter here and take the North Creek, as it is called, winding up to Woodville, or Sandy Creek, going toward Gilbert's Landing and the village of Ellisburg. Nothing but fishing boats and small yachts could make the other entrances. And these are nearly two miles away, one north and the other south of the station. Of course, through these openings the waters of Lake Ontario flow in or out of the marsh, and fish pass to and fro. The openings are on an average one hundred feet wide, and the heavy west winds blow the waves on shore and raise the waters over the marsh and along the uplands; or on the contrary, an east wind carries them off and the depth decreases in proportion.

The marsh itself is filled with every variety of feeding ground for water birds and waders. Miles of lily pads spread themselves out, white and yellow. There are acres of wild rice, and flags and rushes and sedge in abundance and through all these brooks and creeks, as they are called, and narrow passages. There are ponds bordered with old driftwood, and bog heads and muddy grounds.

The beach is merely a ridge of sand of the finest kind—fifteen feet high in some places—that blows and drifts like snow. We have the best reason, as many others, for remembering this. On our first visit we were surprised to find everything we ate, or attempted to, gritty with sand. The cook for the day was asked whether he had not made a mistake and used sand instead of pepper. Pickerel, perch, bread, butter, everything sandy. And this would happen even when there was the lightest wind blowing, and with the utmost care that we could take to prevent it. And so the sand has gone on blowing on that beach ever since, and long before we knew it, and winds and waters have made many changes. Acres of marsh have been covered within our recollection, and are now converted into a low sand beach over which the breakers wash at times. Great gaps have been hollowed out in the ridge, through some of which the high waves of the lake in spring and fall dash across some three or four hundred feet, and pour their waters by a new way into the marsh. Then the sand has been blown away from the roots of the larger trees that stood on the ridge and they have fallen. The roots now remain, like great sprawling spiders, hanging and projecting from the banks; while the trees themselves have been cut away for fire wood or remain where they fell. In the rear, next the marsh, the alders that grow there are in many places buried to their tops in sand. It is sometimes eight or ten feet deep.

The old residents living near the place can remember when the whole ridge was almost a continuous line of trees. Indeed, we can ourselves, and when from the mainland it was only here and there that you could catch a glimpse of the water near the shore. It is even curious to this day to see pieces of wood and roots of trees five and six feet below the present surface projecting out of the higher banks, proving that for years since the first trees were cut along the shore there had been changes going on and a drifting of the hills toward the marsh since the ridge began to be denuded. In time, no doubt, the hills will be carried inland and help fill up the marsh, while nothing but a low sand beach will be left to attest their past existence.

As we remember this marsh on our first visit, it was filled, as we have implied, with ducks and coots and rails and divers. Indeed, it seemed almost alive with all of these, and we do not know what to compare the quacking and squealing and peeping to, that could be heard there in the early morning. There was no trouble then in securing a game dinner. We have seen hundreds of ducks there the first day of September and earlier, for the 15th of August was the open season then. Black ones, and wood and blue-winged teal, especially in the evenings have we seen these, as they sought the quiet ponds to "roost," while Wilson's, or English snipe, and yellowlegs and plover from time to time would fly past the shanty.

But now all this has changed, and it has been changing for years, so far as our observation goes, while there does not seem very much more hunting than formerly. Last fall revealed a state of things that we were not unprepared for. Every bird about that place, except blackbirds, redwings and marsh hens were in smaller numbers than we had ever seen them; and our annual visit seemed almost devoid of the pleasant surroundings of the past. The grebes that were so tame, because few hunters disturbed them, were nearly all gone; even the frogs and water snakes were in smaller numbers, and these were always so plenty. They would sit upon the shore or curl up upon the logs, or swim across the creek, while the muskrats that whined among the flags, or splashed from the banks, or swam in front of the boat had entirely disappeared; and we could not think that they had all perished by the hand of man.

But now what is the cause of all this change? Not to say that man's hand may not have had something to do with almost the whole of it, but surely not with the grebes and snakes and frogs. We know of no one there that eats frogs.

Well, here, we think, is one reason of this change and this scarcity, and here is the reason for our thinking as we do, let sportsmen and others form their own conclusions: The borders of this marsh and the beach that stands in front of it were, a few years ago, a favorite resort of the skunk. They abounded in the neighborhood and no doubt at times made raids upon the hen coops and the nests that were stolen away. But they did more than this in the way of destroying eggs. And here comes, in another of their uses, which we take the liberty of suggesting to Dr. Merriam. They followed along the beach (we have seen their trails in the sand) and around the borders of the marsh and dug out the snapping turtle's eggs (*Chrysdra serpentina*). We have seen many of the shells of these eggs in little collections of four, five or six drying up in the sun. No doubt there were a few minks that helped them in this work. But the mink fur passed out of fashion and the skunk fur came in, and hence there was a price offered for their pelts. And very many men and boys went to catching them. We have a friend, F. M. Noble, living near the marsh, a buyer of furs, who bought hundreds of their skins. He told the writer that he stored them in his woodhouse, and that the place smelt so of skunk that he could hardly eat in his kitchen for nearly a year.

And now the result of all this. The snappers have taken possession of the marsh, they and their congeners the *Chrysomys picta* (of a smaller size, and perhaps only less destructive because they are fewer in number), and there is nothing to keep down their increase. The beach is one of their favorite places of resort to lay their eggs in the warm sand. We say one of their favorite places, for we have seen the shells of their eggs, where the skunks and minks have dug them out, all around the marsh we might say, wherever there was a dry knoll or sandy hillock. But the beach is their favorite resort, and after a warm sun in June, it is covered with tracks where they have gone up and came down, while in August and before it hundreds of little ones may be seen crawling along the sand, and leaving a double line as they make their way toward the marsh.

There are few skunks and fewer minks around that place now left to destroy the eggs. Hence the increase of the snappers. Indeed they have the marsh, as we have said, almost to themselves, and everything that crawls, creeps, or swims about it is exposed to their depredations. This is the reason that those living in the neighborhood—friends of the game laws, too—speak of the large numbers of wood ducks that are seen in the early summer, and with their young, and then the few that seem to be around when September comes in, and this number seems to be decreasing, and only confirms what we have witnessed ourselves on this same marsh not many years ago. I will give it as it occurred.

It was during the early part of August that I was there for my health with a nephew. We were trolling for pickeral in the North Creek, he at the oars and I with the line. We had gone up some distance when I observed a coot with a single young one more than half grown, swimming across the stream, about two hundred yards ahead of us. As my nephew was a city lad and unacquainted with the marsh, I

first called his attention to the birds, and then asked him if he would like to see them nearer. He replied that he would, and I at once drew in my line and told him to seat himself in the bow of the boat. I then took the paddles and commenced urging the skiff forward as quietly as possible. The birds meanwhile had crossed the creek and gone in among some lily pads and tufts of wild rice that grew close to the edge of the stream. We had hardly entered these when up went the old bird, but no young one started, and I knew that it was fully fledged. This rather surprised me, and I told my nephew to stand up, look carefully, and he would see it swimming and hiding in the rice that was around us. But no, no bird was there. I was about to stand up myself and see if I could not discover it, for the place was comparatively open, when all at once Frank turned around, with something of terror depicted upon his countenance, and exclaimed, "Oh! what an enormous bullfrog, and he has the bird in its mouth." Knowing that he had mistaken a large snapping turtle for a frog, I told him to take the oar and strike it. He did so, or attempted to, when up came the young bird. It was warm and the blood was running from its side. I found no marks on its feet as though they had been bitten, but a great mouthful had been taken from the side of the bird and the entrails were hanging out.

The only way now that we can see of increasing the game on that marsh or any of those bordering the lake, if the skunks must be destroyed, is to watch the snappers and their congeners in June, when they go up the bank to lay their eggs, and destroy them; while many of the males might perhaps be shot as they sun themselves on the logs. But we do not think the snapping turtle is as much given to this as his companion. However, this is thrown out as a hint to those who have preserves and wish to increase the number of game birds. We have known many young ducks, and even some pretty well grown, to be taken away by snappers. And this even in ponds in close proximity to the house. A friend had to let his pond off last summer before he could catch the turtle that destroyed many of his young ducks. No doubt dogs and minks are often blamed for doing something that belongs to a creature of a very different nature. Farmers had best watch the ponds and brooks where their ducks and goslings feed if they miss them. A. H. G.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

I have read in a recent issue of your paper the courteous reply of "C. D." to my criticism of certain repeating rifles. The defense is an earnest one and commands the respect always due to sincerity, yet I cannot see that the reasoning of your Wyoming correspondent invalidates at any point the position which I have taken. "C. D." pleads for the repeater, and instances cases where it has been useful; but he does not show that accidents do not occur with it, nor that it can be relied upon to do its work unfailingly. The tests which he quotes are certainly very interesting, but I observe that in these tests there was a failure to extract a shell, *i. e.*, the gun did not work, a breakdown, and an explosion in the magazine. These are the things that I do not wish to have happen with the gun I am using. Of course I do not pretend to say that such occurrences take place often, but I do say that they may take place at any time, and that I prefer a gun not liable to such mishaps.

"C. D.'s" critical reply covers a good deal of ground, and to answer it in detail would occupy more time than I can give to the task. I hope, therefore, that he will pardon me if I confine myself to the original proposition as stated in the letter to which he takes exception, and to one or two other matters more personal in their nature. Of these last let me speak first.

I must apologize to my critic for giving a false impression as to the arm which caused the Jim Baker accident. I supposed, from the connection in which the incident was given in the letter quoted, that it was a Henry (or Winchester) rifle, but, as "C. D." had his account from the old man himself, it is evident that my idea of the occurrence was an erroneous one. I certainly had no intention to mislead.

It is clear that I must have expressed myself unfortunately as to the care which, I think, should be given a gun, and so have been misunderstood by "C. D." I believe that a man should keep his gun in good order, but I do not think that one who, for whatever cause, fails to do this, should lose his life for this failure. The penalty is rather too severe, you see, for what may be nothing more than a little carelessness, or may be quite unavoidable. "C. D." implies that I criticized all repeaters as to their reliability of action and safety. My impression is that a second reading of my letter will convince him that I did no such thing, but that I expressed the opinion that those repeaters which have the magazines in a tube beneath the barrel or within the stock are unreliable and unsafe. Of the former there are a number of forms, all acting on substantially the same principle, all, I believe, likely to get out of order on small provocation, and all liable to premature discharge within the magazine from a number of causes. The Winchester gun is spoken of by those who write on the subject, because it is the oldest of these repeaters, and the one from which all subsequent inventors appear to have drawn their ideas. The most recent rifles of this model have not yet been practically tested in the hands of the public, and when any single individual says that some particular form is the best repeater in the market, is perfectly safe, and will not get out of order, the public naturally waits, before approving or disapproving, to take more testimony on the subject. The dictum of one man is not enough. These arms are new and untried. They have yet to make a record for themselves. I hope that "C. D." will pardon me if I say, moreover, that in some of his recently published writings he has shown a very strong bias in favor of one particular arm, and that, therefore, his opinion, however honest, may not be quite free from prejudice.

In my previous letter I attempted to show that with the repeater the chance of serious danger to the hunter is vastly greater than with the singleloader. I do not pretend to assert that cartridges often explode in the magazine. On the contrary; I think that this occurs very seldom, but then it may occur at any time, and this possibility is somewhat alarming. Two cases of this kind already cited occurred in the hands of men with whom I had close relations.

"C. D.'s" criticism of men who should not be trusted with guns is just enough. But then he must remember that to err is human. If no one ever did a foolish or a careless thing we should have very few accidents with guns. As he very justly says, there is "some preventable cause for each accident," but, as guns go into the hands of wise men and fools alike, we must try to save the lives of as many of the fools as possible by making the guns as safe as possible, and so reducing the danger, from whatever cause, to a minimum.

The man who uses a repeater exposes himself to many dangers not undergone by him who uses the singleloader. If he is willing to take these risks that is his affair.

It is just because a man in the western country must sometimes take his life in his hands that a gun is required that will always work. And this is not true of the Winchester of to-day, nor do I believe it true of other repeaters working on the same plan. I cannot positively assert that all of the various models built on the Winchester plan will get out of order, because, as "C. D." suggests, I have not tried them all. But, admitting this failing in the Winchester of latest model, the inference that the other arms built on a similar plan will act, or fail to act, in the same way, is not an unfair one. I instanced the case of "many years ago," because it was the first time that I had seen much of the repeater, but I think that "C. D." must very well know that at the present day, notwithstanding the march of improvement for "three hundred years," it is an extremely common thing for a cartridge or shell to stick in a tube repeater. This is the testimony of so large a number of practical hunters, whose word would be unhesitatingly taken in other matters, that we cannot doubt that it is a fact. In a country where a man's life may depend on the readiness with which he can use his gun, an arm can have no fault more serious than this.

And now, although I have already written more than I had intended, let me touch on one or two additional points brought up by "C. D." He appeals for rifles that are more accurate. In this appeal I unite, though I cannot but think that for practical purposes any one of half a dozen rifles now on the market is quite good enough. The proposition that to do good shooting we must have good rifles, seems certainly rather elementary. He complains in the last part of his letter that the errors of the man should be charged to the rifle, but he does not appear, in his expressed desire for rifles that will always hit the mark, to remember that, after all, this hitting depends on the man vastly more than on the rifle. No intelligent and observant person can use a rifle much without learning its peculiarities, and after he has acquired this knowledge he can scarcely fail to do with the arm work that is reasonably good. This on the supposition that he is a decent shot, and that the arm is bored true and shoots alike every time. No man, however, can account for the shooting of a tube repeater, the balance of which is constantly changing. If it be supposed that each time a man goes hunting he is to carry a rifle with which he is entirely unacquainted, we could understand how it is that there should be so much anxiety about the accuracy of these rifles, but the rifles of to-day are practically accurate, and an individual may learn by firing at different ranges at a target all he needs to know about his gun; and as soon as a man knows how his gun shoots, the fault if he misses lies in him and not in the weapon. "C. D.," however, appears to assume a man who is infallible, and takes it for granted that a failure to place a ball in the spot aimed at is due to some fault in the rifle he is shooting. That is the way his article reads, but of course I cannot suppose he intended to give utterance to any such absurdity.

He says further, "It is a lucky chance if the hunter can come on his game at a known distance or have full time to estimate it." I grant that it is unusual to come on the game at a known distance, but dissent utterly from the latter part of his proposition. A man who is hunting will often—even usually—see his game before it sees him, and will have abundant time to estimate his distance before shooting. Of course, if one merely rides over the country, taking his chance of stumbling on game, things will be as "C. D." says, but I am speaking of men who hunt, not men who blunder. And suppose the game is found to-day at 50 yards and to-morrow at 150, the hunter who knows his arm should be able to make the necessary allowances for the difference. To judge the distance and shoot accordingly is about as important as any part of the work a hunter has to do.

I hold that the repeater is a cruel weapon, because the knowledge that a man has a dozen shots in reserve, makes him careless in his shooting, and leads him to continue it too long. "C. D." theorizes about an ideal sportsman, but we must reason about the average man. Probably neither "C. D." nor I would continue to shoot, if we carried repeaters, longer than was advisable, but the young hands, the men who are hunting big game for the first time, will try to kill as long as they can. The men who butcher, who wound five head of game for one that they kill, are, so far as I have had the misfortune to be thrown with them, those who are so crazy to kill game that nothing can restrain them; they will shoot as long as the animals are in sight. The man who hunts for his needs knows enough to take his time and to avail himself of every advantage. He gets as close as he can, and the single ball from his rifle does the work. Even a cool headed man, unless he is accustomed to the sight of game, will fire ten shots from a repeater where he would use a singleloader but once. Thus the repeater is a constant temptation.

I am unable to see that the article to which this is a reply is other than a virtual admission of all that I have advanced against this dangerous arm. I believe that other things being equal, the best gun is the safest—safest in action, I mean, and in being always ready for use, and, as I have said before, I do not believe that the repeater with the magazine in the tube under the barrel or within the stock, fulfills these conditions.

My time is so occupied that I cannot give much of it to writing, and I only reply now to "C. D." to show him that I do not consider his arguments good ones, or that he has in any way replied satisfactorily to the points I tried to make. G.

Editor Forest and Stream:

I have owned and used rifles of large and small bores, and have at last settled down to the .32-caliber, short and extra long cartridges, for general hunting and target shooting.

I believe that accuracy is of more importance than weight of powder and lead. If one knows that he can place a ball in some vital part of the game he is hunting, he is pretty certain of making a mortal wound. There is little or no recoil to the .32-caliber to affect the aim, as in all large bores. Of course for grrizzlies, buffalo and moose, a large bore is necessary. But I am speaking now of common hunting, deer, turkey, geese, etc. Probably the .38-caliber would be better still where no small game is hunted.

I am now using a little .32-caliber, and find no difficulty in killing whatever I aim at. I have killed several alligators with it lately—all at one shot. The last one was eight feet in length, the ball (.32 short) entered at one eye, passed through the head, and carried away a large piece of bone near the other, disabling the 'gator so bad that, after he had stopped lashing the water with his tail, I drew him out on the land without resistance on his part. The alligator is like a snake in that it lives long after it has been mortally wounded or has its head cut off. It is pretty well known that a good sized alligator is hard to kill; that in order to kill one at all (outright, or so you can capture it), the ball must be sent into the eye or just back of the foreleg. I know, nine times out of ten, where my leaden messenger will strike, and as I never attempt to kill game at distances over one hundred yards, (and that is further than most game is killed), I am pretty sure of making a mortal wound.

Try the .32 and .38-caliber rifles, (save ammunition and sore shoulders), and you will become crack shots, and bag more game, in fact have more real sport than you could with your 115 to 120 grains of powder and 350 grains of lead.

RED WING.

GLENCOE, Fla.

Editor Forest and Stream:

At last in looking over your articles on "The Choice of Hunting Rifles," I have found a man after my own heart in your correspondent "E. T. D." The case he cites in regard to the Winchester, is almost invariably the way I have found it. The majority shoot away, thinking they are bound to hit something in ten or fifteen shots, when generally the opposite is the case. I have seen so many "tenderfeet" with their repeaters, pump away (excuse the word pump but it is very expressive) at a deer, within easy shooting distance, and that deer was as safe as if he were 100 miles away. You do not, as a rule, find old Rocky Mountain hunters, who face the fiercest animals, use a repeater, they trust to shooting straight, not to the number of shots. I have had considerable experience with the rifle, in shooting such large game as bear, mountain lion, elk, deer, antelope, etc, and after giving the repeaters a fair trial, have thrown them all aside and swear by my Sharps hammerless, .40-70-330, and would far rather be face to face with a "silver tip" with my .40-70, than with twenty Winchesters or any other make of repeaters. I anticipate a two months' trip this summer, and if "E. T. D." will come out here, I will guarantee to show him all the bear, deer, elk, etc., he could desire, and moreover as fine trout fishing as the most fastidious would ask for. I say with him, "I want no better gun than the .40 70." SPORT.

CRESTED BUTTE, Colo.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I don't care for "style" in a gun, provided the gun is safe, handles well, and is a close, hard shooter. No matter how strong the material, I want some weight of metal in the barrel of my shotgun and especially at the muzzle of a choke-bore. I believe that where a gun is choked at the muzzle, if it is light at that point it springs so that we do not get the full benefit of the choke. I came to this conclusion by putting a light band of lead, fitting closely, around the muzzle, and after firing the gun I found it would drop off easily, having expanded quite perceptibly.

I have been using for the past two years one of the American Arms Co.'s semi-hammerless single guns, a 12-gauge gun, 28 inches, 9¾ pounds, made to order (a 12-gauge on a 10-gauge stock), cut off and rechoked to leave it heavy at the muzzle. PEDAGOG.

CLEVELAND, O.

Editor Forest and Stream:

Several of your correspondents have made statements that I kill geese at 100 yards with No. 10 shot. It is not so. I have seen pinnated grouse killed at that distance, and I have seen geese killed with Nos. 8 and 10 after being shot at with largest size drop shot. A good 10-gauge gun bored for Kynoch's cases will kill a goose at 100 yards with shot from BBB to TT in size, and it is my opinion it is better to hit a goose at long range with small shot than miss it with large. I have killed geese and turkeys when hunting quail at long range with small shot; longer range than I ever killed a quail under same circumstances. Small shot loaded with good powder, good wads and held right will kill a long way. I have never owned a fine gun yet that I had made for long range but what would stick No. 8 shot in a pine board at 100 yards and stick it in good. Any Baker gun 10-gauge, 32-inch barrels, full choke, will do it, and put TT clear through an inch soft board. Remember to use the very best powder and felt wads. Field loading for wildfowl, say 4½ drams of No. 6 C. & H. powder, one cardboard, one ⅝ felt, one pink-edge, 1¼ ounces of Tatham's TT shot, 3-inch brass cases. If American guns are not fine enough for "Byrne," order from England, and you will get as long range, but not a bit longer. You cannot get such shooting from guns chucked out on a machine so many a day, but from a maker who prides himself on a long-range gun. "Almo's" experience extends over three continents and twenty-five years' shooting, in season; and when I stated that a goose was killed away up yonder by a boy with a $25 gun loaded with No. 10s for quail, I did not intend it as my mode of loading. I still say if you want a dead goose it is better to hit it with No. 8 than miss it with TT. ALMO.

TEXAS.

Editor Forest and Stream:

There has been but little allusion to the great importance of having a gun that will throw shot centrally with a good degree of uniformity. It has been my experience that any gun that will throw a given number of pellets to the center will always distribute the rest of the charge in regular manner. How very few cylinder barrels can be depended upon to do this beyond forty yards. For years I shot a cylinder as good as any for the above distance, but how "wild" it would shoot much of the time, after getting a little foul especially. In spite of my prejudices in favor of my dearly loved old cylinder gun, I was actually forced into the purchase of a "full-choked" breechloader. I had too much evidence crowded unwillingly upon me, so that I had to put by the old gun that had occasionally made such splendid shots and oftener made such decided misses.

I put the manufacturer to a severe test, as I thought. I wanted a gun that would shoot 60 yards with No. 6 shot, and 70 yards with No. 4, with sufficient uniformity to kill a duck or pigeon. Three "full-choked" guns were targeted. Each gun was shot four times. In the record there were from one pellet to five that struck a five-inch bullseye in a thirty-inch circle every time. Only one pellet in one discharge; in all the rest a sufficient number to have struck a duck or partridge. In twelve shots the five-inch bullseye was not neglected once. Such is my idea of what constitutes a good shooting shotgun. I have never yet seen a cylinder that would do that kind of shooting with uniformity. I attribute the difference to the system of "choking." The shot may possibly get tangled up somewhat when they reach the

choke, but they go from 20 to 30 yards further with more directness, and if the gun is properly loaded, the penetration is not materially affected.

Those who hunt ducks have probably found it to be very convenient to have a gun that will carry with uniformity one ounce of heavy shot 60 yards, backed by 4 drams of good powder. This increase of distance is undoubtedly obtained by the wise system of choking that our makers have succeeded in getting, enabling us to reach out after game that grows more wild as it gets more scarce. For wing-shooting in the brush I should not desire a full choke, but would even there like a modified choke. We are often obliged to take long shots at quail and partridge if we get any shots at all. Wire cartriuges in a cylinder do good work, but they are costly luxuries for rapid shooting. One thing more: Let it be proven that English guns excel the make of our home manufactories in the field before we decide in their favor. American mechanics never have been excelled in the long run. They are not now. Europe has had our gun trade long enough. CHOKE-BORE.

THAT STEAM CAT.

Editor Forest and Stream:

It is sad to grow old; to be thrust aside from and be left behind by the struggling, advancing crowd of younger men, to feel the vigor of one's frame passing away, the once firm muscles grown flabby, the bones invaded by rheumatic pains, the lissome joints stiffening with age, the erect form warped, the eye grown dim, the ear dull, the arm nerveless, the grass-hopper become a burden. All these indications of approaching senility are hard for one, first to realize, then to submit to; but it is harder still to become aware that one's mental faculties are failing, and that time is blotting many things from the page of memory, and that already much recorded there has become a blank.

This pang I felt most keenly when I read the communication of your correspondent "G. Whillikens," in a recent issue of FOREST AND STREAM, for many of the things related by his friend Squibob as having happened to him and me have entirely passed out of my recollection. I have no remembrance of anything in relation to the steam cat, nor even of the existence of such an animal, and certainly none whatever of my having taken part in any land battle on this continent. What little fighting that I remember done by me with human foes was with my corps, the Horse Marines, at sea, and I cannot recall the fact that I ever bestrode a "cayute," whatever that may be, though during one cruise, when I was attached to the U. S. frigate Constipation, we were mounted on sea horses. It was the hardest service I ever saw, for we were in the saddle almost constantly, swimming our steeds around the ship, half of us all day and half all night, only going aboard for our rations and sleep.

But it is not my purpose to relate my adventures here, but only to confess how sadly my memory has failed. Ah me! it is indeed sad to grow old, but it is a consolation to me to feel that though bodily and mental faculties are waning, my love of truth is as strong as ever, and to know that I have not lost, as some appear to have done, with youth and vigor, my capacity for telling it.

Yours for the truth,

ADIRONDA, May 14. MAJOR JOSEPH VERITY, U.S.H.M.

MIDNIGHT MELODY.

THERE appears to be something peculiar in the geographical situation of this city that attracts migratory birds in passing over. On several occasions of late years vast numbers of plover have been heard calling as they went over the city on their autumnal migration, and before the wild pigeons had been reduced in numbers to the present proportions they were seen in this vicinity whenever they entered the State at all. There has not been a noteworthy flight of pigeons here within fifteen years, but plover, ducks and geese continue to show themselves about the time they are changing their habitation.

On the night of Thursday, May 22, the midnight sky was vocal with what seemed to be the whistling of innumerable birds of the plover species, perhaps they were what you people along the sea coast call bay snipe. They were not gray plover, for its call is so peculiar that I never fail to recognize it. The night was dark and a little rain was falling, so that no one could see the birds, although they sometimes flew so low, to judge from the clearness of their twitterings, that they must have been within gunshot. Again they would be heard so faintly as to indicate that they were a thousand feet above. They seemed to be moving from the east to the west, and the variety of cries led to the belief that all of the birds were not of the same kind or size. The prevailing call sounded to my ear very like the soft whistle of widgeon as they hover over decoys. E. REDMOND.

ROCHESTER, N. Y., May 24.

TWO-EYED SHOOTING.

Editor Forest and Stream:

As my article on "Two-Eyed Shooting" was written for the purpose of assisting beginners and others in the art (for it is an acquired power) of shooting, in justice to myself and those for whom the benefit was intended and through courtesy, I ought not to leave unanswered the kind criticism of your gentlemanly correspondent, "D. W. C.," in your issue of May 15. Before proceeding to discuss his strictures, I must disclaim any desire to "induce others to admire my gun," etc., as set forth in his preamble, as reference to my article will show that "a gun that fits is the only gun alluded to," and as to "my holding" that was the subject matter and I am excusable. Now, as to the main points of his ("D. W. C.'s") objection, I will, to make it clear (without giving in full "D. W. C.'s" communication) quote only points of variance, to wit: "Now, if his advice to hold the gun still about two seconds before shooting only applied to duck sitting on water or any bird not in motion, no doubt he is correct," etc. To which I reply that the aim by my method is equally true at moving objects as at stationary objects. The rule holds good that if the aim of the gun by this method is true in one instance it will be in another. I tried in my first communication to make it appear that the eyes directed the movement of the gun—by what scientific process I am unable to say.

If that point is conceded (which "D. W. C." does concede by saying "if applied to duck sitting on water or birds not in motion, he is correct"), does it not follow that the gun will change as the eye changes from one point to another? In cross shots, as with shooting with one eye shut, allowance must be made for distance and speed of bird and sight taken accordingly, but how much better can it be done with object within line of vision with both eyes open than with one eye shut, losing entire sight of object and making the holding all guess work. To quote further, he says: "Where would the bird be by the time the two seconds interval had expired? Evidently 70 to 100 yards away."

As to rapid flights of birds I have no data to compare with "D. W. C.'s" figures, nor do I think it necessary. It must be remembered that a bird's initial velocity does not compare with the rifle ball, if he does have more "staying power," therefore "D. W. C.'s" extreme speed does not apply to a bird taking wing. I will admit that when game flushes at 40 yards away (and as I am not a 100-yard gunman) two seconds may be fatal to success, but is it certain that he who shuts one eye, can aim quicker? But when birds (as with us) rise from 3 feet to 20 yards, I find no difficulty with my gun (excuse allusion to it), barrels 24 inches long 2¾ drams powder and ⅞ of an ounce of No. 8 shot, in stopping them.

"D. W. C." will admit that there are potterers at all things they undertake; aiming a gun is not an exception, and notably so is a hunting friend of mine, and he will bear me out, that I scold him for being slow in the one only thing he ought to be quick. Nevertheless, with this pottering in aiming, when he has no intervening object, in a clear field, with his 1, 2, 3 and 4 seconds, he makes his bag, when it comes to the bush, with the manner *à la* prince and generosity unequalled, remains a spectator, with the remark, "My friend, you have need of both eyes, perhaps three." I practice what I preach, and at risk of being thought a braggart, I will state that I am considered a good shot and it is known to all of my hunting companions that I shoot no other way. With kindest regards and esteem for "D. W. C." SPORTSMAN.

COLUMBUS, Ga.

DEER FLOATING INCIDENTS.

WHILE reading the articles on "Deer in the Adirondacks" in your paper, I was reminded of two anecdotes, which George Sweeny was accustomed to relate whenever the conversation turned to "night hunting" or "floating" for deer. Probably all sportsmen who have entered the Adirondacks by way of the Lower Saranac have seen or heard of George Sweeny, one of the best and most trustworthy of Adirondack guides, one much sought after by sportsmen on account of his steady habits and general excellence and also a member of that seemingly exhaustless family of the name of Sweeny. (One rarely fails to find a Sweeny or a Moody in any part of the Saranac or St. Regis country.)

At one time, in years gone by, George was in camp at the head of Big Tuppers' Lake and was guiding a gentleman from Ireland, who was in this country in pursuit of sport. Being out of venison it was suggested that George and his sportsman should paddle up Hog River and endeavor to secure that valuable article. As soon as it was dark they started and on their way to the carry by the falls George spent the time in instructing Mr. Sportsman into the *modus operandi* to be pursued. He told him that if they had the good luck to see a deer, to keep perfectly still, and not to shoot until he whispered to him to do so.

Up the river they silently paddled until, as they came around a bend, George discovered a nice buck standing in the water some distance ahead. With strong silent strokes of the paddle George sent the boat along until he thought the proper time, when he whispered "shoot." The man in the bow never stirred. George whispered again a little louder "shoot," but no response from the bow of the boat. In a state of excitement, George whispers in as loud a tone as he dares, "shoot, shoot quick." He has hardly finished when Mr. Sportsman from Ireland turns about so as to face him and exclaims in a loud voice and with a brogue betraying his nationality, "Would I take him now?" It is needless to state the result.

At another time George was one of the guides in the —— party from Yonkers, and one evening took the youngest member of the party out in order to give him his first lesson in "night hunting," and cautioned him to keep perfectly still, whatever he saw. As they were slowly floating along a deer came in sight and the instant the boy saw it he jumped up shouting, "George, I see a deer, I see a deer."

So he did, but that was all. AMPERSAND.

THE MASSACHUSETTS BILL.

Editor Forest and Stream:

Knowing something about the defeat of the proposed game law of Massachusetts, I would like to record some facts concerning it that do not seem to be generally known. The bill passed the Senate without opposition, and it would have gone through the House in the same way had it been a proper bill, intended for the best interests of sportsmen. The House luckily contains a sportsman or two, and their attention was drawn to several very objectionable clauses, that prohibiting the shooting of sea birds in inland waters being most important, in which case the very best autumn gunning on the Massachusetts coast would be entirely prevented. This clause of itself merits the defeat of the bill. The closed season for black duck shooting begins just as these birds arrive on the coast. Other closed dates were very objectionable.

In addition to these were the portions which referred to collecting song birds. Under this clause no person could get an ornithologist's certificate until over twenty-one years of age. I know a number of young men who would be very much injured by such legislation, provided it was executed. As this part of the game law never has been enforced there is little reason to hope that it would have been this year. Indeed, legislation in regard to song birds is and always has been in this State a mere farce. It is a poor way to begin to strengthen them by prosecuting young men interested in ornithology, while the fields are filled with wanton bird killers. More care should be exercised in giving out certificates, and each person ought to be obliged to furnish some proof that he is interested in the birds' welfare. As the Massachusetts law stood it was entirely unfit to pass. Until a game law suitable in all respects is framed for the interest of sportsmen, naturalists and the public, I for one hope that all in the meantime will be defeated. The talk about members of the House being bribed by theater tickets, cigars, etc., is, I think, based entirely upon theory. As for the person who started the opposition and was most instrumental in killing it, I can say that he is an ardent sportsman, who has brought more than one violator of the game law to punishment, and would be the last person to accept a bribe for killing a bill, especially one relating to game. R. T.

Editor Forest and Stream:

Our proposed game law fell through. Generally good, it yet was faulty. While it cut off spring snipe, which is the best time about here to get them, it prolonged the open season on fowl, perhaps to give some gentlemen who visit Cape Cod a better chance at brant. Then again it made the close season on shore birds up to Aug. 1. I have known good shooting on robin snipe by July 13, and for jack curlew, the most of them go along in July. Then the uplands leave on the first good frost. Two weeks in July are worth considerable. I have said nothing about peeps and ringnecks, but they help out a mess, small as they are. Finally, it seems to me that when the birds commence to return from the north it is time to shoot. Whether it be July 1 or any other time, when they come back the fall flight has of course begun.

Males generally come first, then the females, and finally the young of the year as they become strong enough to perform the migration. The trouble is we have too much law now, but not enough enforcement. Sometimes it seems to me as if the so-called pot-hunter got more than his share of blame. Just as long as the *genus homo* endures, there will be those who, to satisfy their appetites, will pay almost any price (in or out of season) for birds or other game. Two wrongs will not make a right, but I do say that a shot at the class I have just mentioned, is one delivered at a fair target, and a very important factor. Boston market is a great dumphole. I admit that and truly hope to see a change.

Sportsmen who want more stringent laws and proper enforcement must dig down deeper into their pockets and fight harder, I mean more substantially, or they will lose the race against marketmen and gourmands four times out of five.

X. Y. Z.

SALEM, Mass., May 3.

THE NEW YORK LAW.

IN answer to a correspondent the other day we quoted the following sections of the Game law:

Section 10. Any person who shall knowingly trespass upon cultivated or inclosed lands for the purpose of shooting or hunting any game protected by this act, or shall take any fish from private ponds or streams not stocked in whole or in part by the State, or after public notice has been given by the owner thereof as provided in the following section shall be liable to such owner or occupation, in addition to the actual damages sustained, in exemplary damages to an amount not exceeding $25.

Section 17. The notice referred to in the preceding section shall be given by erecting sign boards, at least one foot square, upon every fifty acres of land upon the limits thereof, or upon the shores or bank of any lake, stream, or pond, in at least two conspicuous places on the premises; such notice to have appended thereto the name of the owner or occupant, and any person who shall tear down or in any way deface or injure such sign board, shall be liable to a penalty of $25.

The Monte Fredy Fishing Club requests us to print also sections 27 and 28, which read:

Section 27. Any owner or owners, or lessee or lessees, of lands or lands and water, whether such owner or owners, lessee or lessees, be an individual or individuals, association or associations, society or societies, corporation or corporations, desiring to lay out, devote or dedicate such lands or lands and water, for the purpose of a private park or territory, for propagating or protecting fish, birds, and game, shall publish at least once a week for three months, in a paper of general circulation, printed in the county or counties within which such lands or lands and water are located, describing the same. There shall be inserted in said notice, a clause declaring that such lands or lands and water will be used as a private park for the purpose aforesaid. It shall be the duty of such owner or owner, lessee or lessees, at any time during the publication of said notice, or within six months after the final publication thereof, to post up or put up notices or sign boards, warning all persons against trespassing thereon, such notices or sign boards to be not less than one foot square and placed not more than forty rods apart along the entire boundary of said territory, when said premises shall consist entirely of land, and when the same shall consist of both land and water, the said notices shall be placed in conspicuous places upon said territory, so there shall be at least one notice or sign board so placed or erected for every one hundred acres of said territory. When the property to be protected shall consist of a lake or pond only, said notices shall be placed in at least four conspicuous places upon the shore of such lake or pond. When the premises shall be inclosed by a fence or fences of reasonable capacity for protecting said premises, then notices or signboards of the dimensions aforesaid shall be placed on said fence or fences not more than one-half mile apart. After such territory shall be dedicated and designated, all fish, birds, and game, of, in, or upon the same shall be the property of the owners or lessees thereof. [As amended May 31, 1880, chap. 531.

Section 28. After such grounds are inclosed in such manner as to render such fish or game private property, no person shall catch or take from, or kill, any fish, birds, or game, in or upon said grounds or waters, or put on such grounds or in such waters, any poisonous or other deleterious substance, or pisciverous fish, or let off the waters from said grounds, with intent to take fish, or to destroy the fish or eggs placed in such waters, or deface or destroy any sign or notice posted or put up as aforesaid; or place any object against or near such fence or inclosure, with intent to aid dogs or other animals to get into said grounds, or to enable animals kept therein to escape therefrom, or enter upon such grounds with the implements or weapons for catching, taking, or killing fish, birds, or game thereon. Any person found guilty of any offense against this section shall be liable to the owner or lessee, in addition to the actual damages incurred, in exemplary damages to the amount of $25.

The club correspondent adds: "The first trout stream in Onondaga county that has been leased we have possession of. We have stocked and will continue to stock it. Our lease is for twenty years, absolute title. We have complied with the law all the way through and trespassers or poachers will have to take their chances. The first man we catch fishing on our stream will get the full penalty of the law if it costs $1,000."

The section relating to the power of supervisors has been amended to read as follows:

Section 37. It shall be lawful for the board of supervisors of any county, at their annual meeting, to make any regulations or ordinances protecting other birds, fish or game than those mentioned in this act, and also for the further protection of such birds, fish or game as are in this act mentioned, except wild deer, and to this end to prohibit hunting and fishing in particular localities or waters lying within their respective counties, for limited periods and during certain months of the year, and to prescribe punishments and penalties for the violation thereof, and adopt all necessary measures for the enforcement of such punishment and the collection of such penalties. And such regulations and ordinances shall be published in the papers in such county in which the session laws are published; and a certified copy thereof shall be filed in the office of the clerk of the county: provided, however, that nothing herein contained shall be construed as conferring upon the board of supervisors of any county the right or authority to prohibit the owner or owners, in whole or in part, of lands and waters wholly private, or the lessee or lessees thereof, whether such owner or owners, lessee or lessees be an individual or individuals, association or associations, society or societies, corporation or corporations, from angling and taking fish in a lawful manner during the months now allowed by the laws of this State. This act is intended to apply only to such owner or owners, in whole or in part, of lands and waters, or the lessee or lessees thereof, who shall have complied with the provisions of section twenty-seven of said chapter five hundred and thirty-four of the laws of eighteen hundred and seventy-nine, and the acts amendatory thereof.

DOMESTICATING WILDFOWL.—Since the loss of the flock of wood ducks recorded in our columns, Mr. Fred Mather has received, at his place at Cold Spring Harbor, L. I., the following birds, some of which are already mated: One pair of Mandarin ducks or Chinese teal (*Aix galericulata*), four pairs of American wood ducks or summer ducks (*Aix sponsa*), two pairs European widgeon (*Marica penelope*), one pair of European pintail ducks (*Dafila acuta*), and one male green-winged teal (*Querquedula crecca*). The effort to breed our beautiful wildfowl in captivity will be made, and many additions to the list are desired.

THE TRAPPER'S SILENT FRIEND.—Olympia, W. T., May 10.—*Editor Forest and Stream:* Your valuable paper has been the sportsman's friend and the medium of exchange of valuable ideas, the result of the practical experience of scientific sportsmen, and the liberal manner in which these ideas have been given to the public has, in reality, laid the foundation for many of the useful inventions in connection with the rod and gun, and various other articles belonging to the sportsman's catalogue. Perhaps by the same method improvements can be made on the trapper's silent friend, the steel trap. At least information and queries may be exchanged, that will prove of interest to more than one. I notice a growing inclination on the part of the modern trapper and hunter, to catch his fur scientifically and to keep up with the times, and I can show you the files of the FOREST AND STREAM in almost every trapper and hunter's camp west of the Cascade range of mountains in W. T., where a post-office is accessible. The principal fault that various trappers find with the steel trap of to-day is that the catch that works over the jaw of the trap has a tendency to throw the animal's foot away from the trap when sprung, at most catching it by one toe, thus allowing it to twist out. This loses at least twenty-five per cent. of valuable fur. I have reference to beaver and otter. Perhaps some trapper will say, "You should set your trap so as to drown your beaver or otter." In anticipation of such advice I will say that on a lake or river, or where you have plenty of water to drown the animal, that would be correct, but in the shallow brushy swamps that you find west of the Cascade Mountains in this Territory, one does not always have a choice, and even where there is sufficient water the animal is liable to cling to the brush or shore and twist out. Give us an improvement on the steel trap. What think ye?—TILLICUM.

SHORE BIRD MOVEMENTS.—Philadelphia, May 24.—The expected black-breasted plovers, robin snipe, curlews and dowitchers appeared on the New Jersey coast on their way north on Monday, the 19th inst., in small numbers. My last week's communication reached you simultaneously with their arrival and the birds will have passed on before you go to press again. On the 20th, 21st and 22d larger flights showed themselves, and shooting is good at this writing. Market shooters that started out from Atlantic City made good bags, and the birds brought in on the first three days of the week were shipped to this city. Quite a number of short-billed curlew are going north, but are wild and do not stool well; black-breasted plover are more numerous than the other varieties. The birds will not locate at any point on the New Jersey coast, as they once did, and are only passing. Not many years ago willets bred on the New Jersey shore in considerable numbers, and their eggs were collected by some in quantities and considered a great delicacy; but it has been ten years since I have heard of a nest where they once hatched. Ocean City, a growing watering place on Peck's Beach, now occupies what was once a favorite breeding spot. A bear and cub were shot near Honesdale, Pa., last week. On being discovered the old bear, contrary to the custom of *Ursus* with young, beat a retreat, and the cub went up a tree and was first killed. The old one being followed was dispatched, making no resistance.—HOMO

MOSQUITO PREVENTIVE.—Baltimore.—A year or so ago I found a paragraph in a book by G. A. Sala ("Living London," p. 322), in which he stated that the English army, then in Egypt, were much annoyed by fleas, etc., and that they had found a protection in *Pyrethrum rosæum*. I tried the remedy the following summer. While knocking about Chesapeake Bay in a small catboat, it was my custom to camp on shore at night. These camps were generally in a clump of woods, and the mosquitoes, flies and fleas were simply awful. I found that by taking a small quantity of *Pyrethrum rosæum*, or the Persian camomile, making it into a paste with a few drops of alcohol, then diluting with three or four times as much water, applying to the exposed parts of the body and allowing it to dry, that the trouble was much mitigated. The pyrethrum is not poisonous, and may be freely used without danger. The drug is the basis of the so-called Persian insect powder, sold in all drug stores, but some of it is worthless.—D. H. B.

Camp Fire Flickerings.

"That reminds me."

112.

I HAD noticed while driving along the road some miles from home a large pond with a swampy, swalish surrounding, and while gazing on it, up flew a brace of wild black ducks. As was natural in any one fond of sport, my heart was in a flutter, and a mental resolve was at once made to come here to-morrow with my gun. I sought a companion, congenial both to the business in view, and the requirements of sociability, and secured a young, robust, zealous sportsman, who was an inveterate smoker. In him I had just the companion I wanted. The morrow was fine, but windy. Our drive, which occupied about two hours, was somewhat marred of pleasure by the strong wind which prevented our smoking and filled our eyes with dust, for the season had been wonderfully dry. Arriving at last, we tied the horse to the fence, and rammed down a heavy charge of No 4 into those old-fashioned muzzleloaders of that date. Now, for the first time, we noticed a large board intimating "No trespassing," which, however, caused no more trouble than the loss of a moment or so, in consultation. It was a brave deed, we thought, to attack that pond, lying as it did under the very shadow of the house and farm buildings, whose owner had expended labor and money in erecting those warning boards for our benefit; but the grass and the weeds were high and thick, which lessened the danger, and we had of necessity to crawl so as not to disturb the game.

Going on hands and knees in excruciating agonies and dire discomforts, our nether garments soaked, our heads throbbing and swelling fit to burst, we at last found ourselves in full view of the pond. But not a duck was there, and barring the two that had visited the place the day previous, I do not believe there ever had been any. We were both angry, and a look at either of us was as much evidence of the fact as if we had openly declared it. The strong wind which now blew with unsheltered strength on us, had a cooling effect, however, and we filled our pipes. As we puffed away, some thought, either of revenge or mischief, seized my companion, for he quickly said, "I wonder if this stuff would burn?" and by way of illustrating what he meant, applied a match to the parched reeds and grass. Oh, what a blaze was there! What a game the wind had all alone. It seemed to pick up tuft after tuft of red hot grass, and hurl them all over that swamp. It reminded me of Samson's foxes over again, or ten thousand will-o'-the-wisps gone crazy. The heat became intense, and we were soon hemmed between the two elements, fire and water, before and behind.

A shout startled us; then, as if in echo, ten, twenty more, and we beheld a regiment of agriculturalists on the double, each armed either with instruments of punishment or fire extermination, we did not know which. We could not stand in idleness any longer, so we went to work, and worked hard, too, by running with all our energy and strength along the edge of the pond, miring at every other step in our endeavor to escape the excited mob. I think we should have succeeded had not five or six men lain in ambush and seized us as we emerged from the swale. We did no fighting. We cowed. Discretion and valor had a meeting, and decided in favor of the former. Thoroughly ashamed of ourselves, we joined in fighting the flames, and after throwing down a few hundred rods of fencing and beating the blazing carpets till the spark dust flew thick about us, we became masters of the situation.

The rest is told in a few words. We footed the bill and said no more about it till now. I often think now that it would have paid me better to have bought a farm than to go seeking a couple of ducks that my own eyes had beheld flying away twenty-four hours before. VERAX.

CANADA.

113.

Ten years ago I found an Indian skull while hunting in Chaquaco Canyon, Colorado, and took it home to my ranch. I have had so much fun with it since that I have always kept it, and at this moment it is grinning at me.

I came to Kansas in 1878, and hung the skull in the office of my hotel. The country was full of land hunters from the East, who proposed to make farms out of a chunk of this desolate prairie that will hardly raise buffalo grass. They were to the last man very romantic and anxious to hear big yarns. My clerk observed that if he told the truth about the skull when questioned about it, the tenderfeet would seem disappointed, so he used to romance a little. One morning he related to a lone land seeker a most blood-chilling account of how he shot the Indian in the bowels and cut off his gory scalp with his own bowie knife. The next day another man questioned him, and he forgot that Number One, who was present, had ever heard anything about the skull, so he killed the Indian over for Number Two by putting out a biscuit baited with strychnine, and "ketching" him and afterward cutting off his head with an ax." "Hold on," says Number One, "you told me yesterday that you shot him in the bowels with a rifle and scalped him." "That was another time I killed him," remarked Jim, looking Number One mildly in the face. W. J. D.

114.

A young man who did not know a setter from a pointer or a trigger of a gun from the hammer, went from this city to Toronto, and became acquainted with some Canadian sportsmen, to whom he vaunted of his skill with the shotgun and success in the field over dogs. He was welcomed into the circle of shooters and promised by them a day's sport, they volunteering to provide him with gun and dog. A party was made up and duly repaired to a locality where birds were known to be abundant. Our hero (who told the story himself), with gun in hand, followed a setter, and after some tramping through the brush noticed the dog moving slowly and finally stop as if paralyzed. He thought that it was a hunting dog's business to hunt, and that a dog which grew tired and gave up so soon in the day deserved punishment for laziness, so picking up a piece of wood he hurled it at the offending setter, and started in amazement as a "lot of big brown birds" burst up before the dog. CROWN WAD.

ROCHESTER.

115.

Uncle John McK. was a local preacher, quite wealthy, and withal a good man. He was also a sportsman and well known in several counties around for his love of field sports. His case was the subject of frequent discussion among his brethren, but the old man still clung to his gun, rod, hounds and his profession.

One Sunday morning, while on his way to fill an appointment, he found his youngest boy, Russel, at the foot of the river fishing. The old man was justly indignant; but just as he reined up his horse the boy made a handsome cast and strike. The hard lines on the face of the father gradually softened as the play went on, and presently he said, "My son, give him the butt of the rod and he is your bass." Even then he was not forgetful of the duties of his calling, and when the boy plead the beautiful day and the voracity of the bass as the cause of his transgression, the father, mindful of the publicity of the place, leaned forward in his saddle and whispered, "Russel, my experience leads me to advise that just up around the bend of the river is the best fishing ground in the State." PARSON O'GATH.

OHIO.

WHAT THEY SAY OF "WOODCRAFT."

THIS book contains a series of useful instructions for those who go to the woods in search of health or amusement, and is, on the whole, a valuable companion and assistant to such as have not large stores of personal experience to draw from. It is systematically arranged and plainly written. * * * On the whole, the book is sound and practical, and well worth the reading.—*The Nation.*

This charming little book is written to teach the traveler how to journey through the wilderness with ease, and on perusing its contents we find that it is the experience of an old hunter, who gives the best of advice to those who go out in the woods for a season of rest and relaxation, and need to study lightness and economy in a forest and stream outing.—*Spirit of the Times.*

SEATTLE, Washington Territory, May 8.—I received "Nessmuk's" book, and was highly pleased with it; in fact, did not lay it down till I had finished it. It contains numberless hints of value to the novice, or "tenderfoot," and even some which we old hands might profit by. Success to old "muzzleloader's" venture anyway, and may he sell ten million copies.—H. H. L.

The newest volume of the FOREST AND STREAM series is "Woodcraft," by "Nes-muk." It is a little volume written in a sparkling vein, and crammed with hints to the camper-out. It is intended to teach the reader "how to make an outing a pleasure instead of a misery, a comfort instead of a calamity," and it is certainly one of the brightest books on the subject that has ever come to our notice. Not the smallest of its attractions is the illustration of the subject, even to the details of making a camp-fire, showing at a glance what the writer means to teach. It is a charming little publication, and is quite as attractive for its occasional dissertation on trout fishing, as for its matter-of-fact details of camp life.—*Portland (Me.), Press.*

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—III.

SHORTLY after leaving the spring we came to the "twin lakes," a pair of lovely little gems of water, separated by a high backbone a few yards wide at the top, over which the wagon road passes. So narrow is this ridge that from the wagons we could look down, seventy or eighty feet it seemed, on either of them; the one on the right appearing much lower than the other.

They are perhaps eighty rods long by half as wide, and are surrounded on the sides opposite the ridge by hills that are thickly wooded to the water's edge.

We could see no inlet or outlet to them, and our driver said he had never heard of their having any, nor was it known whether they contained fish or not. As this was a question we did not care to spend time in solving, we drove on, satisfied that the Master had scooped them out for some wise purpose which to us was a sealed book.

Skirting around the base of a lofty, forest-clad ridge, trending off to the left in a southeasterly direction, the road led us around the point on to another plain, and off in the distance we caught the shimmer of water and the sight of a green line some miles away that our driver informed us was the further shore of Black Lake. Our understanding had been that we were to have crossed Big Black River somewhere below and gone up on the opposite side from where we now were, as Merrill lived on that side and our camp was to be somewhere near his house; but we now learned from the drivers that it was impossible to cross the river without swimming it, so we had the unpleasant alternative left of driving clear around the lake to a point some three miles from the head to where we were to make camp.

And we learned, too, that neither of the three smart drivers knew where they were going or how to get there, nor did they know where Merrill lived, only that his place was twenty-two or twenty-three miles from Cheboygan and near Black Lake. Here was another "category," but we took the matter into our own hands and mildly requested them to "bile ahead till they smelt blud," or find Merrill's, if it took a week. The road led straight across the plains to the lake, which we struck a mile or such a matter from the outlet.

From the top of the bank overlooking the lake, we could see a small steamer at anchor near the further shore three or four miles away, which our driver said was used to tow booms of logs to the head of Big Black River—the outlet of the lake—and this might be brought over by a smoke signal to take us and our traps up to our camp, which would allow them to drive back to town that evening.

Four or five of us got out and took an old loggers' road down to the water to get a better view of the lake and study over the situation.

The driver's hint was not acted on and no smoke was made, except by old Ben in making a few remarks to fit the occasion, as the water was too shallow near shore to allow the steamer to get nearer than thirty or forty yards, which would leave us to float our heavier boxes alongside and get them and ourselves aboard as best we might.

This we did not propose to do, and we went back to the wagons and took the road up the lake in not quite as hilarious a mood as pervaded the party at the spring, for we knew by the slant of the sun that it would be long after dark before we reached Merrill's, where we could at least pass the night, or what remained of it, and go to camp early in the morning.

But we were in for it and drove along at a good pace without grumbling, having made up our minds that growling would not shorten the distance nor find Merrill's clearing.

When near the head of the lake, shut off from view, however, by a belt of timber, the road forked, and the drivers soon decided they did not know which one to follow. The one leading to the right might be only an old log road ending at the lakeside; the other they thought led into the State road a mile or so further on, which crossed the Rainey River near the head of the lake. "Nothing like having drivers that don't know anything," remarked the Scribe, "as it gives us a chance to run the whole show for a brief period ourselves."

We settled the matter by taking the right hand road, as promising a near cut, taking the chances at the same time on getting through, or camping somewhere for the night. At the top of the hill we got out, except old Dan, Frank and the drivers, and forming ourselves into a pioneer corps, went ahead, the wagons following after. Down a steep, sandy hill, and into a cedar swamp bridged by a corduroy of poles and logs, a matter of forty rods from the main road, and we came suddenly out of the tangle onto the beach at the very upper end of the lake. Here the road seemed to end, and we were in a worse category than ever, for it would be a serious matter to turn around here and get the heavily loaded wagons back to the top of the sandhill.

When our minds were about made up that we were in a trap, we noticed faint wagon wheel marks in the bushes to the left which the Scribe and I followed a few yards and found a good road leading along a strip of low, open bottom land between the beach and the hill a few rods back.

A hundred yards further, we stood on a substantial wooden bridge spanning the Rainey River, only a few rods from where it flowed into the lake, and from this point we had a good view of this beautiful sheet of water for the greater part of its length, which is about nine miles. It was fully as wild as we had pictured it.

Sweeping away around to the left in the form of a deep bay, to a point six miles or more below, where the lake narrowed from six miles, at its greatest width, to about three and a half miles, was an unbroken line of wooded shore, not a sign in sight of clearing, house or shanty to mar the harmony of its green setting. Down the right hand side, near which we were, the shore line was nearly straight, and as far as we could see for a trend in it to the northward, the general features were the same, woods and bushes nearly down to the water the entire distance. It was a rare, quiet picture, but we had little time in which to enjoy it as the sun was nearly down, and Merrill's yet in the dim and uncertain distance—verily not a cheering prospect of seeing our camp that night.

We shouted to the boys to come ahead, and following the road along the bottom for perhaps an eighth of a mile it led us off to the left up a low rocky hill (the first rocks we had seen) out onto the level country and into the State road. Soon we saw a faint blue smoke through the woods, then a house, and as we came abreast of a small clearing by the roadside, a man hoeing in a "tater patch," the whole "farm" fenced by the road on one side and a wall of woods on the other three. Walking over to the stranger, who on noting our ap-

proach had come to a rest on his hoe handle, we bid him good evening and asked if he could direct us to one Merrill, who as near as we had been able to learn, lived somewhere in this neighborhood. He could, and pointing across the road: "He leef over dare 'bout mile." This was good news, but when he said we would have to go around three or four miles, as there was no road through the woods in the direction he had pointed, we felt our grip relax and had a mind to camp right there for the night, but finally decided to go on to Merrill's, or "kill every hoss and driver in the procession." as Ben said. "Follow State road 'bout mile west," said the Frenchman of Canadian extraction: "Mebbe leetel more'n mile; come to schoolhouse (they have schoolhouses in Michigan if nothing else), turn to right, follow road mile north, turn to right, go mile east, come to Merrill."

Here was a section of land with roads on three sides of it, but the one we most needed just at that particular juncture, appeared to have been left for us in the shape of a howlin' wilderness.

We made a few remarks right there at the edge of that tater patch that would not dress up very well in print, so I will leave them to the imagination of the reader.

Mounting on the wagons as they came up, we thanked our friend of the hoe for the directions given, and were off for the schoolhouse at a good jog, for this State road is a good one and kept in good repair.

As we turned north at the section corner, old Ben selected from a large stock of plain and ornamental oaths kept constantly on hand, one that seemed to fit into the right place, and swore "that mile back to the Frenchman's is the longest mile on the face o' this livin' earth; we've come three mile et we've come a solitary foot."

By the time we turned into the road going east it was so dark we could feel it, and the horses were left to pick the way for themselves, as any attempt to guide them would have led to a calamity in the shape of a dispute with some invisible stump as to which was entitled to the right of way.

We caught an occasional glimpse of a patch of sky up through the wall of trees lining either side of the narrow road, which only seemed to intensify the gloom through which we felt our way. The only sounds which broke the oppressive stillness was the rattle of our wagon, as the patient, intelligent horses picked their weary way carefully through the blackness, a grunt from old Ben or the writer, a whine from Dick, or a string of high-flavored adjectives that a pi-usly afflicted type setter would probably represent thus: —— —— — —— ——, as a wheel would strike an unusually large root, with which this delightful highway was numerously infested.

We stopped two or three times to listen for sounds from the other wagons, but nothing broke the silence but the breathing of our tired horses. We knew the spring wagon ahead of us was all right, but the one behind gave us some concern as it had only the driver and Frank to pilot it through the darkness, and we were fearful lest they had missed the way or got lost in the tangles of another "huckleberry patch."

At last we shouted loud and long, and waited for a response from the rear. A clarion blast away ahead in the hair-raising voice of Old Knots was all that came back, and we drove on, leaving them to find the way as they might, or pass the night in the "bresh," an exhibition of brotherly feeling that, after thinking over seriously, I trust will not be an example set up to copy after, but we were a trifle riled at them for not keeping us in sight at the schoolhouse, and made ourselves believe that under the circumstances we could do no better.

When we had felt our way through the woods for "not a solitary foot less'n five mile," as Ben averred, we thought we saw the faint glimmer of a light ahead to the left, and the next minute were plunging through a miry swamp that must have taken the horses to their knees. A pole or log across it here and there—a miserable make-believe that an attempt had once been made to corduroy it—only made it worse, and it was by the most desperate efforts of the brave team that we reached the hard ground four or five rods ahead.

Here an opening in the woods, that looked much lighter than the inky gloom from which we had just emerged, promised a "clearin'," and directly, "Come ahead, boys; here's a house," infused new life into us; and in a few minutes we were off the wagon with the others, at the edge of the clearing, trying to shake our loosened joints together again after the severe jolting of the last mile.

Out in the clearing, a hundred yards or so, a couple of dogs were barking furiously, "ten yelps to a breath," as Ben expressed it, and, joining in the racket with a united yell, we soon had the satisfaction of seeing a light slowly approaching, preceded by the yelping dogs. As it came nearer, "Shet up Turk, don't be so fresh," quieted the dogs, and as the light flashed on us, "Hello, gentlemen; this must be the Kingfisher party," from a gruff voice, was followed by a brief introduction to Mr. Merrill, the long-sought and hard-to-find, the dogs meanwhile sniffing at our heels, undecided whether to make friends or snatch a veal cutlet out of our calves. A sharp rebuke from their master, followed by a vigorous kick at one of them which he dodged with a neatness and celerity that showed long practice in avoiding these gentle reminders, put a sudden stop to their investigations and the "talk" went on without further interruption. Merrill claimed he had not received my letter asking plain directions how to find his house, nor had he expected us until the next day, else he would have met us with the boats at the point where we first struck the lake, and as we were really one day ahead of the time set, he had the best side of the question, which gave us little room to talk back.

Still no sound from the lagging wagon, and we began to fear they had met with a mishap of some kind. Merrill went with the lantern to the edge of the swamp and "hollered" at short intervals in a voice that must have awakened every sleeping varmint within two miles, and finally when we had about given them up as lost, an answering whoop announced they were coming. When they came to the mud hole, we fully expected they would stick, as they had the heaviest of the three loads and a pair of light horses, but as Ben said, "The little fellers was chuck full o' sand and grit," and they brought the wagon through with a regular step that showed how reliable they were in a tight place. Their late coming was due to not keeping us in sight at the schoolhouse, and they had driven straight on past it a mile or more before discovering their mistake. "Huckleberries," growled the Scribe, which was probably nearer the mark.

But now, here we all were, in the suburbs of Merrill's unfenced tater patch, tired with the long ride and walk of over thirty miles, hungry as wolves, and best of all, in excellent humor. The horses were unhitched, watered, and given a well earned ration of hay and oats, the frogs carried to a little pool near by and a couple of buckets of water dashed over them and left for the night, and then it was mildly hinted to Merrill that if the trouble were not too great, a trifle in the way of satisfying a feeling of emptiness pervading the party would endear him and his good wife to us for the remainder of our sojourn, to quote Ben, "on the face o' this livin' earth." He said we would "have to ask the 'boss' about that," and repairing to the house the good woman was prevailed on to fry some bacon, slice up a huge loaf of old-fashioned home-made bread, and brew a steaming pot of coffee, and this, with butter and eggs procured from our provision box in one of the wagons, made a meal that Ben declared "jest laid over anything in the way o' eatin' he'd seen in a solitary year."

Frank insisted on teaching the matron of the house how to make good coffee and boil eggs to the proper turn, but his officiousness was nipped in the bud by a timely hint, and he retired to a corner an abashed spectator of the proceedings.

I write this that in case it meets his eye he may take unto himself warning not to tamper with this pernicious berry in future while on his way to camp, and if the hint mayhap touch any of the brethren in a tender spot, I trust no offense will be taken, and that it may bear better fruit than the berry in question.

We found the accommodations at the "Hotel Merrill" to be exceedingly meagre; the back part of the one room of the cabin being curtained off into sleeping rooms for the heads and smaller members of the somewhat numerous family, while the front and larger part served as kitchen, dining-room and room of all work. Overhead in the loft, Merrill informed us, were more of his boys and four or five sleeping lumbermen, so we were forced to betake ourselves to the 'tater patch or the "bresh."

Without much trouble we got out of the wagons a couple of boxes packed with blankets, and distributing them around, each one proceeded to stake out his claim by the light of the lantern.

Old Danny was, however, made as comfortable as possible on the floor in the house, while Frank, with a commendable concern for Dan's welfare, rolled himself in a single blanket and was soon snoring near him, an odorous terror to any foolhardy mosquito that might come prowling around within the range of his breath.

The Deacon made friends with the two dogs, and wrapped in his blanket, passed the remainder of the night with them by the side of the house without any serious trouble arising between the trio. The rest of us scattered ourselves around and under the wagons, Jim taking much comfort to himself in the possession of an extremely soft pine board which he found lying near the house.

Old Knots, Ben, Dick and the drivers selected places to their pleasement and made their beds, while the chronicler of this night's comforts and miseries found a soft spot in the sand near a wagon wheel that just fitted his frame, where he rolled himself in the ample folds of a rubber piano cover and stretched his weary bones for a few hours much needed rest. It must have been midnight when quiet reigned in the tater patch, but not long did this quiet abide with us. The skeeters and punkies seemed to have been apprised of our coming and had been coming in from all quarters since our arrival, until they had become, as the Scribe remarked, "quite multitudinous," and were sharpening their bills on the wagon tires and waiting for us to settle down, to begin their work of making life a burden to us.

While we were moving around they were not very troublesome, but when everything was still, and not having the protection of bar, net or "smear," they began business in earnest. Mutters and growls from all sides, and imprecations not loud but of great depth and frequency floated around in the darkness until it was a question which were the more numerous, the skeeters or the fragmentary profanity fired at them, and not a few getting in range of Ben's remarks must have escaped with singed wings and the temper drawn from their bills. But Jim, of whom much had been expected in this line, said not a word; he just went quietly off to sleep with as much unconcern as though his pine board was a couch of down and not a skeeter or punkie in miles. Dick and one of the drivers were, however, the objects of their especial attention, Dick's locality being plainly indicated by a stream of whines, disjointed utterances of dire import, and vigorous slaps that were simply astonishing.

A few of the pests found their way into my breathing hole through the folds of the rubber, but I was too tired to remain long awake and went to sleep with the sound of Dick's gentle voice ringing in my ears, and knew no more until aroused by him at daybreak with, "Get up you old crank and let's get out of this, for I'm about eat up by them cussed croppies, or whatever you call 'em." (He meant punkies, but had forgotten the word.) He and the driver had not slept a wink the whole night. When they could bear it no longer, he said they got up and paced up and down the road a few yards till the first streak of dawn, and, according to his estimate they must have wiped out of existence fully a million "croppies" and half as many skeeters, and he further proclaimed in a voice reaching for high C, that he "wouldn't go through another sich a night for all the fish in Michigan, and the d—elightful State throwed in." (Note.) Dick held a consultation with himself sometime afterward and decided he would like to try it all over again, with the first night left out.

[TO BE CONTINUED.]

THE REVALLIER OR RAVALLIA.

Editor Forest and Stream:

In reading up the back numbers of FOREST AND STREAM, I find in the issue of Jan. 17, 1884, a communication from my friend, "Al Fresco," on the ravallia of the west coast of Florida. He seems to be in doubt as to the identification of this fish, but he will recognize it at once under the name of "snooks," as it is called on the east coast. I referred to it particularly in both series of my Florida papers in FOREST AND STREAM, under the various names of cobia, crab-eater, sergeant-fish and snooks. The name "snooks" is used as early as the seventeenth century in the account of the voyages of Captain William Dampier, who also mentions mullets, ten-pounders, tarpoms, cavallies, paricootas, gar-fish, sting-rays, Spanish mackerel, etc.

In the communication referred to, "Al Fresco" embodies an opinion of David S. Jordan, who supposed (from the similarity of sound of the two names) the ravallia to be the robálo (*Centropomus undecimalis*), but I never heard "ravallia" or "revallier" applied to any fish on the west coast but the sergeant-fish (*Elacate canada*).

In "Fishing with the Fly," Dr. Kenworthy alludes to the ravallia being taken with the artificial fly by Dr. Ferber, who describes it as resembling the pike-perch, and that it is taken up to thirty pounds in weight—all of which I can indorse, though in shape and habits it more nearly resembles the true pike, especially in the form of its head and dentation.

It is probable, however, that there exists some confusion in the use of the name ravallia on the west coast of Florida, as the two fish mentioned are somewhat alike in formation and appearance, and both have a very distinct black lateral line.

JAMES A. HENSHALL.

CYNTHIANA, Ky., May 17.

USEFUL HINTS.

THE articles on fly-rods, started by Mr. Wells in FOREST AND STREAM, have been very interesting to me. Since my first essay in fly-fishing some years ago, I find that my enthusiasm for the sport increases each season; and the subject has become quite a hobby with me, occupying much of my time and thinking in winter as well as in summer. Being possessed of an expermenting turn of mind and some mechanical experience, I find a pleasure in making my own rods and flies. I have now ready to take into the woods the coming season rods of my own make and of four different materials, viz., split bamboo, bethabara, hornbeam, ash and lancewood. I have made, as an experiment, some joints and tips of two pieces of wood glued together, with the grain running in opposite directions. All of my rods fit into one handle about fourteen inches long. I do not use dowels or pins.

For a ferrule cement, I make a composition of about two parts gutta-percha and one part white rosin. The gutta-percha is nearly white, and comes in thin sheets looking a little like a piece of white birch bark. It makes an excellent wax for wrapping silk, according to the receipt of Norris—one ounce white rosin, one dram gutta-percha and one teaspoonful raw linseed oil. When a rod breaks near a ferrule I do not try to dig it out, or put it in the fire, as I once did, but I lay it in a hot oven or over the chimney of a lighted lamp for fifteen minutes or so, when the wood will shrink so as to drop out easily, unless the ferrule has been pinned, in which case it will be necessary to leave it until the wood has become charred, which will occur without softening the temper of the ferrule.

I do not remember to have seen described what seems to me the best way to fasten a silk lashing. I have read about winding over a quill and then drawing the end through it, and about threading a needle and running it back under the winding, etc. I take a piece of strong silk (buttonhole twist), double it, and lay it over the lashing, parallel with the rod, with the loop or bight extending beyond the lashings. Then take three or four turns of the lashing silk over the loop, insert the end in the loop and pull it through under the lashings. I make use of the same fastening at the head of flies.

One more small hint is not to allow rubber of any kind to come in contact with your flies; the sulphur in it will tarnish the tinsel.

As I believe that correspondence in regard to angling resorts is invited by FOREST AND STREAM, I wish to say a word about a locality in which I have only a friendly interest and a desire to have it better known and appreciated. I refer to the camps of Mr. Kennedy Smith at Tim Pond and the Seven Ponds, Maine. Each season for the past three years I have spent about two months with Mr. Smith, and I intend to go again the coming summer. His log camps are models of their kind, every one is well treated, and the charges are very moderate. The trout are not of the largest, for Maine trout, but they are there in sufficient numbers to satisfy any reasonable expectations, and the days that they will not rise to a fly are very rare throughout the season; and they are remarkably beautiful and gamy and fine-flavored trout as well.

There is another reason why I go each year to this region. I am a sufferer from that strange disease known as "hay fever," and I should live in torment at home from the middle of August until the appearance of frost. I escape this serious trouble altogether at Tim Pond, and it is a medicine that is very pleasant to take. In that vicinity there is none of that abominable "rag weed" or Roman wormwood, the pollen of which is believed to be the exciting cause of this distressing malady.

I am sure that I have seen queries in regard to hay fever in the columns of FOREST AND STREAM, and perhaps the above may be of interest to some of its readers. W. G.

SPRINGFIELD, Mass., May 10, 1884.

PHILADELPHIA NOTES.

WEAKFISH (blue lights) are being seined in large numbers down the bay on the Delaware State shore. The "neck" farms in the vicinity of the fishing grounds are deriving a benefit from them as a fertilizer as there is no market for the fish, they are so numerous.

Bluefish are reported very scarce on the New Jersey coast this spring, from this the baymen argue that fishing with rod and line will be good the coming summer, as the absence of the bluefish will allow the varieties upon which they feed to come into the bays freely.

It is stated by John Upperman, of Kensington, Phila., who is said to be the oldest shad fisherman of our city, that the largest shad caught in the Delaware River in his experience of fifty years weighed ten pounds, and that the size of the fish has steadily decreased until artificial propagation was attempted about fifteen years ago. Since that time there has been a great improvement both in size and numbers, and now a six-pound shad is by no means uncommon. This year a very marked difference is seen and hundreds of shad tipping the scales at six to seven and a half pounds can be seen.

On the roof of the Philadelphia *Record* building there is a water tank which holds 18,000 gallons, this is supplied by the city main. Last week when the engineer who has charge of the steam pumping machine cleaned out the tank he discovered numerous eels from six inches to nine inches in length in his bucket. A further investigation brought to light catfish four inches long. As the water is pumped into the tank through a three-inch pipe, it is supposed both the eels and catfish found their way from the Schuylkill River when they were very small. The *Record* proof-reader, who is a disciple of Uncle Thad Norris, can now go up-stairs, bait his hook at dinner hour, and save car and steamboat fare to Wissahickon.

The Cape May, N. J., Porpoise Fishing Company are about erecting extensive buildings on the bay side for the double purpose of extracting the oil from these fish and turning the refuse into phosphates. The venture of this company last year with its patent nets was successful, but we prophesy continual fishing for them will, in a few years, drive them entirely away from the section referred to.

HOMO.

FISH DAY AT WORCESTER.

THE second annual fish day festival of the Worcester Sportsman's Club occurred on Wednesday, May 21, and was a success in every respect. The rules governing the affair were the same as last year, except that a fine of one dollar was imposed upon every member who did not participate in the sport. This rule had the desired effect, and called out a much larger number than usual—not that they cared for the dollar, but they did not like to be branded as delinquents. The conditions prescribed were: "Every fish on the list to be caught with hook and line, on the day set for the fishing. Points—Trout, 16 points to the pound; pickerel, 4 points to the pound; perch, 2 points to the pound; pout, 2 points to the pound. For every trout that weighs over eighteen ounces, an additional point to every ounce will be allowed. No private trout streams or ponds to be fished."

The fishermen went in all directions, some to New Hampshire, some to Connecticut, some to the hills of Berkshire county, and a few who did not aspire to trout fishing trolled for pickerel or bobbed for perch and pouts in the ponds about home. It was the first really hot day of the season, and some of the men who are unused to being out of doors came in with faces that would have made good headlights for locomotives. All were tired, but jolly, and nearly every man had a good story to tell concerning the exploits of the day. The scene in the small hall at the Bay State House on Wednesday evening was a delightful one to any man who enjoys looking at a fine display of fish. A long table was spread with platters, in order that those members who had made good catches could spread them out in the most attractive style, as it was pleasant to watch the expression of their faces as they proudly unloaded their creels. It was truly a magnificent display of trout, to say nothing of the other varieties. The finest displays were those of Capt. Jacobs and Chas. A. Allen, caught in New Hampshire; John R. Thayer, caught in Connecticut; H. E. Smith, Davenport, Verry and Barton, caught in Berkshire county, and Samuel Brown and James F. Davenport, caught in the western part of the State. The count closed at 9 P. M., with the following score:

CAPT. GOLBERT'S SIDE.		CAPT. JACOBS'S SIDE.	
R. L. Golbert and Alba Houghton	241	A. R. Jacobs	125½
A. F. Earle and Frank P. Douglass	60	C. Hartwell and A. Colby	240
John B. Goodell	62	A. H. Perry	33
E. S. Knowles	26	H. W. Eager	34
Stedman Clark	10	V. Sheldon and Wm. Coe	88
B. C. Sumner	127	R. J. Healey and S. Porter	72
J. A. Titus and W. Thayer	48	Chas. A. Allen	70½
G. J. Rugg and L. G. White	30	E. B. Stoddard	15
H. E. Smith, S. T. Davenport, H. B. Verry, C. S. Barton	465½	M. O. Whittier	23
Samuel Brown and J. F. Davenport	232	Joseph Garland	13
R. D. Perry	15	A. B. F. Kinney	31
Joseph H. Smith	78	C. R. B. Claflin	39
S. Hamilton Coe	57	Edward Wright	38
B. Henry Colvin	10	Jesse Smith	11
C. F. Batchelder	54	John R. Thayer	65
J. E. Fuller	48	W. L. Davis	71
		Caleb Colvin	08
		L. R. Hudson	07
		Waldo Simpson	09
		O. L. Taft	11
	1,563½		1,003

Captain Jacobs and his men bore their defeat good-naturedly, and Captain Golbert received the congratulations of his friends. The crowd of spectators scattered away and a set of tired fellows went to their homes to dream of the dinner they were to enjoy on the evening of the following day. On Thursday evening, the members with the invited guests assembled in the parlors of the Bay State House one hundred strong, and about 9 o'clock marched to the large dining hall, where Richardson's orchestra was discoursing excellent music. The hall was finely decorated; the tables laid with rare taste and decorated with a profusion of beautiful flowers. It was strictly a fish dinner. After the company had done ample justice to the dinner, President White opened the "after dinner exercises" with a neat speech, introducing H. B. Verry as toastmaster for the evening, who called up several gentlemen in response to sentiments. Mayor Reed opened the speaking with a witty and supposed apropos story. Pleasant remarks were made by Messrs. Jacobs and Golbert, captains of the teams of fishermen, ex-Mayors Hildreth and Stoddard, Gen. A. B. R. Sprague, Dr. Merrick Bemis, President E. O. Parker of the City Council, Dr. W. H. Raymenton, Messrs. John Thayer, E. S. Knowles and F. A. Gaskill. E. SPRAGUE KNOWLES.

WORCESTER, Mass., May 24, 1884.

SCHROON LAKE.

FULL of hope, desire, zeal and ambition for a pleasant trip, we boarded the train at the thriving lake town, Plattsburg, Friday, the objective point being the Trojan city, Troy. Simple chance and nothing more caused your correspondent to become erratic and deviate somewhat from the programme so hastily made the day before. Leaving the train at Crown Point, we boarded the stage for the business part of the town, known locally as Hammond's Corners. This place supports a lively little local paper, and from our short acquaintance with its editor, R. W. Billett, we should judge he was able to accomplish the duties involving upon him in the way of writing up church sociables, quilting bees, and the many other little trifles so necessary for the peace of a country village. From him we learned many valuable bits of information, and if he should happen to read the issue of your paper containing this, he will please accept our sincere thanks.

It was our intention to take the C. P. I. Railroad to Hammondville, and it was also our misfortune, of fortune, to miss the train, so engaging a conveyance we determined to make the best of the matter and find consolation in the fact that the scenery would be more enjoyable from a carriage than the railroad coach. By this time Troy was nearly forgotten in the one idea of seeing a part of the world-renowned Adirondacks, and Schroon Lake seemed the most feasible point from which to resume our journey Troyward.

The scenery after leaving Crown Point Center grows each mile more grand. To the east the Green Mountains of Vermont roll upward as far as the eye can reach, and to the north are displayed the outskirts of the Adirondacks, sloping downward to Lake Champlain, dotted here and there with farms, each just beginning to show the thrift of its worker.

Soon Hammondsville is reached, and stopping to inquire the way to our destination, we view with wonder and surprise the many striking features of the iron mines which are here. The sun gives us warning to move on, and reluctantly leaving the works of man we enter deeply into the works of nature, and soon are where we can view the different features of the woods. To the far north can be seen towering up among the clouds nearly 6,000 feet, and to the west, grand piles of mountains, which convey an idea of grandeur to the beholder that no others inspire. The very air, the clouds, the surroundings, bring forth exclamations from the tourist, and leave wonder in the mind that the section should be blessed with such a multitude of charms and attractions. We have viewed Pike's Peak in Colorado; with alpenstock in hand we have climbed the Alps; we have been astounded by the greatness of the Himalayas, but never have we seen so many wonders combined as one can find in the Adirondacks. We are passing through a wilderness, with mountains on the one side and deep and awe-inspiring precipices and chasms within a step from the wagon track on the other; fear, mingled with a fascination, besets the timid, and frightened, yet dreading to leave the scene, he views the panorama of nature silently, with an emotion too great to express by word or pen.

It is now quite sundown and the sweet music of the forest warblers recalls vividly to our mind the stanza:

> "O, nightingale, that on yon gloomy spray
> Warblest at eve, when all the woods are still,
> Thou with fresh hope the traveler's heart dost fill."

Nature seems king, but not for long. Soon we emerge from the wilderness and enter quite a thickly populated agricultural district, and we know we are nearing our Mecca, Schroon Lake. A little after dark we alight from the carriage at the hospitable doors of the Windsor House.

Let us turn from poetry to the practical. Schroon Lake is fast becoming a popular watering place, and each year brings new faces as well as the old ones. Unlike Saratoga Springs, Long Branch, Newport, and other older resorts, it retains its primitiveness. The sound of the locomotive is yet unknown, and nature has decreed that the railroad cannot penetrate the wilderness. It would be an innovation that would not be endured by the people who congregate here year after year, and the people here would regard it in much the same light. Like Saratoga, nearly every resident "takes" boarders, and besides the boarding houses there are several magnificent hotels that surprise the stranger by their beauty and elegance.

Among the leading hotels can be named the Leland, Windsor, Ondawa and Lake House. The two first named are comparatively new and both are modern and fully up to the wants and needs of the seeker after pleasure and rest. The Leland accommodates 200, the Windsor 100, and the Ondawa 75. The Lake House, another popular hotel overlooking the lake, is the nearest to the sheet of water that gave the place its name. Of the lake itself little remains to be said. Its charms, its beauties and attractions have been told in poetry and prose. My next letter will be from further back, and my only wish is that you were to be with me. ED. M. H.

TIM AND SEVEN PONDS.

THE sportsmen in Connecticut were greatly pleased to see in your advertising columns of last week notice that the resorts named in the caption of this article are soon to be opened to their many friends for the season. It is very gratifying news to us in this section. The cold season has been long. The spring weather has been treacherous. The birds came when the almanac said they should come, but the snow and ice caused them to retire. They came again and began their homes, but the cold storms drove them back. And so they have struggled and are now striving with wind and wet. And our trials have been as disappointing as those of the little gay-plumaged songsters. Some of the bravest of us went to the brooks, but trouty had no overcoat and was not there. We have been several times since, still only a few of the toothsome swimmers could be found. A few gentlemen went to a distant part of our State and returned with fairly well-filled creels. Our streams are well supplied with water, and later we hope for good strings. As I have intimated, our tackle has been in good order for a long time, and we have been restless to use it, and I repeat we were glad to learn our favorite fishing grounds of Northern Maine are soon to be ready for us. We have great expectations, for since the nefarious work of poachers has been stopped, notwithstanding the large and increasing number of visiting sportsmen, the trouting is better in these ponds than when they were opened by Smith to the public. This fact was very noticeable last year to those of us who have fished these waters for five or six years. The first of June, I think, will be about the right time to reach there, for the ice is scarcely out of the ponds and snow out of the buckboard roads. Since the great wind of last autumn the roads have been cleared of fallen trees and put in better order than ever before the entire distance to Seven Ponds via Tim Pond. New horses and wagons have been procured to run between Smith's farmhouse and the cabins at the ponds. The cabins are being repaired and refurnished. So large a number of customers, old and new, have made and are making engagements for cabins and board that it is found necessary for Smith to make much greater preparation than any previous year. The trouting of these ponds in the Dead River region is not damaged by water-power companies and steamboats, as are the lakes at the head of Androscoggin River, described in the FOREST AND STREAM of recent date; nor are tons of trout sent away by express, to spoil on the route before reaching their destination. Consequently, sportsmen find that Tim Pond and the Seven Ponds and others in this region maintain their high standard of excellence for fishing, while the lakes in the region to the west are on the retrograde. A. W. Robinson, of Boston, seeing the greatly increasing demand for information about the Dead River region, has in preparation a guide book and map of this interesting section of the country. I am not informed just when it will be given to the public.

I find a large number of the gentlemen from this State and from Boston will go this year via Farmington and Kingsfield to Kennedy Smith's farmhouse, Eustis, Maine, from thence they and their luggage will be taken to the ponds on buckboard wagons. The location of the Franklin & Megantic Railroad has been approved to Kingfield, and the contracts for construction made. Cars are expected to be running on it this autumn.

A new feature is to be added to the attractions of Seven Ponds for the enjoyment of Smith's visitors. He is to cut and spot a trail to the top of Snow Mountain for a sort of observatory, from which can be seen almost the entire Dead River valley to the Kennebec River; and one can see Lake Megantic in Canada, also the boats when on the lake, and some of the settlement. It is a grand view. Two years ago I witnessed a portion of its magnificence as I ascended to the second plateau, about three-fourths of the distance to the top of the mountain. It is thought that ruffed grouse have wintered well from the amount of drumming from the drummers. More anon. J. W. T.

NEW BRITAIN, Conn., May 22.

MICHIGAN ANGLING NOTES.

BLACK bass have been caught in large numbers during the past two weeks in the Clinton River, near Mount Clemens. Several large catches are also reported as having been made at Johnson's Channel, St. Clair Flats. As it is the spawning season, and as the fish are caught off the spawning beds, I am sorry that there are not more sportsmen to rebuke the unthinking anglers who are boasting of their success. The fish are now thin and poor, and I regret to say that many are caught with trolling line and spoon. How any one can find sport in trolling for black bass when rod and reel are near by is beyond my conception.

Perch have been remarkably plentiful this spring in all the waters about Detroit. In fact, the great numbers taken by anglers have been matters of remark. I have a sneaking admiration or love for the gamy-looking perch. They surely present an exceptionally animated and beautiful appearance as drawn from the water, with fins all erected, they gleam and dance in the sunlight. And what a memorable thing it would have been to have landed one of these Western one-pound beauties years agone when, a little shaver, I used to haul out the "pumpkin seeds," dace and shiners down in old New England. Yes, I love the toothsome, hardy perch. I can appreciate them for what might have been. Remembering the numerous lickings received for playing "hookey" in those halcyon days to catch a dozen or so paltry little fish, I verily believe I would have deliberately agreed to be walloped for a week for the sake of a big perch such as I caught to-day.

The season at the various club houses at the "flats" has fully opened, and the regular habitués of the flats now make their weekly pilgrimages to their fascinating resorts.

It's not often that a Frenchman, born and bred as it were in a boat at St. Clair Flats, loses his life in their waters. Several fatal casualties have occurred during the last few years, but the victims have been gentlemen who went there for recreation, and indeed who sailed or rowed without a professional punter in their boats. Last week, however, Clowel Teabedo, for some time cook on Mr. Harry Newberry's hunting yacht Venita, and who was considered more at home in a boat than elsewhere, lost his life. He left Herson's Island in a small boat at 5 P. M. bound for the Canada shore, eighteen miles away. Shortly after his start a heavy gale commenced to blow, which lasted for twenty-four hours. Nothing has been heard from him, and it is not to be doubted that he was capsized and drowned. Careful search has been made, but nothing found to explain the poor fellow's fate.

The lovers of grayling fishing are making ready for June 1, when the open season on these beautiful fish commences. Wading stockings and pants are being overhauled or purchased, and from appearances a far greater number of anglers than usual will take to the streams to enjoy the delicious sport. DELTA.

DETROIT, Mich., May 24, 1884.

A SWORD SWALLOWER CHOKED ON BASS.—Complaints concerning persons catching black bass out of season have been numerous of late, but despite the vigilance of the members of the Passaic County Fish and Game Protective Association the complaints could not be traced to any good source. Some of the members of the association have taken trips into the country on various days for the purpose of ascertaining whether fish and game were taken out of season. In most instances it was found that there was no ground for the stories circulated; in others it was found that the accounts had been grossly exaggerated and that the catching of fish was done by boys who occasionally captured a black bass while fishing for other fish. The question has frequently arisen what is a person to do if he catches a black bass by accident. There are various methods of catching fish and if a person adopts such a method as is generally recognized as the proper method for catching catfish, suckers or dace, and then accidentally captures a black bass he cannot be held responsible, for the law does not punish accidents unless they can be avoided by the exercise of reasonable prudence. But if a black bass is caught, say on a worm, it is the duty to return the bass to the water if the fish is not so badly injured that he will necessarily die. Should his gills be badly cut it is not thought wrong to take the fish home, as throwing him back into the water would not tend to increase the number of fish there. Last week several members of the association were informed that Mr. John J. Garrabrant and Signor Carlo Benedetti, the sword swallower, had returned from Greenwood Lake with a large mess of fine fish, including several black bass. The allegations were at once reported to Fish Warden Harry Keenan, who is also the warden of the association, and an investigation showed that Garrabrant and Benedetti had displayed some of the black bass at the depot of the New York, Susquehanna & Western Railroad on their return to this city. Quite a number of people had seen the fish and the warden considered himself justified in making a complaint. Senator Griggs, the counsel of the association, accordingly drew up a complaint which was sworn to last night before Recorder Greaves and warrants were issued. Greenwood Lake lies partly in New York State, and over that portion magistrates in Passaic county have no jurisdiction, but it is said that in the present case ample evidence will be forthcoming to show that these fish were caught in Passaic county. Should it appear otherwise there is every probability that the accused will be arrested in New York State as soon as they return there, the association intending to protect the waters of Greenwood Lake at all hazards, as this is the only sheet of water near New York where first-class black bass fishing can be had. Mr. John J. Garrabrant runs the Passaic Hotel and Signor Carlo Benedetti is the famous sword swallower who has given repeated exhibitions in this city of the wonderful construction of his swallowing apparatus.—*Paterson (N. J.) Press.*

BLUEFISHING IN GREAT SOUTH BAY.—A few days ago, on the 14th inst., myself and friend paid a visit to the Prospect House, Bay Shore, L. I., and after a night's sojourn started at early dawn in the sloop Pelican for a trial of fishing for bluefish, none having as yet been caught this season. We determined to be first in the field or on the water. We were soon on the blue wave and began to troll for the swift and gamy fish, and before long had our reward in hauling in fish after fish, weighing from 7 to 9 pounds each. Around us by this time many other boats had congregated, and all seemed to be busy, and almost every boat had quite a successful day; one boat taking 35 magnificent fellows. This being the first run of the season, the fishermen are alive and anxious to get out. From now until the 20th of June the fish will be in great abundance and afford splendid sport. Bay Shore is the finest situation on this magnificent bay.—YACHTSMAN.

Woodmont Rod and Gun Club.—Mr. S. H. Kauffman, the president of the Woodmont Rod and Gun Club (of Washington, D. C.), reports that the institution is in a reasonably prosperous condition, financially and otherwise. From the annual report we take the following: "Owing to the frequent rains of last summer and the consequent high and muddy water in the river, the opportunities for angling were, during 1883, fewer than usual, and the season was, on the whole, an unfavorable one. Nevertheless there were a number of excellent catches reported, both as to the number and size of fish taken. Several of the members had also good success with the gun, bringing in deer, turkeys, ducks, and much small game. A case of poaching on the estate of the Club by two persons was reported during the winter, and instructions were given to cause the prosecution of the offenders, if possible, but up to the present time no arrests have been reported. In this connection I have much pleasure in stating that Mr. A. H. Evans, to whom that service was confided at the last annual meeting of the Club, succeeded in securing, at the late session of the Legislature of Maryland, the passage of a stringent law looking to the protection of game, etc., in Washington county, copies of which have been extensively circulated in the neighborhood of the Club grounds. It may be stated here also that a more stringent law against trespass and poaching was passed at the same session of the Legislature. From both of these measures the Club will be able to derive considerable advantage in the greater enjoyment of its legal rights. With a view to drawing and keeping game upon the estate, arrangements have been made for cultivating two or three lots of ground at different points during the coming summer. The crops to be put in are corn, beans, and buckwheat, the yield whereof will not be gathered, but left upon the ground as food for game of various kinds during autumn and winter. Up to this time nothing has been done, so far as can be learned, by the authorities charged with that duty, toward constructing the promised and much needed fishway at Dam No. 6. When this important work shall be done there is reason to believe that the sport of angling will be greatly improved at all points above the dam, both as to quantity and varieties of fish. In that event it will be possible for fish from below to pass that formidable obstruction, whereas under existing circumstances those which are carried or find their way over it during high water have no chance whatever of returning to their original haunts."

Fly-Fishing for "Hickory Shad."—There has been considerable excitement among the anglers of Baltimore (reports the Germantown *Telegraph*) over a novel impulse which seems to have seized upon the hickory shad—a fish which has hitherto been rated as extremely plebian. He comes into the rivers of Maryland above tide water this year as game as a salmon, and has been rising to the fly in a dashing style that has fired the Waltonian instincts of all true fishermen and carried them out with rod and reel in great numbers. The Patapsco, at the Relay House, Stemmer's Run, Bush River and other places where the salt tides do not come, has been alive with these hickory shad. It has always been customary with old gudgeon fishermen at this season to carry with them to the banks a cast of flies for a stray rockfish or striped bass, and a dip in the water often is rewarded with a strike, but hickory shad have never taken the fly before to any extent. Mr. John Donaldson, a few days ago, caught forty pounds of them. Mr. A. Dresel, on Monday, hauled in five splendid fellows, and others have met with similar luck. The only difficulty encountered in pursuit of the sport is the great number of early gudgeon fishers who line the banks, and who quarrel if their lines and corks are interfered with by an eighty-foot cast and two hackle flies. Those who have been catching the hickory shad in the Patapsco have been using small trout flies. On sunny days the gray or drab flies are the best, but on a cloudy day the "green hackles," "coachmen," or "professors" are about the most attractive on account of their bright colors. The shad rises to the fly with a little splash and takes it off with a fourteen-horse power run. He is hard to kill because his mouth and gills are peculiarly adapted to breathing with the jaws open.

Bass in Harvey's Lake, Pa.—The black bass (small-mouthed) have made their appearance near the shore in Harvey's Lake (this place), and there is promise of good sport during the season, as the fish are abundant and vigorous. They do not take the fly (but perhaps the right kind has not been used), and live bait only can be relied on in casting. Harvey's Lake is said to be the largest body of fresh water (I mean lake, of course) in Pennsylvania. It may be described as T shaped, the two lines forming the figure being two miles in length. Its width varies but little from about three-quarters of a mile. It is private property, but the owners do not deny the privilege of fishing to those who engage in it in a reasonable and lawful way and during the proper season. It is located in Luzerne county, about thirteen miles northwest of Wilkesbarre, and is reached by stage or private conveyance. The place is not much of a resort, owing, probably, more to ignorance of the people that it is such a delightful spot than to anything else, for it is cool and salubrious. I wish you to know that I am not after an advertisement gratis, as I am not a hotel keeper nor have I land to sell, but write to tell you of a place where your reasonable friends who are fond of fishing for black bass may have some sport. The Lake House has good accommodation for this country, and its proprietor, Col. James W. Rhoads, former sheriff of the county, will answer any inquiry as to accommodation, etc., by letter, or by telephone from Wilkesbarre.—T. G.

Black Bass in Ohio.—Cedarville, Ohio, May 22.—So far as I have been able to learn, there has been no change in our game law, though it was reported that a provision had been made to protect squirrels from Jan. 1 to June 1. This would, I believe, be too sensible a measure to emanate from our honorable body of legislators, and, though the proposition was before them, I understand it was defeated. There was a change in the fish law, but not, of course, for the better. How strange it is that the simple proposition to protect our black bass from hook and line, as well as every other means of capture, during spawning season, cannot be allowed to remain on our statute books when once there, nor re-enacted after its idiotic repeal. The provision which allows the catching of suckers and mullets in any way between March 20 and April 20, may justify the remark of a friend, who when told of it said, "Whoever enacted such a law as that must be a set of suckers themselves." At any rate I regard it as a fraud, under the cover of which black bass may be seined with impunity.—J. G. D.

Trouting in the Adirondacks.—A private letter from Gen. R. U. Sherman, of the New York Fish Commission, dated Bisby Lake, May 19, contains the following, which we have been permitted to publish: "The season here is sour and backward. The leaf buds are scarcely visible on the trees, and the waters are cold and high. We take what trout we need for the table by diligent fishing toward nightfall only. I doubt whether there has been any really good fishing yet on any of the lakes in the Wilderness. The running streams are much too high for brook trout fishing. I heard of one good landlocked salmon taken on Woodhull last week with a worm bait. The fish taken are dark-colored and slimy, indicating that they have just come from deep water and have not cleaned yet, as is their custom, on the sands. The great body is yet in deep water, and probably will not move until the minnows run to the shores. I saw many freshly-hatched caddis flies yesterday. No black flies or mosquitoes yet."

What Fish is This?—A correspondent writes: I have just returned from fishing the Macedonia Brook, in Kent, Conn. In the stream I found large numbers of fish about two to five inches long, something like trout, but with sharper noses and forked tails, they are splashed with red, not spotted like trout. Are they young land-locked salmon? I hear such were put in the stream a year or so back. You can judge of their numbers as I put back forty-two in an afternoon's fishing; but understand the folks that way count all fair and basket them. The little rascals took a fly furiously, and jumped time and time again after being hooked. [As salmon and landlocked salmon are black spotted, and have neither red spots nor splashes, we do not recognize what fish these can be. Perhaps these were rainbow trout, but the sharp nose and forked tail seems to forbid the supposition. Without specimens we cannot decide on the species.]

A California Salmon in the Mohawk.—Capt. L. A. Beardslee, U. S. N., has informed Prof. Baird that a California salmon was taken in the Mohawk River near Little Falls, N. Y., some time about May 16 to 20. We have no further information on this subject, nor has Capt. Beardslee or Prof. Baird. The former obtained his information from a newspaper slip which came into his possession. We would like a description of the size of this fish, its capture and by whom, and also of the disposition made of it.

Coast Fishes.—The bluefish have struck in from New Jersey to Cape Cod simultaneously instead of gradually going north, in great numbers. Weakfish are becoming plenty below New Jersey. Kingfish are in the markets in fair numbers. Menhaden are swarming at the eastern end of Long Island and along the coasts of Connecticut and Massachusetts in numbers exceeding that of any previous year within the last fifteen or twenty. All things point to a good season for the salt-water anglers.

Trouting in Chenango County, N. Y.—New York, May 26.—Will one of the many readers of the Forest and Stream inform me if there is any trout fishing near Greene, Chenango county, N. Y.?—Niagara.

Michigan Bird Arrivals.—House wren first observed May 12. Ruby-throated humming bird first seen May 18.—K. (Central Lake, Mich.)

Fishculture.

THE AMERICAN FISHCULTURAL ASSOCIATION.

The President called for Mr. Sweeny's paper which had not arrived. The next paper on the programme was then read; it was entitled:

Fresh and Salt-Water Hatching at Cold Spring Harbor.

BY FRED MATHER.

The new station of the New York Fish Commission, designed for hatching both salt and fresh water fishes, is situated on the north side of Long Island, thirty-two miles east of New York city by railroad. The harbor was formerly a whaling station, and many old buildings connected with that industry still remain there, unoccupied. The line between the counties of Suffolk and Queens runs through the center of the harbor, and while the village and post-office is in the former county, the hatcheries are in the latter. There are two points of especial excellence in the site which will at once commend it, and these are the elevation of the springs, one of which is fully fifty feet above the hatchery, and the proximity to salt water, which at half tide is only two hundred yards away.

The work at the station was begun on January 1, 1883, by the joint operations of the United States and the New York Fishery Commissioners, and has been continued by both Commissions since. The grounds were given, rent free, by Mr. John D. Jones and his brothers Townsend, Samuel and Edward, and the upper spring by Dr. O. L. Jones, and, in addition to this, Mr. Townsend Jones has given stone from the Connecticut quarries to build a sea wall to hold the tide at all times. Two old buildings have been fitted up as hatcheries, and the work done in the short space of time will bear close inspection and comparison with older establishments. Maps of the grounds will be found in the last report of the New York Fish Commissioners by those who care to know more of the station.

In the fresh-water department the present capacity of the houses has been nearly taxed by the hatching of 500,000 salmon, 10,000 landlocked salmon, 38,000 rainbow trout, 50,000 European trout and 1,000,000 whitefish. The fact that the European trout were in five different lots, which will be enumerated further on, rendered it necessary to place them in separate troughs, even though as small a lot as 2,000, taken from one English stream, were kept separate in a trough which could just as well have accommodated 30,000. The whitefish table will hatch 4,000,000 as well as 1,000,000, so that at present we can say that the capacity of the hatcheries is 800,000 salmon and 4,000,000 whitefish, or 1,000,000 salmon and the whitefish. This can be increased, if necessary.

TROUT.

Our native brook trout were formerly plenty in the ponds on this place, but owing to a lack of protection, they were very few when the land was leased to the Fish Commission; about fifty fish being the extent of their number. Eggs of the rainbow trout have been received from three different places, viz.: Direct from the U. S. hatchery at Baird, Shasta county, California; from the U. S. station at Northville, Mich., and from the New York station at Caledonia. They have grown well, but are a fish that I have never fancied much, and am in greater doubts as to their value since reading the last report of the New York Fish Commission, which says:

"A good deal is to be learned yet respecting temperature and other local conditions affecting fish. Till the past year not enough had been done in stocking with rainbow trout to warrant a judgment of their ultimate success in waters on the Atlantic side. Their time of spawning occurring at a different season from that of the native brook trout, it would not seem to be policy to plant them in waters inhabited by that fish. The protective seasons would need to be different, and inhabiting the same waters one kind might be taken often when the other was fished for, and thus unintended violations would be liable to occur. An obstacle to their ready success in our waters presents itself in the circumstance that at the season the fry are ready to plant, all other fish are greedily feeding, and consequently a considerable share of the fry are liable to be nipped in the bud. This, however, may be avoided by providing places where the fry can be free from the presence of predatory enemies till they are able to look after their own safety.

"From the circumstance that they have not been readily found always, in the second year, where the plants have been made, it has been surmised that they are a migratory fish—working their way, as soon as they attain any considerable growth, down stream toward the ocean. Their disappearance, however, may be accounted for by the other cause stated. Further experiments will be necessary to solve all the problems connected with their establishment in Eastern waters; but the promise continues to be that they will prove themselves a fish of great value in stocking large streams whose temperature is too high for brook trout."

An editorial note in Forest and Stream of May 1 says of the rainbow trout:

"We would call attention to the paragraph in our notice of the report of the New York Fish Commission concerning these fish. It is beginning to be learned that they are migratory, and do not remain in brooks. We have never been much in favor of this fish, because we have known, what is not popularly known, that the fish is strongly suspected to be a salmon. There is no difference that an ichthyologist can find between the *Salmo iridea* and the salmon known as 'steelhead,' 'hardhead,' and 'salmon trout' on the Pacific coast, the *Salmo gairdneri*. Although this is the case, and the species *iridea* is a doubtful one, yet it has been thought best not to combine them for the present. We have been waiting and watching the habits of this alleged trout with great interest in order to learn if its habits might not show it to be in some respect different from the steelhead. The evidence of the Commission tends to show that it is a migratory fish, and if so it may escape to sea and be lost, as the other California salmon was. We believe that Mr. Roosevelt has not seen the rainbows which he planted in streams emptying into Great South Bay, Long Island, since they were yearlings."

If this fish has to be confined by screens to prevent its migrating and perhaps entirely disappearing, as the quinnat salmon did, then it will be useless in our open brooks. The promise of the rainbow trout was that in it we had a quick growing fish, which was not as sensitive to warm water as our own *fontinalis*, a desideratum which now promises to be filled by the brook trout of Europe, *Salmo fario*. I would here call the attention of the Association to some specimens of this fish, which jumped out of the ponds last October, when they were six months old. They are, as you see, full six inches long, and are plump, handsome and finely formed. The eggs from which they came were sent to me as a personal present last year by Herr von Behr, president of the Deutschen Fischerei Verein, one of the most earnest and enthusiastic fishculturists in the world. Two varieties were sent, one from the deep waters where they grow large, as in our Maine lakes, and the other from the swift mountain streams of the Upper Rhine, where they are smaller. This year he has repeated his gift by sending some to the United States Fish Commission, in my care, and some to Mr. E. G. Blackford, Commissioner for New York. Last year, when the fish were sent to me personally, I gave some of them to Mr. F. N. Clark, Superintendent of the U. S. Station at Northville, Mich., and to Mr. M. A. Greene, of the New York Station at Caledonia. Both report them as doing well.

This year I repeated these divisions of the German eggs and also received ten thousand eggs of the same species from Mr. R. B. Marston, editor of the *Fishing Gazette*, London. Five thousand of these were labelled "our best trout," 3,000 were from the Itchen, and 2,000 from the Wye. Both last year and this season the large German trout have hatched well but have died freely before taking food, while the small variety has thrived and been distributed to waters not named in this article. The large English trout have done splendidly and will be kept at the station for breeders. This European brook trout has, as you may see, a larger scale than ours, and to my eye is a more beautiful fish than our own trout. It is a fish that from its habit in Europe should live in the Hudson from North Creek, or above, down to Troy. In Europe it is found plentiful in the South of England, while the charrs, of which our so-called trout is one, are only found in the deep cool lakes of the North. I believe that we have the necessary conditions on the Atlantic coast to successfully acclimatize this fish, and I have always been skeptical about habituating the *Salmonidæ* of the short streams of the Pacific coast, with their snow-fed waters in mid-summer, to our longer and warmer rivers, and this skepticism has increased since I have suspected the so-called rainbow trout to be identical with the steelhead salmon, *S. gairdneri*, which is a migratory fish.

WHITEFISH.

The great surface exposure of the reservoir at this station is favorable to the late hatching of the whitefish. The temperature of the water in the hatchery for the month beginning February 23 and ending March 23, varied from 34 degrees to 48 degrees, the mean being 38¼. Shipments of whitefish were made this year to Great Pond near Riverhead, Long Island, on Feb. 15, and to Lake Ronkonkoma on March 19. This is as late as the fish are hatched in the cold lakes, and the young will find food when planted in March.

THE SALT WATER WORK.

The cold weather caused us to suspend out-door work before the completion of the great tidal reservoir, but we were enabled to hold the water as high as half tide and to begin work. The hot air engine worked very well and we hatched the eggs of the little tomcod (*Microgadus tomcodus*), locally known as "frostfish" in the fall of the year, and as tomcod in the spring. I sent some of these eggs to Prof. T. J. Ryder, at the Central Hatching Station of the United States Fish Commission, and he hatched them in artificial sea water. The spawning season of this fish is in November and December, and they had finished spawning before our engine was in position, but we gathered the eggs from the seaweed, to which they are attached in bunches of the size of a hen's egg, and are easily obtained by the oystermen when raking for oysters.

We also obtained several million codfish eggs from the cars at Fulton Market, but none of them were good. They showed the shrunken vitellus which gives both them and shad eggs a "speckled" appearance, which indicates that there is no possibility of impregnating such an egg. In every case the parent fish had been brought in the well of a fishing smack, and after being dipped out had been thrown into the floating car alongside, falling from four to six feet, usually on the abdomen. This, in my opinion, is more than the delicate cod egg can stand.

The membrane, or shell, covering the egg of the codfish, is so delicate that a light touch of the finger, when the egg is on any hard substance, will burst it like a soap bubble, while a trout's egg will bear the hardest squeeze that can be given between the finger and thumb. It is possible that the eggs will have to be obtained from the fishing grounds and be taken when the fish are first hauled in, although they may possibly be found to be good after the smacks arrive and before the fish are put in the cars.

POSSIBILITIES OF THE STATION.

In addition to the salt-water fishes mentioned it is possible to hatch many other species. The density of the water varies

from 1.018 to 1.022, sea water being 1.023 and distilled water 1. The temperature of the water in the hatching jars has, during the months of January, February and March, varied from 33 to 48 degrees Fahr., the mean being 42¾. The water is clear and pure, and everything seems to be favorable for doing much good work. Spanish mackerel and other valuable fishes may be attempted, while in the opinion of Prof. H. J. Rice, the situation is most favorable for oyster culture. The harbor is part of the celebrated Oyster Bay, and oysters and clams are usually abundant and excellent. The past year, however, has not been a good one for either of these products, but the difficulty, whatever may have been the cause, is probably a temporary one.

It is to be hoped that the State of New York will adopt some such system as Connecticut has and which is now in good working and is giving general satisfaction, and in addition begin experiments looking to the production of seed oysters. At a comparatively small expense these experiments can be conducted on the grounds at Cold Spring Harbor, where the machinery for pumping salt water is now in position, and where the situation is favorable for making such ponds as may be necessary.

The experiments of the gentlemen who have devoted their time to the impregnation of the eggs of the oyster have proved that they can be fertilized and hatched in laboratories, and there seems to be no obstacle to the work being carried on, in a suitable location, on a larger scale.

THE MENHADEN QUESTION.

Editor Forest and Stream:

Your Westport correspondent quotes the old adage that a liar is not believed when he tells the truth. By that rule he is in bad repute, for he makes the following inexact statements in his article:

First—That thousands of barrels of menhaden are salted for mackerel bait.

Second—That there was unusually bad weather during the spring of 1883.

Third—That menhaden are decreasing; for it is a matter of record that the greatest scarcity of menhaden ever known was about twenty-five years ago.

Fourth—That there has been a diminution of five hundred purse seines since steam fishing came in vogue, for the reason that less than three hundred were in use at that time.

Fifth—By saying that menhaden are food for mackerel.

Another illustration in favor of free fishing is furnished by the abundance of porgies and sea bass this spring. The large porgies have been absent since 1868, and the sea bass even longer, but they are back again in quantities equal to any other year in the business.

Providing you or any of your readers wish to know quantities and prices of said fish, we invite your inspection of our accounts with Sam. B. Miller and Dudley Haley, Fulton Fish Market, for the month of May, 1884. If you do, you will find it even beats the following, which I cut from the Boston *Herald*, bearing date of May 24, 1884:

"Fresh fish of all kinds are very plenty, and the market is dull, with prices low. Large cod sold yesterday at $1 to $1.50 per cwt.; market cod, 75c. to $1.50; haddock, 75c. to $1.50, with a large supply. There are no hake or cusk here. Choice split pollock sold at,50c. per cwt. Fresh mackerel range from $2.50 to $4.50 from the vessel. Halibut are plenty and very cheap. New shoals sell at 6½c. per lb., and bank at 5c. Shad have been selling at 10c. for bucks, and 20c. for roes. Salmon are easier, and good eastern can be had at 34c. per lb. There is very little doing in oysters, as the season is over. The trade now is confined to restaurants and hotels. Clams are in good demand at 50c. per gal. for shucked. Lobsters sell at 8c. for boiled and 6c. for live. A down-east schooner yesterday brought 6,000 live lobsters." DANIEL T. CHURCH.

FIXTURES.

BENCH SHOWS.

June 10, 11, 12 and 13.—The Second Annual International Bench Show Chicago, Ill. Mr. Charles Lincoln, Superintendent.

Sept. —.Bench Show of the Philadelphia Kennel Club. Mr. P. C. De Saque, Secretary.

Oct. 8, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 14.—Non-sporting Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Charles Lincoln, Superintendent.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1213.** Volume I., bound in cloth, sent postpaid, $1.50.

DACHSHUNDE.

Editor Forest and Stream:

It has appeared to me that either dachshunde should not be admitted into any American bench show, or else that a proper classification should be made, the three distinct breeds recognized, and the judging done by persons familiar with the dog in its own country, not by persons who have received their practical education in this line by studying the mixed lot that pass as dachshunde in this country. I make these criticisms because I have become astonished at the bewildering maze of incongruities that seem to hover around the decisions of the judges when the alleged dachshunde are brought into the ring. Now this is how the matter stands at present with those who are the friends of the dachshund: The uncertainty whether the terrier, hound or Hanoverian spielhund is considered by the erudite judges as the type of dachshund to set up as a criterion. Of course, if it is distinctly understood that only the hound type is to be considered, or the terrier, or whichever of the three the judges decide upon, owners will know what to do and what entries to make.

To give you an example of how this uncertainty makes us afraid to enter imported dogs otherwise than those with which the judges are familiar with here. In New Haven there were only two dachshunde, properly speaking, these were two distinct types. One a Hanoverian spielhund, from the Royal Kennels, and a first prize winner in puppy class in Berlin, 1883—a type of dog only found in Hanover and valued very highly by the Germans. The other entry was a good specimen of the ordinary tekel, a dog that can be picked up for a few dollars anywhere on the continent. Now this dog, Scamp, took first, while the Hanoverian type was not recognized as a dachshund. This was satisfactory to the owner, he supposing that the judges in this country did not recognize the dog as belonging to the dachshunde. What was his surprise upon afterward hearing that the judge had never seen the spielhunde.

Now to come to the point: In New York there was not a single full-blooded dachshund. Gretchen, the first prize winner, was a beautiful specimen of the Hanoverian type, but the same type that had been refused at New Haven. Now what I want to know is, how are we to tell what the judges consider dachshunde? If they would only establish at least two classes, they would see fine exhibits, and be released from a sense of knowing that all lovers of the dachshunde in this country only look upon them with pity and uncertainty. Supposing now that there had been a good entry in the class in New York, it would have been a gross error to have neglected Gretchen, yet you would have been obliged to have neglected the dachshunde proper or else Gretchen. I heard the judge at New Haven tell the owner of Scamp when he pulled up his skin some four inches from his back that it was a shame to starve the dog so. Do you think that he thinks much of the prize awarded through such a judge of dachshunde? AUFWIEDERSEHEN.

HARTFORD, CONN.

MR. F. E. LEWIS'S LEMON AND WHITE ENGLISH SETTER DOG "ROCK."
Winner of First Prize, Open Class, New York, 1884.

NATIONAL BENCH SHOW ASSOCIATION.

Editor Forest and Stream:

I inclose you a copy of a circular sent by the Westminster Kennel Club to the foremost kennel associations of the country.

The importance of concert in dog matters should be recognized by all and it is hoped that the meeting will be fully attended and may result in the establishment of a national association of kennel clubs which may take the position in America filled abroad by the English Kennel Club.

ELLIOT SMITH.

[CIRCULAR.]

Gentlemen:

You are invited by the Westminster Kennel Club to attend a meeting of American kennel clubs, which will be held at Delmonico's, Twenty-sixth street and Fifth avenue, on the 21st day of June, 1884, to discuss the propriety of uniting in a general association with the object of securing uniform rules for the conduct of bench shows, adoption of standards, consideration of protests within certain limits, and such other kindred matters as may be submitted.

ROBERT C. CORNELL, Secretary W. K. C.

NEW YORK, May 24.

BEAGLES AT NEW YORK.

Editor Forest and Stream:

In your last issue appears an article on the above by Mr. N. Elmore, in which he says: "I presume the Westminster Kennel Club see the mistake they made by accepting a different judge to make awards in special prizes for beagles," that he don't believe it was the desire of the Beagle Club to have a separate judge, and asks me who made the nominations for judges. Some time before the standard was adopted by our club (it being then in the hands of the committee, of which Mr. Elmore was one), some of the executive committee of our club wrote to me saying that we ought to have a proper judge at the New York show; one who understands and knows what a beagle ought to be. I replied that I fully agreed with them, but we had better wait until the standard was adopted by the club, so we could ask to have the judging done by it. As soon as the club adopted the standard (the time for action being limited), I nominated four members of the club, who were fully capable for the position of judge—Mr. J. N. Dodge of Michigan, Dr. J. W. Downey of Maryland, Mr. F. D. H llet of Connecticut, and Mr. Louis D. Sloan of Pennsylvania, to represent the West, South, East and Middle States; and sent out the postal card of which Mr. Elmore speaks. I then wrote to the Westminster Kennel Club, asking them if they would appoint as judge one of our members who would be elected (Mr. Sloan was duly elected notwithstanding Mr. Elmore did not vote). They replied that they had already appointed the judge for beagles, but would allow Mr. Sloan to award the special prizes donated by the club. I consider I had the authority to make the nominations by Article I. of the by-laws of our club, and also in carrying out the objects of the constitution by Article II., which reads: * * * "also having proper judges selected at our bench shows." I was unaware that the Westminster Kennel Club had appointed Mr. Mortimer until their reply to my letter. I was carrying out the object for which we are organized. It was no mistake of the Kennel Club to have the special prizes awarded by a beagle judge and member of the club and by the Beagle Club's standard. The Beagle Club, I am sure, did not donate special prizes to be awarded by any other scale of points than those adopted by them as the standard. Are we to go backward and have the mistakes made, as has been done in the past? If so, there was no use of our uniting or organizing our club. I refer Mr. Elmore to the preface of the standard, which says: "The necessity for a descriptive scale of points for this breed is very apparent * * * quality being overlooked or ignored. * * * With an accepted standard the judge will have a guide to lead him through the difficulties of his position."

I heartily agree with Mr. Elmore in hoping that all bench show managers will have only one judge, and that one appointed from among the many capable members of our club, and the judging done by our standard. If it is not it will be the fault of the club. I did my best to have it done at New York and will elsewhere. Mr. Elmore says: "Mr. Mortimer's judging was consistent * * * and had the dogs placed right." I ask Mr. Elmore if he considers the dog Frank, which won first in the open class, a beagle or not. I should like an answer to this question, yes or no, for if he says he does I will have something more to say. If he don't consider him such, how can Mr. Elmore indorse Mr. Mortimer's decision and at the same time accept the standard of our club (he being one of the committee to draft the same). He will have to accept one or the other *in toto*. He cannot do both, as Mr. Mortimer did not judge by the standard, as will be seen by his award in the case of Frank. I cannot think Mr. Elmore wishes to ignore all our efforts in having formed a beagle club and in trying to improve on the old style of judging, but it looks very much that way when he finds fault with a judge who made his awards by the standard of our club. I am pleased if Mr. Elmore has a better bitch than Deborah. But leave that for the opinion of others. W. H. ASHBURNER,

President American English Beagle Club.

[Mr. Elmore writes that the following sentence in his remarks of last week should have been quoted, being the opinion of another writer and not his own: "We regret that Mr. Sloan, the judge for the Beagle Club's prize, should have reversed Mr. Mortimer's decisions, irrespective of the fact that Mr. Mortimer had the dogs placed right."].

POINTERS AT NEW YORK.

Editor Forest and Stream:

I shall take Mr. Mason at his word when he says in his letter of May 19, that he will be "pleased indeed," if any one can show errors of judgment in his criticism of pointers at the New York show.

I do not propose to criticise Mr. Sterling's awards, I only want to have my say about some of the well-known pointers exhibited.

First—As to the champion class of large dogs, Meteor, in my opinion, was far and away the best of the lot. I had him out and carefully handled him before he went into the ring. His one important fault is that his head is not handsome. There is almost no stop below the eyes and little depth of skull. In back, loin, legs and feet he is extremely good—such a dog as ought to make an untiring worker in the field, *ergo*, such a dog as I want to see noticed at a bench show. My idea is that we don't want a dog for the bench and another for the field, but a dog for bench and field.

Mr. Mason says Knickerbocker is a better type of dog than the winner. He may be a better type than the "plain dog," but he surely is not a better pointer, and simply because he is, to quote Mr. M., "faulty in back, stifles, tail and neck," beside these faults he is cow-hocked.

Don, to be sure, is a trifle coarse, but he is withal a capital pointer, and I would sooner breed to him on account of his excellent pedigree than to any dog in the class.

Beaufort is, to my mind, not nearly as good a pointer as Meteor, and for the following reasons: His legs are extremely bad, being crooked both fore and aft, his pasterns are bent in so that the dog is actually bow-legged, and his hocks are likewise also bent. I think the criticism applied to Meteor by Mr. Mason would much better fit Beaufort. "He is too long on the legs, and if followed behind when on the chain he will be found to be 'stilty.'" Add to this a very heavy throat, and Beaufort is found lacking in points which are absolutely necessary to make a dog first-class in the field, and he ought not, therefore, to be rated first-class on the bench. On the other hand, the dog has a very good head, a beautiful coat, a good body and a wonderfully fine stern—I had almost said it was an unnaturally fine stern.

As to the statement that Bravo should have beaten Bang Bang: Bravo is better in just one point—he has better hocks. In all other points Bang Bang is immensely his superior. Bang Bang is the most strikingly handsome pointer dog in America to-day. His shoulders are such as no other pointer I ever saw is fortunate enough to possess, and if he proves as level-headed as I think he will, the W. K. C. will have what they have always had in view, viz.: a dog fit to compete and able to hold his own in any company, both on the bench and in the field. ROBT. C. CORNELL.

Editor Forest and Stream:

In your issue of May 22 appeared a lengthy criticism of the judging of pointers at the New York show from the pen of Mr. C. H. Mason. A few days later the manager of my kennel handed me the following note addressed to him by the same gentleman:

DEAR SIR—A protest—indorsed by fifty exhibitors and breeders of pointers—is to be published against the absurd decisions at the late N. Y. show. The protest is already signed by many of the most influential breeders, exhibitors and clubs.

May I add yours or those of any of your friends, who do not wish to see the grand pointer degenerate? Very faithfully,

CHAS. H. MASON.

No. 49 West Twenty-fourth Street, New York.

As Mr. Mason knows me to be a member of the Westminster Kennel Club, this appears to me questionable taste, and as unfair to place my employe in so equivocal a position, against which I object in his behalf.

As to Mr. Mason's criticism, I have had too little time and opportunity during this show to know whether he is right or wrong in all the cases he mentions. I shall therefore confine my countercriticism to the few dogs which I have known for years, both on the bench and in the field, simply to show that no judge can see everything, and even Mr. Mason can be mistaken.

Let me begin, as the fittest subject, with Fan Fan, my own

exhibit, in the heavy pointer bitch class, whose faulty form is so evident even to a novice, that nothing but the knowledge of the general worthlessness of this class in years past, could induce me to exhibit her at all. I relied on the unusual quality in so large a bitch to carry her well to the front, and was not mistaken. She was easily beaten for first by the only one in the class pretending to any form at all, though as a brood bitch I think it much easier work for me to correct Fan Fan's faulty frame than to infuse good or high quality into the winner.

To digress for a moment: It is a fact that nearly all large pointer bitches exhibited in this country for many years have been coarse and short of quality (my definition of quality being the greatest strength in the smallest weight, which necessitates fine bone, fine fiber and fine texture throughout). I have a horror, not of size, but of coarseness and lumber.

Whether this coarseness is due to the use of all sorts of native bitches and the fact that mostly dogs are imported of the highest class, is of no consideration just here. The truth is that the highest quality is found in the smaller bitches and, as Mr. Mason states, the best results, at least for the bench, are obtained from breeding large dogs to the small bitches. But is this any breeding at all? I call it mating. The breeders are those who will keep up the separate strains of large dogs and small bitches, as long as a distinction is made, in order to enable the exhibitor to produce the happy medium. I do not believe in hybrid nor grades of any kind unless I can perpetuate them and make them a breed. Hence, I would advise either to abandon the large pointers as a breed or to improve their quality. That the latter is possible is evidenced in Fan Fan, who has little else to recommend her. But to return to Mr. Mason's criticism of her; he writes: "Fan Fan (Donner's), placed second, has a fair head and tolerably good feet." My judgment is that she has a good head (including lips, eyes, ears and skull), but has intolerably bad feet: in fact, I think a rooster has better feet, at least for the purpose of sitting on the fence. Mr. Mason continues: "Faults, throaty." I claim her skin fine as a mole's, fits her like a kid glove from the tip of her nose to the end of her tail. His next utterance—"wide in front"—I might have written myself, so well do I agree with it; but when he continues—"light in bone"—I again hold another opinion.

The bitch has all the bone she wants. In fact, I never heard of dogs breaking bones except between their teeth. I wish they were all ivory and as light as possible. A really big bone is the surest indication of coarseness, sponginess and goutiness in any animal. I am sure Mr. Mason knows this, but uses the expression "light bone" to designate the leg as a whole, and I think we only disagree as to the quantity there should be of this, and claiming exceptionally high quality for Fan Fan, I disagree with Mr. Mason as to the quantity of leg necessary. The highest bred horses have apparently light legs, but the actual bone is of ivory density without core. The common horse has large bones of a spongy cellular material. The former is not only in itself the strongest, but especially so from the manner in which the tendons are placed at the greatest possible distance from the bone. These act as the cord of an arch and at double the distance give nearly double the strength to the arch. I therefore like a broad, flat or deep leg of fine bone, with the tendons set clean away from it.

In this respect, I do not only disagree with Mr. Mason in regard to Fan Fan, but conclude from his remarks made in praise of other dogs, that he prefers even an actually round leg and coarse bone, as long as there is plenty of it, to a really fine leg of ample strength.

I find that fine legs as a rule accompany fine tails (though both may be faulty in shape). A fine tail indicates a fine bone in the entire frame, and I conclude that it is due to the demand for too much bone in the leg which causes so many coarse tails and skulls in our large pointers. I can count every bone in Fan Fan's tail. Her skull is fine and her legs are in harmony with her general quality. Mr. Mason's last remark about Fan Fan, "too round behind the shoulder," I indorse only in so far as to say, "entirely too round underneath the shoulder," as I want a dog well sprung in the back ribs as soon as they are clear of the shoulders and elbows. After the above minute statement in regard to a single dog, I could offer my reasons for disagreeing in a number of instances from Mr. Mason's criticism, but for fear of offending owners shall take the liberty only in regard to some dogs owned by a personal friend.

These are Mr. Godeffroy's Drake and Sefton, and Mr. Mason writes: "Drake, placed second, was not entitled to the honor; it really belonged to his kennel companion, Sefton, a decidedly better looking dog; he beats Drake everywhere excepting in head and neck. Sefton is a little sour in expression and light in eye; he is also throaty, but he has good quarters and he stands on capital legs and feet." I do not wish to criticise Drake, except to state that in spite of his show form, good or bad, he can and does gallop as long as Sefton can trot or even walk, and he prefers to do so. What is the reason? I answer—coarseness and lumber in Sefton. In this he is so well balanced that at twenty-five yards distance he looks almost first-class. But don't go near him! You find besides the faults enumerated by Mr. Mason, a coarse muzzle and skull, thick ears, neck and beefy shoulders, with coarse, open hard hair all over to the end of his tail. What does Mr. Mason now see in him, except big legs and general symmetry to change his opinion about him? We agreed better on this subject when he criticised this same dog a year ago, quite as severely as I do to-day, and as I hope with Mr. Godeffroy's consent, who has long ago ceased to breed trotting dogs for field trial winners. Sefton is a well-broken field dog, but can be bought reasonably.

Mr. Mason cannot answer me by saying that my ideas of a dog are against the authorities. I think the difference between us lies in the different interpretation of the same rules, and here a difference in opinion may well prevail—at least I never found anything in the rules to prevent a good field dog to be also a handsome dog, but I know of many cases where bench winners turn out very poor movers in the field. This should not be so under good judging, and I doubt whether Mr. Mason is the only judge who will do justice to both Stonehenge and the dog.

J. O. DONNER.

NEW YORK.

N. A. K. TRIALS, 1884.

CANTON, Miss., May 19, 1884.

To the President of National Field Trials:

DEAR SIR—Knowing that the trials for the last year were held at Grand Junction, and knowing also that Canton is a superior place for such trials, we are induced to write this letter as directed by the members of our club. Canton is south of Grand Junction, 187 miles, on the Illinois Central Railroad; has 3,000 inhabitants, and has plenty of hotel accommodations for the visitors. It is 24 miles north of Jackson, at which point the Vicksburg and Meridian Railroad strikes. Its advantages geographically are excellent, but its natural advantages excel by far all other places. This was acknowledged by gentlemen who attended the New Orleans Gun Club trials here last fall after attending the trials at Grand Junction. They spoke in high praise of the open fields and number of birds at Canton. Our gun club has stocked with birds a body of land containing over three thousand acres within a mile and a half of Canton. This land already had plenty of birds on it, and before stocking it was no trouble to find twenty-five covies in one day. We have had the land posted; no one is allowed to hunt it, not even ourselves.

Now a few words as to its surface: Seven-eighths of these 3,000 acres is open level land, the rest is cover and not heavy cover. By our endeavors the Legislature last fall passed a law prohibiting trapping and netting of birds in this county, so that next fall birds will be still more plenty than hitherto. The people of our town are hospitable and will welcome cordially all visitors. The rooms of our club will be open to all. We feel sure that the National trials, if once here, will be always held at Canton. The New Orleans Gun Club trials will be held again at this point next winter. To sum up, we guarantee you 3,000 acres of beautiful ground within a mile and a half of Canton; more than plenty of birds on it, plenty of places to lay your heads, and plenty to eat, and we extend a cordial welcome as a club to the National field trials to come next winter to our town. We will do our best to so treat them that they will always smile a smile of gladness when the word Canton is mentioned. We refer you most respectfully to the following gentlemen who visited our grounds last winter to see the New Orleans Gun Club trials: Messrs. Wallace, President New Orleans Gun Club; Renaud, Secretary New Orleans Gun Club; J. Palmer O'Neil, Pittsburgh, Pa.; H. B. Harrison, Ontario, Canada, and the two judges at the trials, Mr. Thompson, of Louisana, and Capt. Key, of Florence, Alabama.

Yours very respectfully,

G. R. KEMP, Secretary. LAWRENCE FOOT, President.

CHICAGO DOG SHOW.

Editor Forest and Stream:

Beyond the regular prizes offered, medals will be given for the best kennel of five English setters, best five Irish setters, best five Gordon setters, best five pointers, best five Irish water spaniels, best five cocker spaniels, best five collies, best fox-terriers, best three bulldogs. Medals will also be given for the fastest greyhound or deerhound, also for making the highest leap, and a medal for the best trick dog, one for the best retrieving dog. A $10 silver cup for the best pug owned and entered by a lady. A handsome collar for the best black and tan toy terrier in the show, and one for the same kind exhibited by a lady.

The entries are coming in very well, and there is no doubt that the show will be a good one.

The entries close on the 31st inst., and should be sent in at once, addressed to me, P. O. Box 569. Should any intending exhibitor not have received their entry blanks, by sending the breed of dog they desire to exhibit, with the sex, color, age, and pedigree, their entries will be accepted.

CHAS. LINCOLN, Supt.

[Premium lists and entry blanks can be obtained at this office.]

THE ENGLISH FIELD TRIALS.

WE CLIP from the London *Field* a portion of its leading article upon the late English Field Trials, to which we append a letter from Rev. J. Cumming Macdona in reply:

"Within the past two weeks have been held the two great Field Trial Meetings, for pointers and setters of the year, neither of which can be said to have passed over under favorable circumstances. The first—that at Shrewsbury—will stand alone and unprecedented for the badness of the scent, hard, and cold east winds. A hot sun had parched the ground, cracking it in places, and as the wind lulled we had not even that help to enable the pointer or setter to feel the body scent. The second, at Stratford, is remarkable from causes almost exactly the reverse. There had been and was plenty of rain—and cold rain too—wind, and storm generally, and, although under such conditions we have at times seen the best of scent both for hounds and dogs, it was not so on the occasion of which we are writing. Possibly on the Friday afternoon scent was as bad as it had been the previous week, and only during two or three hours each day (generally early in the morning) did the conditions prove favorable for testing the scenting capabilities of the entries.

These trials have not yet become popular, and, though the attendance at the National Trials was fair, perhaps as large as it ever was, at the Kennel Club meeting it was moderate in the extreme, never exceeding some eighty people, and not more than a score and a half were present to witness the final trial between Ruler and Malt. The pointers, as a class, far out-worked the setters; they did this not only under the hot sun and dry ground of Shrewsbury, but were alike predominant under the rain and heavy going at Stratford. This is rather difficult to account for, especially with the fact staring us in the face that of late years the setter has enjoyed much the greater popularity of the two, and is far more extensively bred, especially for bench show purposes. At some of our later exhibitions the pointer classes have been sadly poor, while exactly the reverse was the case with the setters.

Then, of the latter breed actually competing at the two trials, there was but one Irish setter, and not a single specimen of the Gordon or black and tan; while as a rule those animals the most shapely, and having by blood and outward appearance the greatest pretensions to success in the prize ring, performed the worst of all, and, though they had style enough when they found game or backed the point made by their opponent, their noses and breaking were far below mediocrity. Can this be more than a coincidence? We are sadly afraid it is not. Perhaps we may be writing that which many people will consider a foul calumny on the present handsome race of setters, who, with coats and feather almost like floss silk, sweet and expressive countenances, straight legs, perfect feet, beautifully-placed shoulders and ears, loin and muscle not to be surpassed, are seen taking the cups on the show bench. Yet our experience of them has been just as it was proved at the recent trials—poor in the field, and not nearly equal in work to the common-looking little creature who, so far as show purposes are concerned, would not be worth sixpence. Many of our most successful exhibitors of setters have their shootings, and, as sportsmen, they shoot over their dogs, and are all loud in praise of their excellence in the field. Yet the handsome prizes given do not appear sufficient inducement for them to run the risk of a Crystal Palace or Birmingham winner having in the field its nose put out of joint by a dog not good enough to win at a public-house show in the north. Here are facts as they appear before us; we are shocked to find them, and they are not altogether creditable to those whom the subject most concerns. Of course we do not infer that the handsome setters have never won. There is one well-known kennel, which was not represented either at Shrewsbury or Stratford, that can be as successful in field trials as at Curzon Hall; but as a rule the facts are as stated by us. Now, so far as pointers are concerned there is a great difference, and if we have not actually had the handsomest animals winning, still they have been an advance in this respect on the setters, and generally throughout were a great improvement on them. There were half a dozen or more quite up to first-class show form which ran creditably, and somehow the handsomer a pointer was in ordinary appearance the better style it had on game, and usually had pace to boot. We must naturally come to the conclusion that just now, shows notwithstanding, our pointers are far better in the field than our setters, and nothing but practical proof to the contrary will convince us we are wrong."

Following is the letter of Mr. Macdona:

SIR—You are so often right, and so generally take a common sense view of things, I confess I feel some temerity in joining issue with you in your interesting article on the late field trials. You state they "have not yet become popular." Is this really so? Perhaps they may not be in the strict sense of the term "popular," because they are not, nor ever have been, attended by great numbers of people; but is this a true test of popularity? Consider the conditions. Those who attend field trials come, as a rule, from long distances. Whether they be owners of dogs competing, or keepers and trainers of dogs (I like the American term "trainer" better than "breaker"), both alike evince a keen and intense interest—sustained over several days, which I have never seen excelled at other competitions. A horse race or coursing match, with all the horrible and hoarse shoutings of the betting fraternity, rises quickly to fever heat, and the excitement is over in a few moments. At a field trial, what are supposed to be the best trained dogs meet, and in calm and collected manner do their level best against each other, racing in gallant form, yet with well-bred and well-trained dogs seldom outpacing their nose.

You state, "An unpleasant feature is the continued whistling, sometimes shouting, of the worker," etc. Now, Sir, if there is one change for the better more than another that field trials have effected, it is, I think, universally acknowledged that the deportment and manners of the keepers and trainers of the dogs has wonderfully improved since the establishment of field trials. I have attended field trials from their establishment, and have seen a vast change for the better, not only in the quality of the dogs competing, but in the men that work them. If field trials have "not yet become popular," how is it we never see a field trial fail for want of entries? That the public do not flock to them in great numbers may be easily accounted for. Proprietors of large landed estates, who generously give their ground to be worked over, do not care to have more of the public (especially where estates adjoin large towns that harbor many poachers) present than are supposed to have a direct interest in the dogs being tried. If field trials were to become "popular" in the same sense that race and coursing meetings are, the pristine purity of the privilege of attending them would be for ever gone.

If there is one charm that I cherish more than another in field trials it is the select circle of sympathetic spirits, gathered from all parts of the compass that, meeting in the open, trudge on through briar and bramble, over plough and fallow, through sunshine and storm, most earnestly intent upon the movements of the dogs, the keepers, and the judges. It is passing pleasing to meet there such true types of Irish sportsmen as Mr. King and Mr. Lipscombe, to meet Germans, Frenchmen, Belgians, Austrians, Italians, Dutchmen, and Americans come purposely over to attend them. Who that has met Prince Albert Solms, Von Gusted, Von Alvensleben, and other keen Continental sportsmen at our field trials does not feel proud of the prestige of our old English sports in being so attractive in their influence? But to my mind more than all this intense interest of distinguished foreigners and our own country gentlemen in these field trials is the keen appreciation of them by the backbone of all our sport, the game keepers and dog trainers of our country. Why, bless my soul; it is well worth a journey of one hundred miles by rail to go to a field trial to see one of the "bishops," when not occupied with deceased wife's sisters or pigeon shooting, "put down by the judges" to work against Anstey, Armstrong, Brailsford, Bret, Fletcher, Knowlton, Roberts, or Thomas. The keen yet silent zest with which they set to work is a caution to Convocation. To watch the way in which Bishop Elias, the archbishop of all the bishops, worked Ranging Aaron and Ranging Moses was truly unique if not strictly ecclesiastical; and when Ranging Moses turned a summersault in the air, as he pulled himself up in a headlong gallop when he spotted his competitor on a point, was one of the episodes of the late field trials that well deserves to be handed down to posterity along with the deeds of Garth's Drake and my champion Ranger. Though I have never hesitated in giving my opinion pretty freely about the faults of the Kennel Club, yet I am bound to do it the justice it deserves of commending its pluck and spirit in keeping up its field trials as it has done. Of course I know it is, and, as far as I remember anything of it, it has been, inconsistent in many things. Mr. Richardson's case seems decidedly hard and a direct violation of its own printed rules. It is still more inconsistent of the Kennel Club to shut out from its Stud Book Birmingham and Darlington shows, and yet admit the field-trial winners at the National Field Trial at Shrewsbury, who avowedly repudiate and ignore both it and its rules. I agree with you that it is a great pity we do not see more Irish setters and Gordon setters at the Field Trials. If Col. Starkie would compete next time, we would, I think, see a rare team of genuine Gordon goers from the far-famed Huntroyd Kennels. If Lord Lovat, Lord Roslyn, Sir John Clark, and other well-known breeders of Gordon setters would only have the pluck to try their dogs at field trials, the public would, I think, be delightfully astonished to see what the handsome, well-bred Gordon can do.

Hilbre House, West Kirby, May 13. J. CUMMING MACDONA.

THE WINNING POINTER PUPPY AT SHREWSBURY.

Lingo, the winner of the National pointer puppy stake at Shrewsbury, is the daughter of the Westminster Kennel Club's Bang Bang. The following description of her from *Land and Water* will be read with interest:

"Lingo, the property of Mr. C. H. Beck, was the actual winner. She is, with the exception of a very slight lemon marking of the faintest shade on the ears, pure white in color. Her sire is Bang Bang, the winner of this same stake two years ago, and she is thus the daughter of a field trial winner, and is one of a long line of winners having their foundation in one of the grandest pointers of modern days, old Devon Bang. The dam of Lingo is Polly, a bitch that is nearly related to Sir T. Leonard's Priam on his dam's side. Lingo is rather on a small scale, but there is little room to find fault with her in her make and shape. She is built on very much the same lines as her sire, Bang Bang, her head in particular looking as if cast in the same mould. She has a fair amount of bone, straight limbs, good chest and fore quarters, is fairly well ribbed up, has wide loins and well-bent stifles. Her pace is good and her action is capital, both before and behind, but she seldom extended herself, pottering about at times in a most aggravating manner. She carries her head but indifferently, and few people who witnessed her earlier heats took her chances of winning into consideration, so remote did they seem; indeed, we doubt if her breaker thought much of them himself at first. The weather make the trials very "fluky," so that any dog which did not actually commit the gravest of faults was always 'in the race.'. In this case the extreme carefulness of the bitch stood her in good need. The scent being so poor, a free-ranging dog, carrying his head as she did, would have been certain to flush frequently. On a fair scenting day, a dog even with a moderate nose only, but that carried his head well, would give her little chance unless she altered her tactics. We do not, however, wish to detract from the merit of her win, which on the whole she deserved."

CURRENT DOG STORIES.

XXX.

There is sorrow in the Fifth street police station. Jack, a nondescript, four-footed member of the force, is under the care of a surgeon. He limped into the station a few nights ago, and mournfully lay down near the stove. One of his forelegs was broken, and he was suffering from internal injurics. His recovery is doubtful, but his friends think his strong constitution and tenacity will pull him through. Jack, like Moses and other great characters, has no surname. He was born in the Fourth ward, and passed his early years in the pursuit of the quiet-orbed, tortuous-horned goat, and the contents of eating-house ash barrels. After three years of suffering he was adopted by a citizen who passed most of his time in an Allen street barroom. The citizen died, and bequeathed Jack to the barkeeper. One night a drunken man kicked at Jack as he was coming out of the barroom. Jack dodged, and the drunken man's toes struck the door jamb with painful violence. The man, angry beyond control, ran after Jack until a policeman interfered with his hostile intentions by arresting him. Jack followed the policeman and his prisoner to the station. When the policeman returned to his post Jack went after him, and refused to be driven away. At night Jack returned to the station and was formally adopted by the force. Jack has been in the habit of sleeing in the station during the day. He leaps up from behind the stove when the gong sounds for the 6 o'clock relief to assemble. When the men are drawn up facing the Captain, Jack places himself solemnly in front of them. At the Captain's order, "present arms," Jack barks. He then selects a policeman from the ranks and follows him out. He remains with the policeman until the roundsman comes along, and he then transfers his attention to the roundsman. He has assisted in capturing thieves, in driving noisy crowds from corners, and in protecting property. He was once left at the entrance to a basement in which there was a slight fire, while the policeman turned in an alarm. Jack refused to let the owner of the basement enter until the policeman returned. The bartender who formerly owned Jack captured him, and tied him up in the barroom. When the time came for the midnight relief to go out Jack began to howl. He continued howling until morning, when the bartender, who had been kept awake all night, gave him to the driver of a brewery wagon. The driver tied Jack in the wagon and drove to the brewery. A roundsman from the Fifth street station happened in the brewery and saw Jack tied to a post. Jack emitted a wild bark of recognition and delight, leaped up on his hind legs, broke the rope that bound him and ran to the roundsman. Since his injury Jack has made several efforts to go out with the midnight relief,

but he has suffered so much that he could crawl only a little distance. As he sees the last man disappear through the doorway he sets up a mournful howling.—*N. Y. Sun.*

XXXI.

Domestic animals are turned to curious account in some parts of the world. For instance in Spain a small dog is often used by housekeepers for turning the spits before the fire; and it is not at all to be wondered at that he doesn't take kindly to such employment. To say nothing about the heat of the work, it must be a terrible temptation to the poor animal to keep from touching the meat and fowls, which he would much sooner eat up in a raw state than assist in roasting for the consumption of others. A gentleman who traveled once in Spain tells the following amusing story, in which he gives the little turnspit dog credit for a wonderful amount of sharpness. One evening I reached a solitary little inn. Close to the stove lay a dog warming itself in comfort. "What can you give for dinner?" I asked the landlady. "Some eggs," was the reply, and the dog looked fixedly at me. "Eggs," repeated I. "That's poor sustenance for a man that has come thirty miles on horseback. Have you nothing better?" "There's a bit of bacon." suggested the landlady; and the dog looked at me more intently than ever. "I'm not passionately fond of bacon." replied I; "what else have you?" "Santa Anna," cried the landlady, "I can give you a chicken!" At these words the dog jumped up and sprang through the half open window. "Good gracious!" said I; why the word 'chicken' was like a bombshell to him?" "Ah," smiled the hostess, "it's because he turns the spit."—*Chicago Inter-Ocean.*

DEERHOUND CHALLENGE CUP.—*Editor Forest and Stream:* A New York gentleman has expressed his intention of giving a challenge cup, to cost $250, at the shows next autumn and the spring of 1885 for the best kennel of deerhounds, subject to the following conditions: This cup to be competed for only at shows where at least ten deerhounds (dogs and bitches) are entered in the open class; a champion (winner of three first prizes at shows where a first prize has heretofore qualified the entry of the same dog in the champion class at the Westminster Kennel Club's shows), not to be eligible as an entry making one of the ten requisite in the open class, but eligible to compete as one of a kennel; three entries, either all dogs or all bitches or dogs and bitches, to constitute a kennel; cup to be the property of the kennel or individual winning it three times. The cup will be on exhibition at those shows where the foregoing conditions are in force.—CLOVERNOOK KENNEL.

SIMON CAMERON'S DOG.—Last December a fine Newfoundland dog, which had been presented to Simon Cameron by a friend, was stolen in Harrisburg. It has just been ascertained that the thief sold him in York, Pa., for $5, stole him again, and sold him a second time. The Harrisburg Chief of Police has gone to recover the dog.

ONE MILLION OF MEN have held the accident policies of the Travelers, of Hartford, Conn., and *one in nine* have received cash benefits on them.—*Adv.*

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, or breeding or date of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Don Glencho, Madge Glencho, Sultana and Lady Fire Fly. By Mr. James T. Walker, Troy, N. Y., for red Irish setters, one dog and three bitches, whelped April 10, 1884, by champion Glencho out of Claire (A. K.R. 283).

Monarch S. By Mr. J. K. Smith, Waterbury, Ct., for orange and white English setter dog, whelped Oct. 29, 1883, by champion Foreman out of Tallman's Jennie (Lathrop's Dick—Harrington's Gyp).

Foreman II. By Mr. N. Wallace, Waterbury, Ct., for blue belton English setter dog, whelped Oct. 29, 1883, by champion Foreman out of Tallman's Jennie (Lathrop's Dick—Harrington's Gyp).

Portland. By Mr. W. Bradford Smith, Orange, N. J., for liver and white ticked pointer dog, whelped Feb. 22, 1884, by Lord Sefton (Croxteth—Vinnie) out of Clio (Sensation— ——).

Laura B. By Mr. W. H. Pierce, Peekskill, N. Y., for red Irish setter bitch, whelped April 2, 1884, by champion Glencho out of Hill's Daisy (Chief—Tilley).

BRED.

☞ *See instructions at head of this column.*

Blonde II.—Prince B Mr. John Bolus's (Wooster, O.) English setter bitch Blonde II. (Britton—Blonde) to Prince B. (Pontiac II.—Buckeye Belle).

Breeze—Blue Dick. Mr. John Bolus's (Wooster, O.) imported English setter bitch Breeze (Lord Downe's Duke—Belle) to Blue Dick (Blue Dash—Jolly May).

Posy B.—Blue Dick. Mr. John Bolus's (Wooster, O.) English setter bitch Posy B. (Pontiac II.—Buckeye Belle) to Blue Dick (Blue Dash—Jolly May).

Spinaway—Maxim. Mr. J. W. Munson's (St. Louis, Mo.) imported pointer bitch Spinaway (Garnet—Keswick) to Maxim (Garnet—Jilt).

Helen—Boz. Messrs. R. & W. Rutherfurd's (New York) bull-bitch Helen to their Boz (A.K.R. 441), May 9.

Marvel—Meteor. Mr. J. W. Munson's (St. Louis, Mo.) pointer bitch Marvel (Croxteth—Trinket) to his champion Meteor.

——*—Meteor.* Mr. J. W. Harries's imported pointer bitch —— to Mr. J. W. Munson's champion Meteor.

——*—Bang.* Mr. J. H. Richards's pointer bitch —— to Mr. J. W. Munson's imported Bang (Bang—Luna).

Rita Croxteth—Meteor. Mr. George S. Tucker's (Peterborough, N. H.) pointer bitch Rita Croxteth (A.K.R. 168) to Mr. J. W. Munson's champion Meteor.

Kate—Bang. Mr. T. W. Sterling's pointer bitch Kate (Croxteth—Trinket) to Mr. J. W. Munson's imported Bang (Bang—Luna).

Dent—Meteor. Mr. J. W. Blythe's pointer bitch Dent (Faust—Lassie) to Mr. J. W. Munson's champion Meteor.

Dell—Meteor. Mr. George A. Castleman's pointer bitch Dell (Croxteth—Trinket) to Mr. J. W Munson's champion Meteor.

Winnie—Bruce. The Kilmarnock Collie Kennel's (Boston, Mass.) imported collie bitch Winnie to their Bruce (Marcus—Isle), March 25.

Pearl—Snap. Mr. E. W. Jester's (St. George's, Del.) Italian greyhound bitch Pearl (A.K.R. 758) to Snap (Rome II.—Naughty), May 20.

Ruth—Bobolink. Mr. E. W. Jester's (St. George's, Del.) English setter bitch Ruth (A.K.R. 827) to his Bobolink (A.K.R. 1167), May 23.

Leesburg—Bang. Mr. T. B. Legare's pointer bitch Leesburg to Mr. J. W. Munson's imported Bang (Bang—Luna).

Flash III.—Meteor. Mr. J. W. Munson's (St. Louis, Mo.) imported pointer bitch Flash III. (Bang—Pride) to his champion Meteor.

Vanity—Meteor. Mr. J. W. Munson's (St. Louis, Mo.) imported pointer bitch Vanity (Bang—Pride) to his champion Meteor.

Dixey—American Belton. Mr. John Bolus's (Wooster, O.) English setter bitch Dixey (Belton—Dimple) to American Belton (Belton—Blonde).

Buckeye Belle—Chip. Mr. John Bolus's (Wooster, O.) English setter bitch Buckeye Belle (Belton—Belmore) to Chip (Belton—Burlesque).

Cherry Blossom—Don. Mr. John A. Doolittle's (New Haven, Ct.) cocker spaniel bitch Cherry Blossom (A.K.R. 729) to his Don (Dart—Floss), May 25.

Flora—Black Prince. Mr. H. Reiche, Jr.'s (New York) cocker spaniel bitch Flora (Flake—Lady) to Mr. A. C. Wilmerding's Black Prince (A.K.R. 62), May 10.

Coomassie—Gladstone. Mr. L. Shuster, Jr.'s English setter bitch Coomassie (A.K.R. 949) to Mr. P. H. Bryson's Gladstone (Dan—Petrel), May 12.

Iona—Bruce. The Kilmarnock Collie Kennel's (Boston, Mass.) imported collie bitch Iona to their Bruce (Marcus—Isle), Feb. 28.

Nellie—Glencho. Mr. F. Lynch's (Newburgh, N. Y.) red Irish setter bitch Nellie to Mr. W. H. Pierce's champion Glencho, April 10.

Zelda—Glencho. Mr. Jean Grosvenor's (Boston, Mass.) red Irish setter bitch Zelda to Mr. W. H. Pierce's champion Glencho, April 17.

Mag—Glencho. Mr. Richard Bennett's (Lowell, Mass.) red Irish setter bitch Mag (Berkley—Tilley) to Mr. W. H. Pierce's champion Glencho, April 21.

Netta—Glencho. Mr. J. E. Graham's (Wilmington, Del.) red Irish setter bitch Netta (Spy—Reeta), to Mr. W. H. Pierce's champion Glencho, May 11.

Biddy—Glencho. Mr. Wm. Dunphy's (Peekskill, N. Y.) red Irish setter bitch Biddy (Elcho III.—Mag) to Mr. W. H. Pierce's champion Glencho, May 3.

Lulu II.—Glencho. Mr. J. J. Scanlan's (Fall River, Mass.) red Irish setter bitch Lulu II. (Berkley—Lulu) to Mr. W. H. Pierce's champion Glencho, May 7.

Vic—Glencho. Mr. C. H. Dayton's (Peekskill, N. Y.) red Irish setter bitch Vic (Elcho—Lady Helen) to Mr. W. H. Pierce's champion Glencho, May 5.

Nora—Glencho. Mr. A. A. Sampson's (Troy, N. Y.) red Irish setter bitch Nora (Elcho—Fire Fly) to Mr. W. H. Pierce's champion Glencho, May 11.

Lizzie—Glencho. Mr. W. H. Cox's (Newport, Ky.) red Irish setter bitch Lizzie (Rory O'More—Queen Bess) to Mr. W. H. Pierce's champion Glencho, May 17.

Fan O'Mason—Glencho. Mr. J. N. Dyckman's (Peekskill, N. Y.) red Irish setter bitch Fan O'Mason (Larry—Gussie II.) to Mr. W. H. Pierce's champion Glencho, May 19.

WHELPS.

Iona. The Kilmarnock Collie Kennel's (Boston, Mass.) imported collie bitch Iona, April 28, eight (two dogs), by their Bruce (Marcus—Isle).

Donna. Dr. C. A. Packard's (Bath, Me.) English setter bitch Donna (A.K.R. 499), May 10, seven (two dogs), by Mr. A. M. Tucker's Dash III.; one dog since dead.

Kate. Mr. T. W. Sterling's pointer bitch Kate (Croxteth—Trinket), seven, by Mr. J. W. Munson's imported Bang (Bang—Luna).

Dent. Mr. J. W. Blythe's pointer bitch Dent (Faust—Lassie), six, by Mr. J. W. Munson's champion Meteor.

Dell. Mr. Geo. A. Castleman's pointer bitch Dell (Croxteth—Trinket), nine, by Mr. J. W. Munson's champion Meteor.

SALES.

☞ *See instructions at head of this column.*

Grace. Liver and white ticked pointer bitch, whelped Feb. 22, 1880 (Don—Dot), by Mr. F. W. Chapman, Darlington, Wis., to Mr. F. H. Dwyer, New York.

Brewster. Blue belton English setter dog, whelped Dec. 24, 1883 (Blue Dick—Bramble), by Mr. John Bolus, Killbuck Kennel, Wooster, O., to Mr. A. Saybolt, Jr., same place.

Bruce. Black and white English setter dog, whelped May 15, 1883 (Blue Dick—Buckeye Belle), by Mr. John Bolus, Wooster, O., to Mr. Thos. Gregory, Provencal, La.

Ashmont Nina. Red Irish setter bitch, whelped March 17, 1884 (Nimrod, A.K.R. 631—Romaine, A.K.R. 638), by the Ashmont Kennel, Boston, Mass., to Mr. S. J. Lobdell, East Paw Paw, Ill.

Fezzan. Mastiff dog, whelped Jan. 26, 1884 (Diavolo, A.K.R. 543—Madge, A.K.R. 548), by the Ashmont Kennel, Boston, Mass., to Miss A. M. Libby, Chelsea, Mass.

Glencho—Claire whelp. Red Irish setter bitch, whelped April 10, 1884, by Mr. James T. Walker, Troy, N. Y., to Mr. John Wilson, Baltimore, Md.

Dash III.—Donna whelps. English setters, whelped Oct. 12, 1883, by Dr. C. A. Packard, Bath, Me., a white and black dog to Mr. A. M. Tucker, Charlestown, Mass.; a white and black dog to Mr. Thomas M. Steele, Dover, N. H.; a blue belton dog and a white and black bitch to Mr. J. W. Kittridge, Ayer, Mass., and a blue belton bitch to Mr. John A. Graham, Chester, S. C.

Portland. Liver and white ticked pointer dog, whelped Feb. 22, 1884 (Lord Sefton—Clio), by Mr. J. B. Brown, Montclair, N. J., to Mr. W. Bradford Smith, Orange, N. J.

Pink. Black and white English setter dog, whelped May 15, 1883 (Blue Dick—Buckeye Belle), by Mr. John Bolus, Wooster, O., to Mr. Thos. A. Addison, Chelsea, Mass.

Duke. Blue belton English setter dog, whelped Oct. 20, 1882 (Pontiac II.—Buckeye Belle), by Mr. John Bolus, Wooster, O., to Mr. D. L. Slade, Boston, Mass.

Cassandra T. White and black English setter bitch (A.K.R. 943), by Mr. L. Shuster, Jr., Philadelphia, Pa., to Mr. W. Tallman, Pawtucket, R. I.

Clarinda T. White and black English setter bitch (A.K.R. 945), by Mr. L. Shuster, Jr., Philadelphia, Pa., to Mr. W. Tallman, Pawtucket, R. I.

Pluck. Irish terrier dog (A.K.R. 197), by Mr. Lawrence Timpson, Red Hook, N. Y., to Mr. W. A. Coon, same place.

Foam—Ruby II. whelps. Chesapeake Bay dog and bitch, whelped Jan. 15, 1884, by Mr. G. G. Hammond, New London, Ct., to Mr. M. E. Sears, Lafayette, Ind.

Primer—Jersey Gyp whelp. English setter, color, age and sex not given, by Mr. W. E. Rea, Hackettstown, N. J., to Mr. Jas. Houtaling, Hurley, N. Y.

Don. Red Irish setter dog, whelped April 10, 1884 (champion Glencho—Claire, A.K.R. 283), by Mr. Jas. T. Walker, Troy, N. Y., to Mr. Waldo K. Chase, same place.

Sultana. Red Irish setter bitch, whelped April 10, 1884 (champion Glencho—Claire, A.K.R. 283), by Mr. Jas. T. Walker, Troy, N. Y., to Mr. Erastus Corning, Jr., Albany, N. Y.

PRESENTATIONS.

☞ *See instructions at head of this column.*

Foam—Ruby II. whelps. Chesapeake Bay dogs, whelped Jan. 15, 1884, by Mr. G. G. Hammond, New London, Ct., one to Mr. R. S. Floyd, San Francisco, Cal.; one to Mr. James Flood, Jr., San Francisco, Cal., and one to Lieut.-Gov. Chas. E. Laughton, Carson, Nev.

Rifle and Trap Shooting.

FIXTURES.

May 26 to 31.—First International Clay-Pigeon Tournament, at Chicago, Ill. Managers, Ligowsky Clay-Pigeon Co., P. O. Box 1292, Cincinnati, Ohio.

June 3 to 9.—Annual Tournament Louisville Sportsmen's Association, Louisville, Ky. J. O. Barbour, Secretary, 157 Third avenue, Louisville.

RANGE AND GALLERY.

PHILADELPHIA.—The Passyunk Rifle Co. and Cosmopolitan Rifle Club, two Philadelphia organizations, contested in a match at the Stockton Rifle Range, Camden, on the 21st. Conditions were, any open-sight rifle over 3 pounds pull, 200yds., off-hand. The Passyunk team shot with Remington .32, rim-fire and Union long cartridge. The other club used heavier rifles and stronger ammunition, both of various manufactures. The following is the result:

Passyunk Rifle Co.		Cosmopolitan Rifle Club.	
Capt J D Vaulet	4444545444—42	Geo W Coulston	5545425435—43
J B Hoffner	4444545454—42	W Chambers	4444444451—41

	369		342

Several of the contestants had never shot over the 200yd. range before.

NEW JERSEY.—To-morrow afternoon, May 30, there will be an opportunity at the Shooting Park, in South Orange avenue, to see a competitive trial between eight or ten of the best riflemen in the country. Such shots as Joiner and Brown, of the American team of 1883, Oehl, Will Hayes, Zettler and Dorrier, besides two or three others who are equally well known, have arranged to fire each one hundred times at the ring target, 200yds., to determine which is the best marksman. There will be no prizes, but a natural pride in his reputation will move each man to do his best work. No admission fee will be charged. The spectators will find that the new gallery will afford them a standing place where they can look down on the contest, seeing both the men and the target. The match will begin about 1 o'clock and last about three hours.

The festival of the Newark Shooting Society, on June 9, 10, 11, and 12, promises to be the biggest ever held. Prizes amounting to $2,000 are offered, and well-known shots from many Eastern cities and even from points beyond the Mississippi, will compete.

A DISPUTED TURN.—Boston, Mass., May 22, 1884.—*Editor Forest and Stream:* There is a dispute about the ruling of a certain president of a rifle club here, which you will please answer through the medium of the FOREST AND STREAM. The facts in the case are these: A silver medal is being shot for every Thursday night for six months. A re-entry is allowed, making two scores per man. The highest score of the evening wins the medal, and the winner wears the medal until the following Thursday night, when the medal is again contested for, and so continued until the six months have expired. A certain member leads off and the other shooters follow, according to the order of their names, which have been entered in a book by the secretary of the club. The president of the club calls upon the first shooter to lead again as all members have shot once around. The member objects to lead again, wishing to hang back until the last, as he expresses it, to see what is scored. The president ordered him to shoot in his turn or forfeit his re-entry fee. He was not willing to shoot in his turn, and demanded his re-entry fee back again. The president rules that he cannot have his money back, and that he must shoot when his name is called. Please give decision, and oblige—RUDOLPH SCHAEFER. [It was the duty of the marksman to shoot his score when called to the firing point. To yield to the demand of the shooter in this case would create a precedent which might bring the match to a short end-ing.—ED.]

BOSTON, May 24.—There was a large attendance of riflemen on the range at Walnut Hill to-day. The day proved a bad one for close shooting, wind blowing most of the time down the range. J. Francis, who, by the way, has another and a real name, an old member of the association, now a non-resident, was present, and as usual, was shooting with an odd firearm, a .25-caliber rifle. With this little gun he made several brilliant scores, and in the team shoot secured fourth position. The interesting event of the day was a telegraphic match between teams representing the Massachusetts Association and the Springfield Armory Club. As will be seen by the records appended, "ye men of Walnut Hill" were victorious by a score of 316 against their opponents' score of 314. The records in all the matches are appended:

THOMASTON, CONN.—The shooting tournament of the Empire Rifle Club, at the opening of their new range here on the 21st and 22d, was the biggest kind of a success. The weather was perfect, and a large delegation of visiting riflemen were present and expressed themselves as highly pleased with the range, saying that it was one of the best in location and appointments in New England. Some of the most notable shots present were G. W. Ellsworth, of the Gardner (Mass.) Club; W. Charles, of the Walnut Hill Club, Boston; G. H. Hubbard, D. E. Marsh and W. H. Beardsley, of Bridgeport, Conn.; O. B. Hull, of Collinsville, and H. Andrus, of Hartford. The conditions of the shoot were: Distance, 200yds.; off-hand; Massachusetts ring target; rifles limited to 3lbs. trigger-pull; strings of 5 shots each, possible 60, three highest to count for prize, making a possible 180; re-entries unlimited. The following are the prize-winners, the three highest tieing with a score of 170:

G. W. Ellsworth.

First score	11	12	12	12	11—58
Second score	11	10	12	11	12—56
Third score	10	12	11	11	12—56—170

Prize, $40.

W. Charles.

First score	12	10	12	11	12—57
Second score	10	12	12	12	11—57
Third score	12	10	11	11	12—56—170

Prize, $20.

O. B. Hull.

First score	11	12	12	10	12—57
Second score	12	12	9	12	12—57
Third score	12	10	11	12	11—56—170

Prize, $15.

G. H. Hubbard 168, W. H. Beardsley 163, D. E. Marsh 162, E. Nothnagle 161, H. Andrus 161, W. H. Dunbar 158, B. Higley 158, G. A. Lemmon 154, D. S. Seymour 154, J. Gregory 153, W. W. Tucker 152, B. H. Sutliff 152, D. B. Wilson 150, S. J. Lyon 149, C. F. Williams 146, G. W. Canfield 146, B. W. Pease 143, Capt. O'Brien 133, M. O'Connell 137, W. H. Tuttle 135, C. L. Alling 134, G. F. North 134, A. R. Lacy 133, P. Simmons 132, D. C. Calhoun 130, P. M. Beers 129, R. S. Goodwin 129, E. W. Bennett 125.

G. W. Ellsworth also took a special prize of $10 for the largest number of bullseyes, 102. Over $100 were given in cash prizes.—F. A. P.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE INTERNATIONAL MATCH.

[*Special to Forest and Stream.*]

CHICAGO, Ill., May 23, 9:18 A. M.

OWING to windy weather the International championship match was postponed to ten o'clock this day. In the Chicago sweepstakes, 5 single birds, 15yds rise, entrance $7, there were 56 entries. Still, Perry, Sheldon, Williams, Jenkins and Taylor divided first money. Drake and Calhoun second, Rowers, Sampson, Taber, Wilson and Kleineman third. Second sweepstakes, 74 entries, 18yds. rise, $6 each, 7 birds. J. A. Prechtel, Cleveland, won first money, scoring 7 straight birds. Perry and Mills second. Gartright and Riley third. The third sweepstake was a miss and out, $8 each, 18yds. rise, 20 entries. Gartright and Jenkins tied and divided the stake. The championship match is the exciting topic to-day. Visiting sportsmen from all sections are here in large numbers. J. E. B.

THE CHAMPIONSHIP TEAM MATCH.

1:45 P. M.—The Championship Team match began at 10 o'clock this morning. The scores so far are as follows: Blue Island Gun Club (Illinois) 22; Jacksonville (Ill.) Gun Club, 24; Chicago Gun Club, 25; Diana Gun Club (Chicago), 24; Bradford (Pa.), No. 1, 22; Bradford (Pa.), No. 2, 29. Eight other teams are to follow. Best individual score of ten straight was made by C. H. McKenett of Bradford, Pa.

WALNUT HILL, May 24.—Some days since I mailed you a card giving dates on which occur the regular shoots of the Massachusetts Rifle Association, which you kindly published, thus making known to the lovers of the rifle and shotgun in other sections of the country who may have occasion to visit this vicinity, and possibly may be pleased to spend a few hours at Walnut Hill, the days they can do so with the certainty of witnessing a shoot, and should they so desire enjoy the privilege of participating in the same. Our range, and matches generally, are open to all, and we are pleased to have all who enjoy the sports we indulge in come and participate.

Wednesday last was shotgun day at the range, and the day and occasion proved most enjoyable, as a more perfect day is rarely had for out-door sports. Inclosed I hand you report of the day's doings:

First event, 5 clay-birds, 12 entries—Francis first, Tobin second, Evans third, Snow and Newton divided fourth.

Second event, 5 glass balls, 9 entries—DeRochmont and Hart divided first, Tobin second, Francis third.

Third event, 5 clay-birds, 12 entries—Stanton and Francis divided first, Evans and DeRochmont divided second, Nichols third, Tobin fourth.

Fourth event, 3 pair clay-birds 12 entries—Hart first, Evans and Snow divided second, Stanton third, Nichols fourth.

Fifth event, 5 clay-birds, 18 entries—DeRochmont and Stanton divided first, Evans and Francis divided second, Thompson, Eddy and Cutting divided third, Papanti and Souther divided fourth.

Sixth event, 5 glass balls, 12 entries—Francis and Tobin divided first, DeRochmont and Evans divided second, Newton and Shattuck divided third, Short fourth.

Seventh event, 3 pair clay-birds, 13 entries—DeRochmont, Evans and

Stanton divided first, Snow and Short divided second, Eddy third, Souther and Tobin divided fourth.

Eighth event, 5 clay-birds, 22 entries—Shattuck first, Evans and Gore divided second, Francis third, Nichols fourth.

Ninth event, 5 glass balls, 9 entries—Evans and Decker divided first, Nichols second, Francis third.

Tenth event, 5 glass balls, 13 entries—Francis and Snow divided first, Evans and Warner divided second, Decker and Nichols divided third, Crosby fourth.

Eleventh event, 5 clay birds, straightaway, 19 entries—Francis and Evans divided first, Hart and Tobin divided second, Crosby third, Cutting and Warren divided fourth.

Twelfth event, 5 glass balls, 10 entries—Decker first, Tobin and Evans divided second, Newton third, Warren and Short divided fourth.

Thirteenth event, 3 pair clay birds, 16 entries—Decker and Francis divided first, Stanton second, Hart third, DeRochmont fourth.

Fourteenth event, 7 clay birds, 20 entries—Evans and Stanton divided first, DeRochmont, Thompson and Parker divided second, Souther third, Warren and Cutting divided fourth.

Fifteenth event, 5 glass balls, 13 entries—Crosby and Francis divided first, Tobin, Newton and DeRochmont divided second, McCoy and Eddy divided third, Warren fourth.

Sixteenth event, 3 pairs clay birds, 9 entries—Decker and Francis divided first, Nichols and Gore divided second, Snow third.

Seventeenth event, 5 glass balls, 10 entries—Francis and McCoy divided first, Nichols and Eddy divided second, Decker third, Warren fourth.

Eighteenth event, 5 clay birds, 21yds. rise, use of both barrels, 20 entries—DeRochmont, Marston and Francis divided first, Stanton and Gore divided second, Nichols and Crosby divided third, Short fourth.

NIAGARA.—The fifth of the monthly shoots for the medal which is to decide the championship of Niagara county, took place on Saturday last, on the old shooting grounds between Niagara Falls and Suspension Bridge. The following is the score:

E M Moody	1101111111111011111111111—23
E H Smith	1111111101011111111111011—22

Van Staden, 23yds	1111110—6	Stillwell, 23yds	0001111—4
Layton, 21yds	1111110—6	W Harned, 23yds	0111110—5

WILL NOT BREAK WITH ONE SHOT.—Poughkeepsie, May 2.—*Editor Forest and Stream:* Some time ago I noticed an advertisement in FOREST AND STREAM of the Target Ball & Pigeon Co. of Stockport, N. Y., saying that their target balls were far superior to glass balls, were no injury to the finest lawns, and were sure to break if struck by a single pellet of No. 8 shot, and much more to the same effect. We tried the balls several times, and it was very seldom that a ball would break if struck by no more than one or two No. 8 shot. In fact we were constantly picking up balls with one, two or three holes in them. We hung one up on a stick at 40yds. and shot at it, and it took three charges to break it, each time putting one shot through. We repeated this several times and found that it was almost impossible to break these balls with one pellet. A good composition ball would be a great thing, as almost all farmers and owners have objections to broken glass on their land.—A. C. G. [The remedy is to load or hold the gun better. The only ball that will suit everybody will be one that can stand all kinds of rough handling, but will break automatically when a gun is pointed at it.]

WELLINGTON, Mass., May 24.—The summer heat to-day tended to augment the number of shooters at the grounds of the Malden Club at Wellington, and a goodly array of events were participated in, as follows:

Gold Badge Contest.

Field	1011011111111101101—16
Buffum	1011111101111111000—15
Saunders	1110111001011111111—15
Hopkins	1111011111111100000—14
Brown	0111010111101011011—14
Nichols	1100101110011111111—14
Scott	1101111110010110101—14
Sanborn	1111001011010110101—13
Adams	0110110101011111000—12

Winners—First badge, Field; second, Saunders; third, Scott.

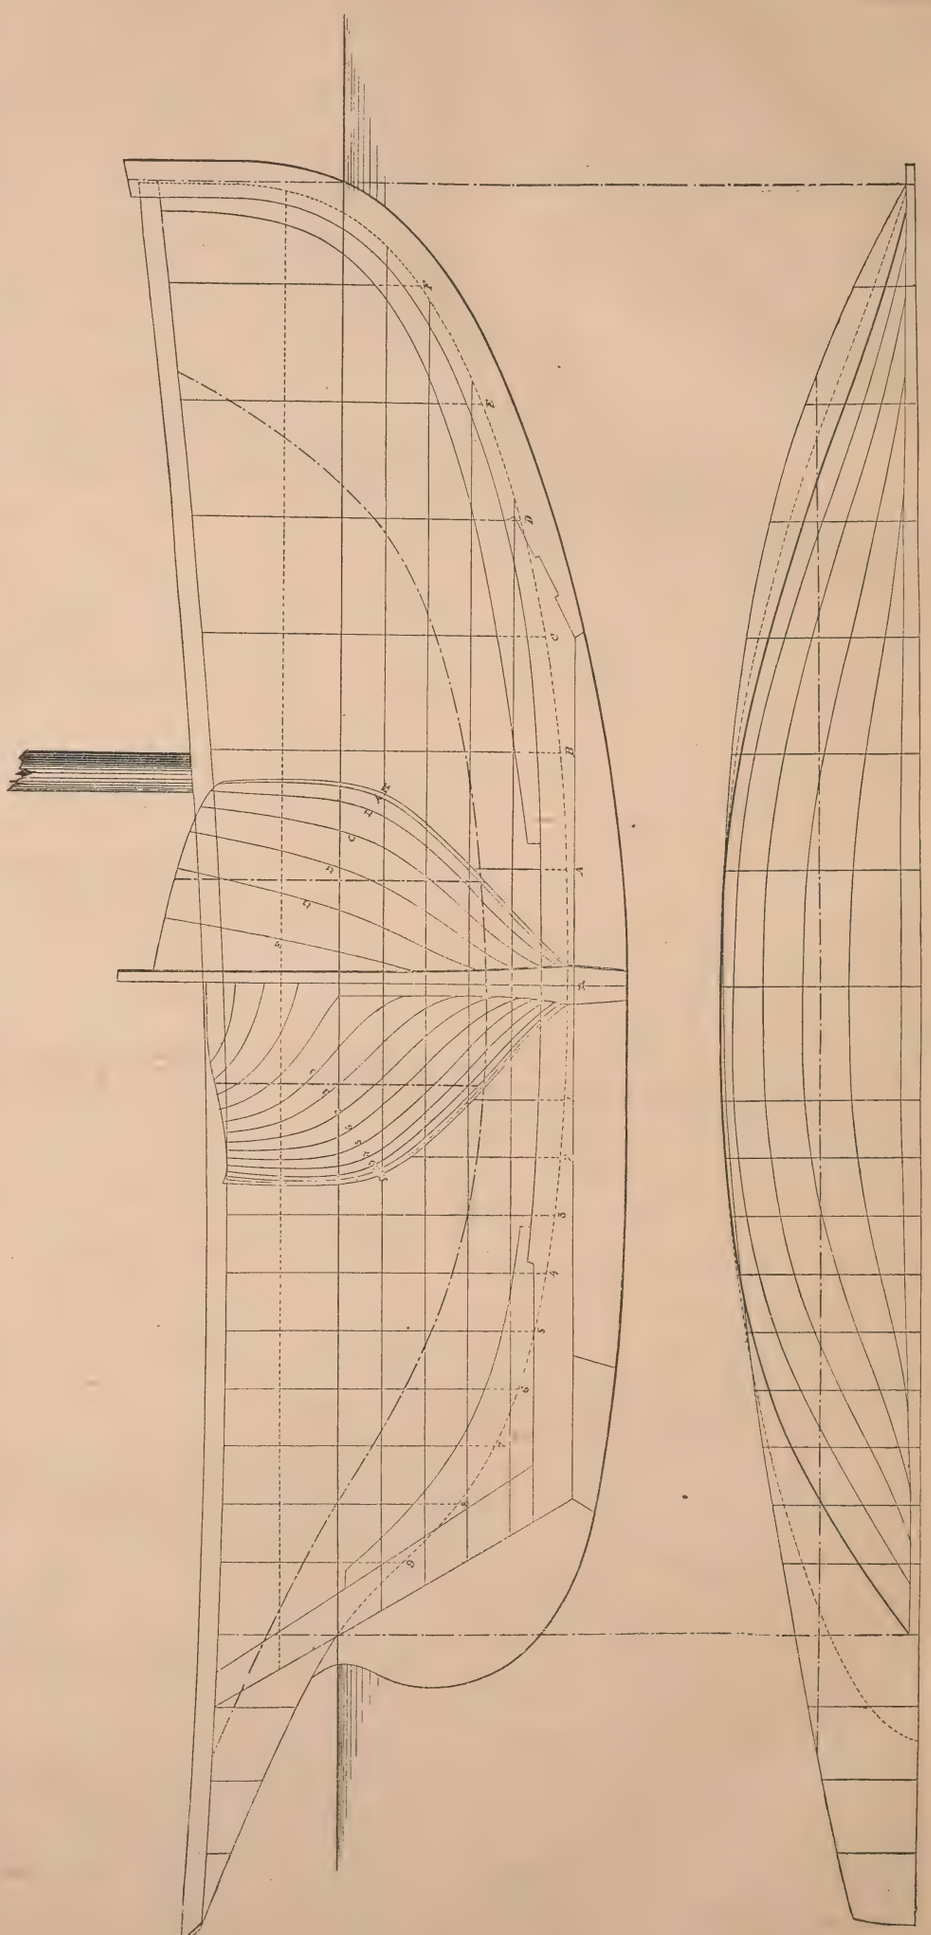
SYRACUSE, May 25.—A large crowd assembled at Lake Side Park, Friday, May 23, to see the clay-pigeon match between Geo. C. Luther, of this city, and John E. Graham, of Canastota, N. Y.; 100 clay-pigeons each, 18yds. rise, trap set in 4th notch, use of one barrel:

Luther—1111111101111111111111111111111111111111011111111111111111101 1111111111111111111011111111111011111—95.

Graham—1101111111010101011100111111101110111111111001111111111101 1111110111001111111111111101111111111—84.—I. I. C.

BELLEVILLE, Ont., May 21.—The first contest for the possession of the champion badge of the Sportsman's Club, which is to be won three times before it becomes the property of any one, took place to-day on the rifle ranges. Six competitors came to the front, and when the contest opened a number of spectators were present. The conditions were: Card trap rotating, 18yds., 15 glass balls each. While the score was being recorded it was plain to be seen that the contest for the trophy lay between Prof. Bell, his son R. S. Bell and John N. Pringle. Mr. R. S. Bell, first vice-president of the club, led the score and captured the prize. Prof. Bell, for a gentleman of his years (78) did remarkably well. Appended is the score of the leaders:

R S Bell	1101111111101011—12
Prof Bell	0110101111111011—11
J N Pringle	0111111111100000—10



Messrs. S. R. Balkwell, W. Mills and C. Wallace followed in the order named. The second competition will take place on Friday, June 13.

Yachting.

FIXTURES.

Secretaries of yacht clubs will please send early notice of proposed matches and meetings.

May 30.—Knickerbocker Y. C., Spring Matches.

July 30.—Quincy Y. C., Third Match.

THE MERLIN.

OF the many new boats of the cutter type now building in New York and the East, none is better worthy of notice than the cruiser now building in South Brooklyn from the designs of an amateur, who has devoted some study to this class of boat.

The main objects of her designer were safety and accommodation, speed being but of secondary importance; but we shall be disappointed if she does not make almost as good a showing in the latter respect as in the former two. The boat has the wave form throughout, the calculations being based on the theories of Mr. Colin Archer. The radius of the construction circle (1ft. 6in.) was so selected, however, as to make the center of gravity of the curve of areas nearly coincident with the centers of buoyancy, etc.

The frame is of white oak, keel sided and moulded 8in., stem and stern sided 4in, frames all of steamed oak, 2½×3 at heels, tapering to 2×1½ at heads, and spaced 12in center to center. The bilge clamps and wales are of yellow pine, the plank 1in. thick, of white cedar, and the ceiling of white pine. The planksheer is of white oak bent on cold, and the deck of narrow white pine, laid with the side line. The fastenings are all of copper, riveted over burrs.

On deck forward is a hatch opening into the forecastle, over the cabin is a companion and skylight in one, and aft a cockpit 5ft. long. Immediately under the cockpit is a drawer for ice, below which is a water tank in the run. On descending the companion ladder there is a closet to starboard, just aft of which, and partly below the cockpit, is a sail locker; while on the port side there is an extra berth running back beside the cockpit. A narrow door at the head of this berth, in connection with the similar door of the closet opposite, serves to shut off this portion of the boat from the main cabin.

The cabin proper has two lockers, the seats of which are arranged to fold out, making large berths for sleeping. On the starboard side forward is a washstand and mirror, the former provided with a hinged top, making a small table of it if required, and opposite, on the port side, is a space bulkheaded off for a w. c.

A door abreast the mast gives access to the forecastle, where a place is provided for a stove and a berth for one man. The chain locker is just forward of the mast, thus lessening the weight in the bows.

The workmanship throughout is of the first class, and in every way she is a credit to her builder, Mr. Daniel C. Bernard, who may well be proud of her. Her sails, the drawings of which we will publish next week, are being made by Wilson & Griffin, of South street, and in quality will be in no way inferior to the rest of the work.

The following are here principal dimensions:

Length on L.W.L.	35ft.
Length over all	30ft. 4in.
Beam extreme	7ft.
Draft of water	5ft.
Height of freeboard	1ft. 11in.
Midship section aft center of length L.W.L.	1ft. 9in.
Area load water plane	59.79 sq. ft.
Center of gravity ditto forward section	.133ft.
Area midship section	17.47 sq. ft.
Center of buoyancy forward section	.144ft.
Center of buoyancy below L.W.L.	1.468ft.
Center lateral resistance aft center of length L.W.L.	2ft.
Center effort of lower sails aft center of length L.W.L.	1ft. 6in.
Displacement in long tons	7.14
Ballast inside	2½ tons.
Ballast outside	2 tons.
Mast, from foreside stem	10ft.
Mast, deck to hounds	23ft.
Topmast, fid to sheave	19ft. 6in.
Boom	26ft.
Gaff	17ft.
Bowsprit, outboard	13ft.
Area lower sail	730 sq. ft.
Masthead	5ft.
Angle of gaff with horizontal	51 deg.

FOOD AT SEA—CHEESE VS. SALT JUNK.

ANY one who is able to find a substitute for salt junk is a benefactor to our seamen, and it would appear that such a benefactor has arisen in the person of Mr. W. Mattieu Williams, F.C.S., who has lately been delivering the "Cantor" lectures for the year at the Society of Arts to crowded audiences. The substitute is cheese. Not cheese eaten as it is purchased, but cheese to which has been restored the proper amount of the salts of potass necessary to convert it into nutritious and digestible food. It is well known that the chief reason why salt meat is unwholesome and not nutritious is that the salts of potass have been driven out of it in the pickling. It is now known that one reason why cheese is indigestible is because the salts of potass originally in milk are absent from cheese.

As regards the relative nutriment in meat and cheese the Professor tells us that—

"Taking the composition of a whole skinned and prepared sheep or ox as it hangs in a butcher's shop, the amount of nutriment in it is about equal to one-third of its weight of cheese. The fat is about the same in both, but the difference is due to the bones and excess of water. Thus twenty pounds of cheese contain as much nutritious material as a sheep of sixty pounds weight and would have the same value as practical nutriment of it could be as easily digested. "Cheese is the most portable of all food, even more so than wheat, on account of the greater value in a given bulk."

Mr. Williams goes on to tell us that the common English or American cheese is the best for the purposes of food. Here, then, we have in our midst the most valuable food to be obtained, and it is not used simply for the reason that owing to absence of salts of potass it is indigestible. Make it digestible by restoring the potass, and we have food for our toiling millions on shore, and for those at sea a food which will go far to not only nourish the consumer, but to make him proof against scurvy as well.

Here is the recipe, and we would advise our readers who are master mariners to copy it into their private logs, and those who are landsmen to have a copy made for use in the kitchen. Cheese prepared as below is not only good and sufficient of itself for a meal with potatoes, rice, etc., but forms a most useful, digestible, and appetizing adjunct to the *menu* of even a "swell" dinner.

1. Cut the cheese into shreds, or grate it, or chop it up fine, like suet.

2. To every pound of cheese thus treated add quarter of an ounce of bi-carbonate of potass. [This as nearly as possible puts back into the cheese the amount of potass that was taken out of it in separating (by rennet) the curds in the original milk.]

3. Put the mixture of cheese and bi-carbonate of potass into a saucepan with either three times its bulk of cold water or four times its bulk of cold milk and mix well.

4. Put the saucepan on the fire and bring the mixture slowly to the boiling point, taking care to stir it all the time.

5. Having got it to boil, keep it hot until the cheese is melted which does not take long.

6. Turn it out into a dish, and the result gives a beautiful nutritious mixture which thickens like a custard in cooling. This custard may be eaten with impunity even by those persons who would be ill after eating a piece of cheese the size of a nut, and is peculiarly adapted as food for all persons who work hard with either brain or muscle.

Fancy dishes may be made by the ship's cook in the following manner for the captain's and passengers' tables, *e. g.*, take the mixture of cheese and bi-carbonate and water (or milk) given above, and add to it two eggs, white and yolk beaten up together, for every quarter of a pound of cheese in the mixture. Put into a dish or a series of disnes (previously buttered) and bake till brown. This must be eaten with bread or biscuit. Another way is to make the mixture a little thinner by adding a little more milk or water, and to put it in a pie dish with slices of bread laid one over the other. The custard should be poured in cold and left for an hour to soak before it is baked. This dish is a great improvement on the ordinary bread and butter pudding.—"*Sea Cook*" *in Nautical Magazine.*

A "PLANK ON EDGE."—The term "plank on edge," first applied derisively to anything whose moderate beam did not entitle her to the designation of "flatiron," seems likely to become almost literally true, if we may judge from the drawing of the new three-tonner Ne Plus Ultra, described by Mr. Dixon Kemp in a late number of the London *Field*. The principal dimensions of this remarkable craft are as follows: Length over all, 60ft.; length on L.W.L, 38.5ft.; beam extreme, 3ft.; draft of water, 11ft.; ballast on keel, 15 tons; displacement, 19.8 tons; center of buoyancy below W.L., 2.9ft.; ratio of sail area to wetted surface, 2.43; area of lower sail 1,500 sq. ft.; mast, deck to hounds, 26ft.; tonnage, Y. R. A. rule, 3 tons; tonnage, sail area rule, 12 tons. Of course the advantages such a boat enjoys are only possible under the arbitrary rule at present in vogue in England, and they would at once disappear under any rule that gauges even approximately the size of a boat; but it is to be hoped that the mechanical difficulties attendant on such an extreme form may be successfully overcome, and also that a crew long and lean enough to live aboard and work her may be found, as her success will hasten the abandonment of the present rule of measurement.

GREENWICH, CONN.—Indian Harbor will be lighted and buoyed from June 15 to Sept. 15 for the benefit of yachts entering there. Yachtsmen desiring to enter can obtain sailing directions by addressing H. F. Winslow, Indian Harbor Hotel, Greenwich, Conn.

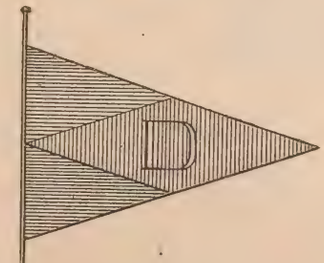
SAN FRANCISCO Y. C.—While the Nellie was out on the ways she had iron keels put on alongside the wooden ones between the fore and main chains on both sides. Some new planks were also put on. Some inside ballast was removed and a little more lead added to the keel. The plans and a model of the yacht to be built for James V. Coleman have been received. The model shows a hull of graceful lines, predominantly suggesting speed. The yacht will have some novel features, such as an unusual "drag" aft, or greater draft abaft midships; a considerably raking stern post and largely overhanging stern. The deck will present the appearance of being flush, the small house only extending over the after staterooms, and rising no higher than the skylights over the saloon and gangway from the saloon forward. A sectional view shows that there will be a stateroom on either side of the companionway and two on either side of the gangway between the saloon and galley, making six in all. The saloon will be 15ft., measuring fore and aft by the full beam of the yacht. The pantry and galley will be forward of the gangway and will be arranged with an eye to more cruising than the bay affords. The dimensions of the yacht will be 79ft. 10½in., length of deck 65ft. on water-line, 16ft. 5in. beam, 10ft. draft, and least freeboard 3ft. Her timbers will be all natural crooks of white oak, and her floor timbers rights and lefts. There will be 11 tons of lead on the keel, and a total ballast of 35 tons, all of lead. The furnishing has not been all decided upon, nor the interior decorations, but both will be elegant and luxurious, while preserving the strength and substantial qualities demanded in all the appointments of a sailing craft intended for use more than show. Mr. Coleman says he has about decided to have his craft built in the East, as all the details of the plans were made with reference to the building materials in use there, and under such circumstances yachtsmen consider it inadvisable to proceed with construction with materials not considered in the plans.

THE LAST OF A FEDERAL CRUISER.—A recent London dispatch announced the abandonment at sea of the bark Elliot Ritchie, Capt. Perkins, from Brunswick, Ga., to Buenos Ayres. The crew were landed at Fernambuco. This vessel was the last of a once celebrated Federal cruiser—the Harriet Lane. She was named after President Buchanan's niece, that estimable and popular lady who did the honors of the White House so gracefully during Mr. Buchanan's term of office. During the war the Harriet Lane made things lively for blockade runners along the Atlantic and Gulf coasts. She was a very fast vessel under steam or sail. She was once captured off Galveston, Tex., over which there was great rejoicing among the rebels, and was carried to Havana as a prize vessel by Admiral Semmes. Her engines were taken out and she was converted into a sailing vessel, bark-rigged, and was one of the fastest sailing vessels afloat. She was an old trader along the coast, latterly belonging to Savannah, and was loaded with lumber for Buenos Ayres when she was abandoned at sea.—*N. Y. Herald.*

SEAWANHAKA CORINTHIAN Y. C.—The fleet will rendezvous off the club house, Edgewater, Staten Island, on Friday morning, May 30, upon the arrival of the 10 o'clock boat from New York, for the annual Decoration Day practice sail. On signal, yachts will pass in review between the flagship and the club house, saluting the commodore's flag by dipping colors. Signals will be as follows: Preparatory signal, gun and V of code; starting signal, ten minutes later, for yachts to cross the line as above, gun and M of code. The fleet will then proceed upon one of the following courses, to be announced from the flagship before the starting signal is made: To and around Buoy 8½ on the Southwest Spit, thence to and around the Gedney Channel Whistling Buoy, thence home; or, to and around Buoy 8½ on the Southwest Spit, thence to and around the Scotland Lightship, thence home, leaving Buoy 8½ on the starboard hand.

NEW LIGHTHOUSE IN THE HUDSON RIVER.—Notice is given by the Lighthouse Board that on and after May 24, 1884, a fixed white light will be exhibited from the structure recently erected at Lampneres Dock (Narrow Channel), Hudson River, New York. The light should be seen in clear weather from the deck of a vessel twelve feet above the water ten nautical miles. The structure is a hexagonal frame portable beacon eleven feet high, on a brick foundation, one foot above the ground.

LENGTH AND SAIL AREA RULE ABROAD.—The Royal Alfred Y. C. will sail their six Channel and Corinthian matches this year under the "Length and Sail Area Rule," the six Champion Cup matches being sailed under present Y. R. A. rule; a practical test of the new rule that, it is to be hoped, will lead to its permanent adoption. The Royal London Y. C. will also sail some of their races under it.



Canoeing.

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

May 30.—Pittsburgh C. C., First Annual Regatta.
May 30 to 31.—Hudson River Meet, Newburgh.
May 30 to 31.—Connecticut River Meet.
June 14 to 16.—Merrimack River Meet.
June 19.—Rochester C. C., Summer Regatta, Irondequoit Bay.
July 9 to 15.—Chicago C. C., Annual Cruise.
July 14.—Allegheny C. C., Cruise at Conneaut Lake.
July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 12.—A. C. A. Meet, Grindstone Island.

DESERONTO C. C.

DESERONTO C. C., Deseronto, Canada. Captain, F. S. Rathbun: Mate, Geo. Clinton, M.D.; Purser, E. C. French. Organized March 17, 1884. Thirteen members. Burgee, red diamond, two blue triangles, letter D in white.

CANOEING IN THE EASTERN STATES.

FOR some unknown reason canoeing has been of much slower growth in the Eastern States than in the Middle States and Canada, there having been, previous to 1884, but few clubs in Massachusetts and Connecticut, though the number of individual canoeists has increased steadily. Of late, however, a number of new clubs have formed, and the coming meet on the Merrimack River will doubtless add largely to the ranks of canoeists. The following from the Lowell *Courier* shows the growing popularity of the sport:

"Rowing is at a low ebb in the Vesper club, although the plan of holding the annual regatta so early in the season may tend to awaken a new interest. Thus far only two or three members are known to be taking regular practice, but several others are out occasionally, and the number will increase as the weather grows warmer. The new Lowell Rowing Association seems to be having up hill work, and the new boat house is still a thing of the future. There is some difficulty about getting a suitable lot of land, and the recent benefit ball netted but a comparatively small amount, though it is hoped to swell this by a picnic later on.

"By far the most active local interest now centers in canoeing and in this popular sport the Vespers have taken the lead. Prominent oarsmen of former years are now enthusiastic canoeists and have exchanged the toil of rowing, with the strict training necessary to its satisfactory accomplishments, for the more easy, graceful and quite as healthy exercise of paddling. Single and double blades are seen glistening in the sun of a pleasant afternoon, while by sails flit about on the river and add to the witchery of the sport. From the very first the canoe interest has steadily grown, while the fleet of canoes has at the same time increased proportionately in numbers. Indian birches, which are perhaps more romantic though not so dry or comfortable as modern canoes, were first introduced and the Vesper house now contains nine of this class, largely imported from New Brunswick at comparatively small cost. Next came the light open lapstreaks which have proved quite popular, owing to ease of making a portage with them.

"In addition to the Vesper fleet there are numerous canoes housed elsewhere. Corbett's house contains two small ones used by boys. At McFarlin's are four canvas canoes, three of which are decked and used with double paddles. There is also one open lapstreak. Two finely finished home-made paper boats of fine model and good sailing capacity are housed by Williams, while a Racine St. Paul with several lapstreaks and canvas canoes are kept by individuals in various parts of the city. Altogether the number of canoes owned and used in Lowell will not fall short of forty, and probably runs higher, so it will be seen that the sport, which is yet comparatively in its infancy, has already reached extensive proportions and is still growing.

"Boating men in other cities along the Merrimack are also taking up the sport, and there are a number of active canoeists in Manchester, Nashua and Lawrence. Among the canoes in the latter city are several built of canvas and modeled exactly like a birch. They were designed by Mr. J. H. Treat, a veteran woodsman, who has used them not only on our own river but often in the wilds of Maine. Going on down the river we find canoeists in Haverhill and Newburyport, with still more in Salem. Cambridge has a club and Boston two, both of which were recently organized and one confined to birches while the other embraces legitimate cruisers. Leading cities throughout the country all boast their canoe clubs nowadays, and as showing how they do things in the West it may be stated that the Chicago club, organized Jan. 11, already has over forty members, nearly all of whom own canoes, and has arranged not only a regatta but a whole week's cruise to come off in July. Over all stands the American Canoe Association, with its 600 members, many of whom will meet, camp and race at the Thousand Islands in August.

"Canoeing properly embraces camping in connection with cruising, and it is to be regretted that so few local members of the fraternity indulge in this branch of the sport. A complete cruising canoe affords facilities not only for paddling and sailing but for sleeping as well, and when this craft takes the place of the other variety now so common, as it properly should and eventually must, there will be a more true appreciation of the field of canoeing. And it is not the racer who paddles to score as many miles as possible, but the 'dawdler' who drifts leisurely along some picturesque stream or threads his way among the islands of a beautiful lake, that fully enjoys himself and his canoe. At frequent intervals he stops to lunch, to bathe, to sleep. He is constantly in the open air and in close communion with nature. He it is who catches the spirit of canoeing, a manly pastime free from the taint of professionalism. He it is who reaches the acme of the outer's happiness, the maximum of health and pleasure at the minimum of expense."

THE ASSOCIATION BOOK.

THE third annual report of the American Canoe Association has just been completed and sent out by Secretary Neidé in the form of a neat little book from the press of the Forest and Stream Publishing Company. The officers of the Association are: Commodore, F. A. Nickerson, Springfield, Mass.; Vice-Commodore, C. K. Munroe, New York City; Rear-Commodore, Col. H. C. Rogers, Peterboro., Ont., Canada; Secretary and Treasurer, Dr. Chas. A. Neidé, Schuylerville, N. Y.

The Executive Committee is composed of the officers, with Messrs. Robert J. Wilkin, of New York, W. B. Wackerhagen, Albany, and Hugh Neilson, Toronto, Canada; the offices being so distributed, geographically, as to represent all localities in turn.

The Regatta Committee for 1884 is as follows: William Whitlock, New York C. C., New York city; E. B. Edwards, Peterboro C. C., Peterboro, Ont., Canada; L. Q. Jones, Hartford C. C., Hartford, Conn.

The list of members shows four honorary, twelve lady members and 524 active, compared with 215 active last year, a gain of 309 members. An inspection of the list shows that a large majority of the members are from the Middle and Eastern States, and Canada, the Association thus far having made but little progress in the West, although there are a large number of active canoeists west of Pittsburgh, whose interests are identical with those of Eastern canoeists, and whose names should be found in the book. The list of canoes includes 257 names.

ANNUAL MEETING, 1883.

The third annual meeting of the American Canoe Association was held in the Headquarters Marquee on Juniper Island, Stony Lake, Canada, on August 23, 1883. Officers present: E. B. Edwards, Commodore, and Dr. Chas. A. Neidé, Secretary and Treasurer.

The meeting was called to order by the Commodore. The Treasurer read his report for the year ending August 3, 1883, showing his expenditures to be two hundred and seven dollars and twenty-seven cents ($207.27), and a balance on hand of three hundred and sixty-six dollars ($366)

The Secretary's report showed a membership of four hundred and fifty (450).

The report of the Committee on "Fouls" was then read and accepted. On motion of Mr. R. J. Wilkin, an appropriation of one hundred and fifty dollars ($150) was voted for the Secretary's use for clerical hire.

The Nominating Committee then made their report, and the Secretary was directed to cast one ballot for each nominee, which resulted in the unanimous election of Messrs. Fred A. Nickerson for Commodore; C. K. Munroe, Vice-Commodore; Col. H. C. Rogers, Rear-Commodore; Dr. Chas. A. Neidé, Secretary and Treasurer. R. J. Wilkin, Hugh Neilson, W. B. Wackerhagen, three Members-at-Large.

On motion of Gen. Robt. Shaw Oliver, a vote of thanks with cheers was given Rev. Geo. L. Neidé for his services as Assistant Secretary-Treasurer during the past year, and the request that he act in the same capacity in the absence of the Secretary during the coming year. A vote of thanks, backed with cheers, was given Commodore Edwards.

On motion of Gen. Oliver, the Executive Committee was requested to look over the amended Sailing Rules and reject what they considered unnecessary.

Mr. R. J. Wilkin moved, as instruction to the Executive Committee, that the terms Junior and Senior be abolished.

The newly elected officers and Messrs. Toker and Wood then made short addresses, following which the meeting adjourned.

MEETING OF THE EXECUTIVE COMMITTEE, OCT. 13, 1883.

At the call of the Commodore, the Executive Committee of the American Canoe Association met at the Delavan House, in the city of Albany, N. Y., on the afternoon of Oct. 13, 1883. There were present: F. A. Nickerson, Commodore; C. K. Munroe, Vice-Commodore; Col. H. C. Rogers, Rear-Commodore; Dr. Charles A. Neidé, Secretary-Treasurer; Mr. R. J. Wilkin and Mr. W. B. Wackerhagen, Members-at-Large; Mr. William Whitlock and Mr. R. E. Wood (the latter representing Mr. E. B. Edwards, who was unavoidably absent), of the Regatta Committee for 1884.

The meeting was called to order by the Commodore, in the chair. Vice-Commodore Munroe presented a motion that the present officers' flags be changed to a flag 12x18 inches, on which shall be displayed a pair of crossed paddles, with the letters A. C. A. in the three upper corners and a star in the lower one. That of the Commodore to be of blue with device in white, that of the Vice-Commodore to be of red with device in white, and that of the Rear-Commodore to be of white with device in red. Unanimously carried.

The motion of Mr. W. B. Wackerhagen, seconded by Vice-Commodore Munroe, that a committee of three be appointed by the Chair to design an appropriate membership badge, was unanimously carried.

The committee then elected the following named applicants to membership in the Association, viz.: William A. Rogers, New York city; Edwin M. Gilmore, Rochester, N. Y.; H. M. Stewart, Rochester, N. Y.; G. C. Edwards, Ottawa, Canada; Chas. V. A. Decker, Rondout, N. Y.; Williams Lansing, Buffalo, N. Y.; Livingston Crosby, New York city; F. W. Battershall, Albany, N. Y.; James K. Hand, Sing Sing, N. Y., and F. J. Kirkpatrick, Springfield, Ohio. Mrs. C. K. Munroe was elected a lady honorary member. Vice-Com. Munroe then made an address on the advisability of a permanent home for the A. C. A., and made a motion, seconded by Mr. R. J. Wilkin, "that this body recommend to the Association at its next annual meeting, that the American Canoe Association have a permanent home." The motion was unanimously carried.

The members present then expressed their views as to the location of the 1884 Camp; and Rear-Com. Rogers reported that the Canadian local committee would have about one hundred and forty dollars to hand over to the Treasurer of the A. C. A. The thanks of the Committee then, on motion of Mr. Wilkins, were voted to Messrs. Edward Wood, Toker and White, for their curtesies during the Stony Lake meet. Mr. Whitlock, of the Regatta Committee, presented a motion "that the present rule of the Association, which defines that a boat shall be measured between perpendiculars, be changed to read 'A boat's sailing length be defined to be her water line length; total overhang allowed, to be defined to be not more than six inches."

The recommendations of the Regatta Committee for 1884 were then presented and accepted.

On motion of Commodore Munroe, the terms Senior and Junior were abolished, and the term *Novice* adopted, the latter to mean "one who has never sailed a race prior to January of the current year."

Applications to offer special prizes to A. C. A. races were acted on

and lost. The action of the Committee on the location of the Camp for 1884 resulted in the appointment of a committee of two, whose duty it should be to visit the various sites offered, and report. The meeting then adjoined subject to the call of the Commodore.

REPORT OF COMMITTEE ON 1884 CAMP SITE.

The Committee, appointed by Commodore Nickerson, at the meeting of the Executive Committee, Oct. 13, for the purpose of locating a site for the 1884 Camp of the American Canoe Association, visited the Thousand Island region, and inspected two sites offered, and recommended that the next A. C. A. Camp be held on the northeast end of Grindstone Island. A copy of the Committee's report was sent to each member of the Executive Board, with a request that he send in to the Commodore his vote on the same, which resulted in the unanimous adoption of the suggestion.

The regatta of 1883 included 7 paddling races, 11 sailing races, 1 sailing and paddling race, 1 double paddling races, 3 upset and 1 portage race, for which 38 prizes were given.

THE 1884 CAMP.

The fourth annual meeting and camp of the American Canoe Association will be held on Delaney's Point, at the northeast end of Grindstone Island, in the Thousand Islands region of the St. Lawrence River, commencing on Friday Aug. 1, and continuing until Friday, Aug. 15. The camp site is about four miles distant from Clayton, N. Y., and five miles from Gananoque, Canada. The steamer Puritan will make regular trips between Clayton and Gananoque, stopping at the camp on both trips when passengers are to be landed or taken on board. At Clayton, she connects with the Utica and Black River Railway, and at Gananoque with trains on the Grand Trunk Railway of Canada. The fare on this steamer will be twenty-five cents each way, with canoes and kits free. Other transportation arrangements will be made prior to the date of meeting, of which due notice will be given through FOREST AND STREAM.

The book also contains the Constitution and By-laws of the Association, with the sailing rules. It is very neatly gotton up, of a convenient size for the pocket, and altogether reflects great credit on the gentleman who has filled so well the position of secretary for the past two years.

ORGANIZATION OF CANOE CLUBS.

IN ANSWER to several inquiries from newly formed canoe clubs, we give below a constitution and by-laws that have been found to work well in practice. Article VIII. has been amended so that the election is now by postal card, the name of each new candidate being sent to the members by the secretary. If no negative replies are received, the candidate is considered elected. If a candidate is rejected, he can appeal to a ballot at a meeting of the club. This plan has been found necessary where the members live at a distance and meet but seldom.

CONSTITUTION.

Article I.—Officers.—The officers of this Club shall consist of a Commodore, Vice-Commodore, and Secretary.

Article II.—Election of Officers.—The annual election of officers shall take place at the last general meeting in each year, and said election shall be by ballot only. Each officer shall hold office until the adjournment of the last general meeting of the following year. Vacancies may be filled at any general or special meeting.

Article III.—Quorum.—Five active members to constitute a quorum.

Article IV.—Duties of Commodore.—It shall be the duty of the Commodore to take command of the squadron, to preside at all meetings, and to enforce the rules and regulations. He may call a special meeting of the Club at his pleasure, and he shall do so at the written request of two active members of the Club.

Article V.—Duties of Vice-Commodore.—It shall be the duty of the Vice-Commodore to assist the Commodore in the discharge of his duties, and in his absence to officiate in his stead.

Article VI.—Duties of Secretary.—It shall be the duty of the Secretary to keep a record of all the proceedings of the Club; to receive all moneys due the Club, and pay all bills duly contracted by it, keeping a correct account of same; and to make a report at the last general meeting in each year.

Article VII.—Voting.—All voting to be by active members of the Club; each member to be entitled to one vote.

Article VIII.—Election of Members.—Any person shall be eligible to membership. Each candidate for admission must be approved by the Executive Committee, and elected at a meeting of the Club; two negatives shall defeat an election.

Article IX.—Dues.—Each member, on his election, shall pay an initiation fee of * * dollars. If said sum is not paid within thirty days from the time of his election, such election to be null and void. The yearly dues shall be * * dollars, and shall be payable in advance.

Members who are absent from the United States for a whole year shall be exempt from their dues for such year, provided they give notice of their absence to the Secretary. On the first day in November of each year all members whose dues for the year remain unpaid shall at once be notified of the same by the Secretary; and if any member shall allow his dues to remain unpaid for a year, he shall be considered, unless he be absent from the United States, as having forfeited his membership. No member shall be entitled to any of the privileges of the Club until his dues are paid.

Article X.—Honorary Members.—Any person shall be eligible to be elected an honorary member who shall be approved of at a general or special meeting.

Article XI.—Executive Committee.—The general government of the club, and the supervision of the club house and the property thereof, shall belong to an Executive Committee of five, of which the Commodore, Vice-Commodore and Secretary shall be *ex-officio* members, and the remaining two shall be active members of the club, and shall be elected at the last general meeting of each year. All regattas shall be under the control of a committee of five, to be appointed by the Commodore.

Article XII.—Amendments.—This constitution may be amended at any meeting; but no amendment passed at any general or special meeting shall be valid until approved at a subsequent meeting; and any amendment must be submitted at a general meeting.

BY-LAWS.

Chapter I.—Notices.—Notices shall be sent to every member, of all meetings, at least five days before such meeting.

Chapter II.—Representatives.—Any active member may authorize any other active member to vote for him by a written proxy, which shall be valid for that meeting only.

Chapter III.—Order of Business.—(1.) Minutes; (2.) Treasurer's report; (3.) Election of members and officers; (4.) Committee reports; (5.) Miscellaneous business; (6.) Adjournment.

Chapter IV.—Pendants.—The Commodore's signal shall be a broad pendant, with two crossed paddles encircled by four five pointed stars in white, on a blue field. The Vice-Commodore's shall shall be a broad pendant, with a similar device on a red field. The Acting Commodore will have a broad pendant, blue field, without device.

Chapter V.—Signals.—The distinguishing signal of the club shall be a pointed burgee, its width being two-thirds of its length (length, one inch for each foot of length of deck); the device being * * * * * * * Each canoe is required to have a distinguishing signal flag, such signal to be rectangular, and same width and length as club signal.

Chapter VI.—Senior Officer.—In the event of the absence of the Commodore and Vice Commodore, the oldest member of the club, being at the time a canoe owner, shall be considered the senior officer and acting Commodore.

Chapter VII.—Expulsion.—Any member may be expelled by the vote of the majority of active members at any general meeting.

Chapter VIII.—Amendments.—These by-laws may be amended at any general or special meeting.

THE CONNECTICUT RIVER MEET.

ON May 30 and 31 the Hartford and Springfield Canoe Clubs will hold their second annual meet on the Connecticut River, at Calla Shasta Grove, six miles south of Springfield. This beautiful grove is on a bluff overlooking the river, which at this point widens into a splendid sheet of water that resembles a lake more than a river, because three miles north of the grove and four miles south there are curves in the river that give the outline of an oblong lake and retards the current so as to give almost slack water.

The five-mile sailing course is in full view of the camp, and can be used favorably in either of the prevailing winds, viz., northwest or southwest. There are also a fine pavilion, swings, bath-houses, superb camping ground, an open spot for games, etc., also a cook house well supplied with the necessary furniture.

At a meeting of the Springfield C. C. on May 19 all arrangements were perfected for the entertainment of our guests, who write that they will certainly bring twenty canoeists, and may show up with twenty-five. They leave Hartford Thursday night by steamer, and we hope to join them with twenty men from our club. A showing of forty canoes at a local meet of two clubs is rather suggestive of "canoe fever well developed" in this region.

We have every reason to expect a grand pow-wow and camp-fire, when it is known that fourteen of the Hartford C. C. members are also members of a famous banjo team, and said fourteen men will bring banjoes with them, and, reinforced with other instruments and a chorus of good voices, they will alternate with the usual camp stories and camp experiences. The Hartford men will remain in camp until Sunday, and then set sail down river, a distance of about twenty-five miles. Springfield will break camp Monday morning. GERI.

SPRINGFIELD, Mass., May 20.

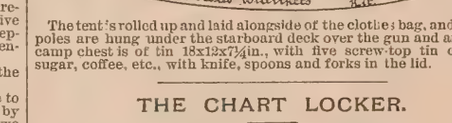
THE HUDSON RIVER MEET.

PRIZES FOR THE RACES.

THE meeting of canoeists on Newburgh Bay on the 30th of this month promises to be of a very interesting and pleasant character. Paddlers and sailors from the New York, Albany, Rondout, Knickerbocker, Lake George and other clubs, besides many unattached canoes will be present. A number of races will take place and the canoeists of the city have gotten up four elegant prizes which they will present to the winners. They are now on exhibition in the windows of Mr. N. S. Smith's book-store, No. 76 Water street, and their beauty is attracting a great deal of attention. The prizes consist of four flags, made of heavy silk, two of deep blue and two of crimson. In the center of each is a charming painting in oil, one a perfect picture of Washington's headquarters, the other three being views of the Highlands from different points on the river. Each picture is oval and is a gem of art. Paddles and boat hooks, the emblems of a canoeist, are crossed behind each painting, while cat tails and broad-leafed lilies are gracefully arranged on each side. "Newburgh, 1884," is painted in antique letters on the front of each, and on the reverse side, "Won at Newburgh, 1884," is printed in small letters. The flags are all of the regulation size, 10 by 15 inches, and are bordered with a heavy silk fringe, of a deep gold color, two inches wide. They are finely mounted on black walnut staffs, with a gold spear head. Nothing could be more elegant and appropriate for the occasion, and there will no doubt be a strong and earnest contest for their possession. The flags were gotten up by Mr. N. S. Smith, with whom the idea originated, and were painted by Mr. Thomas B. Pope, artist of this city. It is expected that no less than seventy-five canoeists will participate in the meet, which will continue for three days.—*Newburgh Daily Register.*

THE MERRIMACK RIVER MEET.

Editor Forest and Stream:



I notice by your columns that there is to be a canoe meet on the Merrimack, June 14 to 17. The location chosen for a camp is unsurpassed, being high and dry, there are two fine cold springs of water just below the camp, and one, with a cold brook fed by springs, just opposite. Both sides of the river are bounded by hills covered with pine, hemlock, and a great variety of deciduous trees. Not a house can be seen, but only woods, fields, ledges and the river. Back of the woods are a few farmhouses where milk, etc., can be obtained.

Have also been informed that many different styles of canoes will be present, birches, canvas and wooden boats. It is to be hoped that all canoeists who can will be present and test the relative merits of the various kinds of craft. There is a fine expanse of smooth water for racing. J. H. TREAT.

LAWRENCE, Mass.

STOWAGE OF CANOES.

THE limited room in a canoe makes the problem of stowage a serious one, especially to the novice; how to utilize each inch of space, and yet have everything as nearly within reach as possible. The accompanying sketch shows the plan followed by Captain Kendall in his canoe Solid Comfort. The dimensions of the boat are, length 14ft. 2in., beam 36in., height amidships 9in., sheer forward 6in., aft 4in.

The tent's rolled up and laid alongside of the clothes bag, and the tent poles are hung under the starboard deck over the gun and axe. The camp chest is of tin 18x12x7¼in., with five screw-top tin cans for sugar, coffee, etc., with knife, spoons and forks in the lid.

THE CHART LOCKER.

X.—MISSISSQUOI RIVER.

IS this river navigable for canoes from Lake Memphremagog to Lake Champlain in July and August?

HARVARD C. C. SPRING RACES.—The first set of races of the Harvard C. C. on Charles River course came off to-day (24th) very successfully. The weather was perfect, a stiff breeze giving good opportunities for showing skill in handling canoes. The first event was a sailing race, two miles on and off the wind; six men started. The start was lively, owing to the strong wind. Three had to drop out in a short time. T. Dunham, '85, led the whole race and came in first; E. L. Hand, of Law School, second. Time of whole race not taken, but Dunham covered the last mile in eight minutes. The second event, paddling, in tandem, three-quarters mile, had five entries, and it was close and well contested. P. L. Livingston, '85, first; A. G. Webster, '85, second. The third event, paddling in tandem, three-quarters of a mile, had two entries: Frothingham, '84, and Livingston, '85, against Dunham, '85, and Webster, '85. A very close race was won by Frothingham and Livingston by several lengths. The fourth event, upset race, had three entries. The race was very amusing. Webster, '85, first; Dunham, '85, second. Prizes, silver cups. Referee, Mr. F. A. Mason, '84. Judge at stake, Mr. W. L. Everett, '85.—*N. Y. Herald.*

LAKE GEORGE C. C.—Canoe affairs are moving along splendidly. A new and commodious club house is under construction, and will be ready for occupancy in a week or ten days. It is situated at Glen Lake, three miles from Glens Falls. This little gem of a lake is a mile and a half long by three-fourths in width, abounding in black bass, perch and pickerel, and during the migratory season with ducks. A carry of about ten rods brings one to the "bull-heading" ground, where this not unpalatable fish is caught as fast as the hook can be baited. The shore is beautifully wooded, and in fact, the spot is "too lovely for anything," so she said. With such attractions one cannot wonder at the regularity our members are seen en route, afoot and walking, to their favorite rendezvous. The uniforms will be furnished in about two weeks. New members are joining, and withal the club is in a very satisfactory and flourishing condition.—HAWKEYE (Glens Falls, N. Y., May 26).

THOSE RUSHTON CANOES.—*Editor Forest and Stream:* I was both amused and vexed with "O. K. Chobee's" article in FOREST AND STREAM of May 22. That I built *canoes* 14ft. 6in.×42in. was soniething new to me. That "O. K. Chobee" should call an open pleasure boat 14ft. 6in.×42in., a canoe was amusing. That my "canoes" of 42in. beam should be so badly beaten by Psyche was vexatious. I do not know that I ever built a boat 14ft. 6in.×42in., but last winter I sold two *pleasure boats* 15ft.×42in. to a gentleman in Mandarin, and I suppose those are the "canoes" referred to. I often fit these boats with Atwood centerboard and a small sail, but never had any idea of their being raced against first-class sailing canoes; when they are they should be reported as pleasure boats, not canoes.—J. H. RUSHTON.

PHILADELPHIA TO NEW YORK BY CANOE.—Messrs. Norton and Howard, of the New York C. C., made the trip from Philadelphia to New York in the tandem canoe Kittiwake, leaving the Schuylkill River on Monday, May 19, halting one night at Burlington and one at Kingston, and arriving on the third night at South Amboy. Here the boat was stored, the crew coming to New York by rail. On the 27th, they returned to South Amboy by rail, were under way at 2 P. M., and reached West Brighton at 8 P. M., stopping for the night with Mr. Stepheus. On Wednesday morning the voyage was completed by a short paddle to the N. Y. C. C. house. The cruise was diversified by an upset, caused by the tow line of a boat on the Delaware and Raritan Canal.

LEAKS IN BIRCH BARK CANOES.—*Editor Forest and Stream:* In issue of 1st inst. a recipe for stopping leaks in a birch bark canoe is asked for. Boil rosin and oil together, smear some of the mixture hot on the bark, lay smooothly over it a piece of strong cotton, or light duck, large enough to cover the leak, then more of the mixture over the cotton. Let the rosin cool before launching and the leak is effectually stopped. [In "Wenonah's" receipt for stopping leaks in birch bark canoes in last week's issue, the amount of tallow should be two ounces instead of one, as printed.]

NEPTUNE C. C.—The Neptune C. C., of Newark, N. J., organized in April with twenty-five members, have built a club house on the Passaic River at Newark, N. J. The club's new officers are: Commodore, George O. Totten; Vice-Commodore, L. Thorn; Secretary, Harry T. Freeman; Purser, Edward A. Alston.

A QUICK RUN.—The canoe Rambler, owned by Mr. Lyman R. Ingraham and attached to the Hartford club, recently sailed from Hartford to Middletown, twenty-two miles, in one hour and fifty minutes.

OTTAWA C. C.—This club now numbers thirty-six active members. The officers are: Captain, R. W. Baldwin; Mate, E. King; Purser, J. H. Henderson.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

F. B. W.—We do not know where you can buy rubber decoy ducks.

MAX.—We know of no journal devoted to the subject. Thanks for address.

F. D., East Toledo, O.—We have heard the region highly spoken of as a deer region.

K. A. N., Brooklyn, N. Y.—"Practical Canoeing," by Tiphys; price, $2.50; can furnish it for you.

F. W. S., New York.—There is no shooting to be had at this season in the vicinity of New York.

F. M. M.—A 10-bore is usually considered to have some advantage over a 12-bore in trap-shooting.

SUBSCRIBER.—Address of portable house makers is American Portable House Mf'g Co., Corona, N. Y.

F. H. H.—The book "Camp Life in Florida" was compiled from the columns of the FOREST AND STREAM. It is now out of print.

A. G. W., Cambridge, Mass.—Provisions for cruise, about $3 per week. See the FOREST AND STREAM of April 3, 1884, for aprons.

SUBSCRIBER.—Where can I get a day's trout fishing on a Long Island preserve near the city? Ans. Try Carman's ponds at Amityville.

CONSTANT READER, New York.—Can you let me know where I can have some large bullfrogs (living)? Ans. Write Mr. E. G. Blackford, Fulton Market, New York.

W. S.—How can I remove tan and sunburn? Ans. Keep out of the sun and in time the tan will wear off. If skin is burned by sun so that it is painful, apply glycerine or vaseline.

O. C. M. A., Dorchester.—A strong paper is specially made for paper boats; we do not know where it can be had; 14×30 would be better; we cannot tell the proable cost of material.

P. L., Jobstown, N. J.—The best baits for carp are worms, boiled peas, and wet cotton, into which flour has been worked. They are very wary and no sinker to make a splash should be used.

J. D. B., N. J.—1. When is the law up on black bass in New Jersey? 2. Where is a good place to go for them within three hours from New York city? 3. What are the best baits? Ans. 1. June 1. 2. Lake Hopatcong or Greenwood Lake. 3. Helgramites, minnows and frogs.

C. F. L., Cincinnati.—The title of the book by "Stonehenge" is "The Modern Sportman's Gun and Rifle." The first volume treats of the gun; the second (not yet out) of the rifle. Price per volume $6. We can furnish the first to order, will take about three weeks to import.

E. B. V. G., Pittsburgh, Pa.—Hoy's Wilderness is reached via Oakland, West Virginia, on the Baltimore and Ohio Railroad. There used to be good trout fishing in Hoy's Wilderness or Blackwater region, and we presume there is now; and there used to be bear, deer and wild turkey shooting. Possibly some reader may supply fuller information from recent experience.

C. B. H.—I have eleven wood duck eggs under a hen. Provided they hatch what will be the most suitable food for the young ducks? Ans. Feed soaked bread at first, but not much corn meal. They should also have some animal food, which they may get if they have a run in the garden, where they will find insects. As they get older they will eat wheat screenings and table scraps.

W. E. W., Lexington, Va.—1. The bird note will receive attention on return of natural history editor. 2. The angle fish is not so named because of his big mouth, but because he is supposed to hold the antennæ in front of him to serve as lures to attract the fish within reach. See Prof. Gill's article on this subject in our last volume, page 229, entitled "Deep Sea Fishing Fishes."

A. C., New York.—Are the fisheries of Greenwood Lake, Stirling Lake and also of Lake Mahopac and St. Mary's Lake public, and what fish are to be caught in these lakes during this month? Ans. Greenwood and Mahopac are public; the others we know nothing of; there is little fishing for anything but black bass in Greenwood, and the season begins June 1; there are perch in Mahopac.

F. W. INGERSOLL.—The Lewis and Clarke expedition was sent out by the Government in 1803, to explore the western territory. They started in the summer of 1803, spent the winter at the junction of the Missouri and Mississippi, in spring, summer and fall of 1804 ascended the Missouri, camped among the Mandans in winter of 1804-5, in July of 1805 reached the three forks of the river, ascended to the source of one of them, the Jefferson, then went to the mouth of the Columbia. Returning, they reached St. Louis Sept. 23, 1806. An account of their expedition was published in 1814, and other editions later. The work is now in great demand and is exceedingly scarce. You might possibly obtain a copy by writing to Mr. Chas. L. Woodward, dealer in Americana, No. 78 Nassau street, New York.

GREENHORN, N. Y.—1. Please tell me what is spinning with the minnow? How is it done, what is the necessary tackle? 2. What is "skittering?" How is it done? What is the tackle? For what fish? Ans. 1. "Spinning" is a term used by English anglers for what would be called "trolling" in America. It is done with a minnow gang, on which the minnow is so placed that it revolves or spins, as it is drawn through the water. A stiff rod is used and the bait is cast and drawn to the right or left. 2. "Skittering," we believe, is an American term for casting a minnow and making it skip or "skitter" on the water by quick jerks, much as boys make flat stones or shells skip on the surface of a pond. Both spinning and skittering are done for pike (New York pickerel) and occasionally for black bass.

YOUNG TENDERFOOT, Philadelphia.—1. What size and kind of rod, hooks and line for trout and black bass (bait-fishing) would you advise me to get? 2. Can you recommend "Hallock's Sportsman's Gazetteer" as a practical guide for a tyro? 3. Did Mr. T. S. Steele, author of "Canoe and Camp-ra," make the 200 mile Maine trip in an Osgood folding boat, and afterward recommend them by affidavit? 4. Can you give me directions for skinning and preserving snake skins? Ans. 1. Get an 8 to 10-foot ash and lancewood rod, a good reel, a waterproof silk line, and sproat hooks, Nos 5 to 7. 2. Yes. 3. He made the trip in an Osgood boat, but we don't know anything about an affidavit. 4. If for belts, cut the snake down the abdomen and skin. Take it to a tanner and have it tanned, unless you are an adept at tanning.

A Palace-Prison; or, the Past and the Present.—A novel. New York: Ferds, Howard and Hulbert. The story is of a young girl immured in an insane asylum, where by the fiendish devices of superintendent and attendants she becomes hopelessly insane. A book like this one ought to open the bars and let out the victims who are sharing the horrible fate of the heroine.

PUBLISHER'S DEPARTMENT.

SPORTING BOOKS.—Mr. J. W. Bouton, of No. 706 Broadway, announces a rare collection of works on angling, shooting, the horse, hunting and yachting. Elsewhere see his card.

THE CONEY ISLAND SEASON has opened and New Yorkers are happy once more. The great bulk of the travel thither is over the New York and Sea Beach Railway, which connects with Battery boats.

ORIENTAL.

CANTO I.

One night, the poor disconsolate
Young heiress in her boudoir sate,
"Would I were beautiful, or dead!"
"Why so?" asked Jenny. "Don't you see
De Smyth won't fall in love with me!
What's gold to me? What's jewels? What
The splendid mansion I have got?
With half my wealth I'd gladly part,
If I could win my Alfred's heart."
"Give me a thousand dollars, Miss,
And you shall have that much prized bliss."
"One thousand! Jenny!" Julia said,
"I'll double that the day we're wed!"
"'Tis done!" exclaimed the lady's maid,
"And don't go back from what you've said."

CANTO II.

That night, the magic rites begin,
With a mysterious compound, which
Made her complexion white and rich;
Freckles and pimples faded away,
Like darkness, at the smile of day.
"How was it done?" now fair Julia cries.
"I'll tell you how," the maid replies;
"That peerless skin's bright snowy gleam
You owe to *Oriental Cream*,"
To close the story, let me say
The pair were married yesterday,
And sent, for darling Cupid's sake,
(Gouraud T. Felix) a mighty slice of cake.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JUNE 5, 1884.

VOL. XXII.—No. 19. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.

POINTERS AT NEW YORK.

THAT the judging of the pointer classes at the Westminster Kennel Club show was received with surprise and dissatisfaction by a large majority of those interested, is well known. As a consequence of this we have received a great number of letters bearing on the subject. Of these a very considerable number contain no statements of argument or fact, and will therefore never make their appearance in these columns; others, which deal liberally in reckless accusations, of "hatred, malice, and all uncharitableness" on the part of other writers, will also fail to appear in type, while a third class, devoted to the laudation by their owners, of certain champion stud dogs, can only be printed at our usual advertising rates.

It seems too often impossible for men to discuss the faults and merits of the dogs which they own in a temperate and common sense manner. If X. criticizes Y.'s greyhound as having a bulldog head, Y. is very likely to reply that X.'s paternal grandfather made his money in the slave trade. Reason, logic, and common sense appear to be thrown to the wind when it comes to a question of a dog's qualifications for the show bench. It is not difficult to see why this is the case. The explanation, of course, lies partly in the warm affection which exists between the dog and his owner. No one of the lower animals is so near to man as the dog, and in many cases the love with which it is regarded is not very different from that feeling which a man has for his children. So it is that very often when a man attempts to write in defense of his dog he is so strongly moved that he will use any weapon, however puerile, which he thinks may serve his purpose. And yet it ought to be possible for men, who in the ordinary affairs of life are sensible enough, to employ their intelligence in considering a question where their feelings are so deeply engaged. They ought not to write like children, and when they do so it will be a waste of good postage to send their letters to this office.

Mr. Mason's criticism of the pointer judging was temperate and quiet, devoted wholly to pointing out what he considers the faults in the individual dogs, and so a model of its kind. The replies to it should be in the same strain, and it is certainly unnecessary that they should contain anything more than the judgment of the writer on the animals discussed. After all this judgment will be nothing more than an expression of opinion, for we have no model, no perfect dog with which we can compare the living animal. Each man in looking at a pointer for example, will have a different idea as to the faults of this particular dog. One man will think that his chest is just right, while another will consider it not deep enough, and a third too wide, and to a positive statement as to faults of this kind there seems to be no reply except a reference to authorities which can not settle the question because their statements are susceptible of widely differing interpretations.

Another reason why men find it impossible to reason temperately about the bench show qualities of their dogs is that the average man appears to be utterly unable to appreciate that excellence on the bench and excellence in the field may be, and often are, two utterly diverse things. A bench show winner may be a good field dog, or he may be utterly worthless to shoot over, but there are thousands of dogs which it is a delight to follow afield in the autumn days, but which, if entered in a bench show, would be laughed at by every one. Yet, we often hear a disappointed exhibitor say, "Well, my dog ought to have had a place, he is a superb dog on ruffed grouse!" Such people ought to know enough to keep their dogs out of bench shows, and so save themselves expense and much anxiety. A dog's field qualities depend largely on characters which are mental and are susceptible of cultivation. They are more or less dependent on outside circumstances, but a dog's bench show qualities are purely physical, and can scarcely be modified at all after the animal has matured. Bench show qualities are, in a measure, the result of breeding, yet the most careful breeding may produce animals which have the gravest faults. Therefore accident, or some unknown quantity which we cannot as yet determine, usually decides what the young animals shall be.

We urge upon our correspondents interested in kennel matters, the importance of moderation in their discussions, and for ourselves we must decline to admit to our columns any bitterness. The virulence of these quarrels, as sometimes carried on in our contemporaries, cannot but give sportsmen generally the impression that dog owners and breeders are a quarrelsome and ill-conditioned lot, and that like their favorites so much maligned by good old Dr. Watts, they

> * * * "delight
> To bark and bite
> For 'tis their nature to."

THE WILD DOGS OF MAINE.

LET the dakhun hide in the shadow of Cheops, and the cuansu slink abashed into the jungle; let the polugar dhole drown in the Ganges, and the pariah flee to Himalayan fastnesses; let the pero get him to the uttermost antipodes, and the dingo crawl into a hole. The dogs of Maine are wild. So pronounces the Supreme Court of that State. Dogs (wild and tame) sometimes go mad; Supreme Court judges never lose their reason.

The learned gentlemen whose opinion on this point is elsewhere given in full, have performed a courageous and momentous task. We term it courageous. It is. Upheld and inspired by their keen vision into the arcana of canine philosophy, the Maine judges have dared to stand in the face of the common sense of mankind in this year of grace 1884 and declare that the dog—"man's best friend"—is a wild beast. The pet that plays with the children, the old house dog that has been a faithful guard so long, the pointer and setter, fine bred and trained, all these belong with the bear, the wolf and the 'coon, to the *feræ naturæ*.

We are surprised that certain citizens of Maine, who style themselves sportsmen, are disposed to be enraged at the dictum of the judges. Clearly these fault-finders do not fully comprehend what a glorious thing this is for the game supply. In decimating and exterminating Maine game the dog has taken an active part. He has run the deer and pointed the grouse. "Now," reason the judges, "we will have a bit of retributive justice. The dog has helped to destroy the game, we will make game of him. There is little else to hunt, let us hunt the dog." This, it will be observed, fully exempts the judges from the very serious charge made against them, namely, that "they are no sportsmen." On the contrary, they must be sportsmen, and the very truest sort of sportsmen at that. While other sportsmen, glowing with earnestness, have been devising various more or less impracticable schemes to conserve the game, the Supreme Court worthies have grappled the problem and solved it on the instant by transforming into savage beasts the tens of thousands of formerly inoffensive and presumably domestic animals. The novelty of this class of game may lead to much perplexity of spirit among those who desire to hunt dogs in a decent and "legitimate" manner. The ethics of the sport are little understood, and it will take some time to learn what is the approved fashion of dog pursuit. Perhaps the gentlemen who hunt the metropolitan curs might be induced to go to Maine and instruct the rising generation in their art.

We congratulate the hunters of Maine upon this sudden and magnificent addition to their wild game supply. It is to be hoped that enthusiastic dog hunters will not recklessly engage in the exciting and ennobling pursuit of shooting the game. The dog is, of all wild animals, the most confiding. In some parts of Maine, we are credibly informed, he ventures in broad daylight into the barnyards, and even now and then into the kitchens of the farmhouses. These habits render it very easy for the circumspect gunner to approach him. If every man and boy who happens to own a gun goes out to shoot dogs, it stands to reason the supply will be decimated in less than no time, and before long the Maine wild dog will go the way of the dodo and the snakes in Ireland.

It is imperative that a close season should be provided, during which no dog should be killed; and it might be well to add a clause forbidding at any season the exportation of dog quarters to the Boston sausage market, or of their hides to the New York kid-glove factories. We are quite content to leave this matter of a dog season to the sportsmen of Maine, merely suggesting that they have now an opportunity to provide an abundance of game for the professional gentlemen who take their vacation in mid-summer. There is no special reason why the dogs should not be shot at that season; and it is probable that those who enjoy shooting the doe with fawn would take kindly to the sport of dog shooting.

An exception should be made in favor of the yellow dog. He ought to be protected all the year around, and be given every encouragement to increase and multiply, in the hope that in some way, at some time and in some place, a yellow dog and a Maine Supreme Court judge may meet, for the judge might learn something from the dog.

THE REWARD OF VIRTUE.

ONE of the most mysterious features of angling, to one who has not the gift, is the patience with which a man will sit at the end of his rod, hour after hour, and half a day or a day at a time, though never a nibble nor a rise gives him encouragement. The uninitiated are wont to scoff at such perseverance; they are always ready with a dozen or two other things that a man might well better give his time to than dangling a bait-line or throwing a fly. Leave such wiseacres to their conceit. The patient angler is wiser than they. He knows that after all the waiting there may yet come the reward. Perseverance is his cardinal virtue. Hope springs eternal in the angler's breast. And if the fish is not finally creeled, if the long vigil has been without tangible fruition, yet is he not without compensation, for has he not all day long been indulging in the pleasures of hope? To-morrow, perhaps, he will prove again not only the joys of anticipation, but the satisfaction of basketing a fish as well; and so to-morrow you will find him once more at his post.

It is a pleasant little story that comes to us from a correspondent in Vermont. A St. Albans angler went out the other day to try his luck for speckled trout at Fairfield Pond. He began fishing at 10 o'clock; 11 came and he had had no sign that there was a fish in the pond. The sun climbed to the meridian; 1 o'clock, 2, 3, went by, and still no fish. Finally, at half past 3 there was a rise, a strike, and a 5½-pound trout in his basket. He had been fishing five and one-half hours. The catch averaged just one pound to the hour. He felt amply rewarded for the day's work. There are all varieties of tastes and shades of sentiment among anglers; and it might not be universally conceded that this was very good fishing. Some anglers might contend that they would prefer their five and one-half pounds of trout in installments at more frequent intervals, while there are others who would choose the luck of the Fairfield Pond man. In their scale of merit, one five and one-half pound trout tips down the beam against a bushel of fingerlings.

HYDROPHOBIA.—A lawyer of Goshen N. Y., who is also an angler, gives it as his deliberate opinion that the average citizen stands a better chance of being blown to flinders at the mouth of a cannon than of being bitten by a rabid dog. He is right.

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

I.

AFTER his adventures with the bear, which some of the readers of FOREST AND STREAM may remember, Uncle Lisha Pegg's shop became a sort of sportsman's exchange, where, as one of the fraternity expressed it, the hunters and fishermen of the widely scattered neighborhood met of evenings and dull out-door days "to swap lies." Almost everyone had a story to tell, but a few only listened and laughed, grunted, or commented as the tale told was good, bad or of doubtful authenticity. And so one October evening, as the rising hunter's moon was streaking the western slopes with shadows of evergreen spires and long paths of white moonlight, Uncle Lisha's callers began to drop in by ones and twos. The first comer got the best seat, the broken-backed chair, the next the second best, so accounted, the chair with three legs, though the occupant had to give so much thought to the keeping of his balance, that he sometimes tumbled to the floor when the laugh came in. The later comers had the choice of seats on a roll of sole leather, the cold box-stove, or a board laid across the tub in which Lisha soaked his leather, and the latest the floor with the privilege of lying at length upon it or setting their backs against the plastered wall. So were disposed a half score of the old cordwainer's neighbors, thus far doing little but smoke, chew and silently watch Lisha as he hammered out, shaped and pegged on the tap of a travel-worn boot as intently as if they were taking lessons in the craft, when Antoine Bassete entered with a polite "Good evelin, Oncle Lasha; good evelin, all de ghoute mans." Then as he looked about he drew forth from one pocket his short black pipe, from another his knife with which he scraped out the pipe and emptied it on the stove hearth, then he got out from another a twist of greenish-black tobacco, and whittling off a charge and grinding it between his palms, filled and lighted his pipe at Lisha's candle with such sturdy pulls that the little dip seemed likelier to be quenched than to longer "shine like a good deed in a naughty world."

"Git aout! ye dummed peasouper," Lisha shouted, after pounding his fingers instead of a peg in the uncertain light, "you'll hev us all in total moonlight fust ye know! Take a match er a splinter an' light yer pipe like white folks, stiddy suckin my candle aout. Don't ye know what the feller said at was goin' t' be hung in ten minutes, when they gin him a candle t' light his pipe with? He says, sez he, 'gimme a match if ye please, 'taint healthy t' light a pipe with a candle' sez he. Take keer 'f yer health, Ann Twine, f' that 'ere Canady Gov'ner 'll want ye t' be wuth hangin' when he gits a holt on ye."

"Hah, naow, Oncle Lasha," said Antoine, "dat wus too bad faw you talk so to me. Who help you w'en dat bear keel you, hein?"

"Wal, yes," Lisha rejoined, "ye did help, sartin; the bear an' I done the fightin' an' yeou done the runnin'. Yeou larnt how to dew that in the Pap'neau war, an' ye larnt it well, Ann Twine; ye don't need no more lessons."

"Wal ah do seh! Ah wan' some bodee show me haow ah run wid dem boot you mek me 'f ah don' cah heem in mah han' an' den he pooty heavy. But, gosh! wa' heem on may foots? Ah, jus' leave wa' two store like dat. He be jus' so sof', jus' so not heavy."

"Haow d' ye 'spose any body could fit yer dummed Canuck feet arter ye'd wore souyaas ever sen' ye was weaned, ker-splash, ker-spotter, till yer feet 'as wider'n they was long? Yeou git ye some babeesh an' I'll give ye ten sides o' sole luther, an' then ye can make ye some souyaas, 'n' then put on yer ole trouses 'l ye could carry a week's p'vision in the seat on, an' be a Canuck; ye can't be a 'Merican, no ways."

"Ah, Oncle Lasha! You pooty bad hole man. Haow you feel dat time you tink you dead? Wha' yo tink you go? A'nt you sorry you don't was been mo' gooder? Wha' you tink you go, hein?

"I do' know," Uncle Lisha slowly responded; "but I hoped I'd go where the' wa'n't no Canucks!"

"Dah! dah! Oncle Lasha; you so weeked no use talk to you," cried Antoine, when the laugh in which he joined had subsided; "'f you tole dat leet' story you beegin dat night, ah won't said no mo'; you leave off rat in meedle w'en de bear shoot heself, an' you see ah got so Yankee ah mos' come dead 'cause ah do' know de ca' of it. Dat story, you know, 'bout man dot cut bread so fas' wid shoe knife. You 'membry?"

"Le' me see," said Lisha, scratching his head with his awl; "oh, yes, I remember. Wal, I s'pect that's a true story, Ann Twine, an' 'f I tell it ye got t' b'lieve it."

"Oh, sartin, Oncle Lasha; ah don' b'leeve you tole lie no more as ah do; no, sah."

"Humph!" Lisha grunted, "I never knowed but one Canuck but what 'ould lie."

"An' dat was me, Oncle Lasha?"

"No, sir! He was a dead one! Wal, the' was a shoemaker 't lived in Connecticut, an' my father knowed him, 'at he'd a knife julluck this"—holding up his longest knife—"the cutest thing t' cut bread with 't ever was, but he wouldn't let nob'dy but his own self use it, so they use ter send for him to all gret dinins t' cut the' bread fer 'em. Wal, arter he'd ben a cuttin' raoun' for three, fo' year, they sent fer him one July to go t' Colonel Leavenworth great shearin'. He kep a thou-san' sheep, an' hed twenty shearers, an' made a big splonto, 'wine in quart mugs an' strawb'ries rolled in cream,' he use ter brag about, but they wan't on'y pint mugs 'n not filled very often at that, an' the wine was cider, an' the' wan't more 'n tew strawb'ries a piece, 'n' they was dried apples. Wal, the shoemaker come with his knife keener 'n ever, an' the han's and comp'ny hed all got washed up for dinner with the' clean clo's on, an' stood 'raound watchin' on him cut the bread, ker slice, ker slice, faster 'n a gal could pick up the slices, off 'm a loaf 't he hel' agin his breast. He done it so neat 't they cheered him, which he got kinder 'xcited an' tried t' cut faster 'n ever, an' the next lick he gin the loaf he cut hisself clean intew, an' the man 'at stood behind him clean intew, an' badly wounded the next one. They sot tew an' stuck 'em together so 't they lived, but it spilte the shoemaker's bread cuttin' business, an' he hed to go back to shoemakin' an' starvin', julluck me."

"Wal sah, Oncle Lasha," cried Antoine, emphasizing every word with a gesture, "ah b'lieve dat story, cause ah promise, balt ah tink t'was 'cause you goin' tole it dat bear scrape you so bad. You see, sah, bear is send for punish bad folkses. An't you hear haow bear keel fawty leetly boy 'cause dey call hole man he don' got no hair on top hees head of it—what you call heem—ball? Ah spec' dey be nudder bear long 'fore soon for ketch hole man what tole such story, an' den tell Frenchman he don' lie honly w'en he dead!"

"Good airth an' seas!" Lisha roared, "I dew beleeve one on 'em would hev the last word 'f he was deader 'n a door nail. Wal," he continued, as he put his tools in their places and took off his apron, "it's 'baout time 'l honest folks was abed an' rogues locked aout, but you needn't hurry none 'baout goin' t' bed, Ann Twine."

Ten minutes later the shop was dark but for the patch of moonlight that shone in through the little window set longwise of the room, and the visitors scattered to their homes.

AWAHSOOSE.

ADIRONDACK FISH AND GAME.

THE snow and ice are now all out of the Adirondack woods south of this place, excepting in some few of the deepest and most shaded ravines or valleys, and the trout are now biting freely in all the streams and ponds. A fine string of about thirty pounds in weight was taken this week out of the Twin Ponds by two young men of this place. The largest was seventeen inches in length and weighed two pounds thirteen ounces. A number of fine lots have been taken out of the St. Regis River near Blue Mountain during the past week.

In a former communication to the FOREST AND STREAM I stated that a railroad was being built from this place to some point in the Adirondacks south from here. This road is now completed from here to Spring Cove, on the middle branch of the St. Regis River, distant from here twenty miles, and is within four miles of Blue Mountain, and six of the foot of the sixteen-mile level. Passenger trains are running to St. Regis Falls, eleven miles from here, which connect with passenger trains on the Ogdensburg and Lake Champlain road at this junction. Lumber trains run over the remainder of the road from the Falls to Spring Cove, on which parties visiting this region can get themselves and baggage carried after arriving at the Falls. During the coming summer the road will be extended to River Pond on the sixteen-mile level, which place is about ten miles west of Paul Smith's Hotel at St. Regis Lake.

The building of this road makes the region about the headwaters of the St. Regis River the easiest of access of any portion of the Adirondacks where game and trout are still to be found at all plentiful. Spring Cove, the present terminus of the road, is itself in the heart of a good hunting and fishing locality, where scores of deer have been killed and many fine creels of trout caught during the past three or four years, and the sixteen-mile level, only six miles above, is one of the best waters for trout fishing I know of that does not require a tramp of several miles on foot to reach it; and is also a noted place for deer hunting, the great extent of unbroken wilderness on both sides of it making it a great resort for those animals. There are also several other streams and a number of ponds in this region which are not so easy of access—all of which contain trout—and heretofore have been but little frequented by sportsmen or anglers.

For the last five years the sixteen-mile level has been my camping ground through the greater portion of each season. Last season I found as good trout fishing there during July and August as I ever found before at any time or at any place. I found no better twenty-five and thirty years ago when I first began to frequent the Adirondacks. I caught ten trout that all together weighed thirteen and three quarter pounds, and I must have caught fifty to sixty weighing half a pound or over. The most of these I caught fly-fishing mornings and evenings out of a pool in front of my camp. I could have caught ten times the number had I wished. I camped alone most of the time and did not want to catch more than I wished for my own use and occasionally a mess for a party who fished only with bait and could not catch any at that time in the season. There is only now and then a day during the last half of July and through August that sunken bait can be used with any chance of success in these waters.

Sportsmen and anglers will for one or two seasons at least, find better hunting and fishing, I believe, in this region, than in any other part of the Adirondacks that will not require a ride in a wagon of fifteen or twenty miles over a rough road to reach. At Spring Cove is a boarding house, where meals and a bed can be procured if wanted. But at Blue Mt. Hotel, four miles further south, good accommodations can be had by the week or day, and Mr. Henry Phelps, the proprietor, keeps boats and will furnish guides at a moderate charge. The greatest objection is that it is three miles from the foot of the sixteen-mile level, the nearest water navigable for boats. The river is but half a mile below the house, but here are rapids, and although it affords good fishing from the banks, it is not so favorite a resort for anglers as the sixteen-mile level and the nine-mile at Spring Cove, where boats can be used. Mr. Phelps also keeps boats at McCavanaugh, Long and Wolf ponds, which are distant three to eight miles from the house. If the angler is willing to take a tramp through the woods four or five miles on foot, he can find as good trout fishing in a number of waters in this region, where the trout are as plenty in them to-day as they were fifty years ago, or as plenty as they were in the Bigosh in its palmiest days. But if the tramp is not taken soon, he will find them like all other localities that are easy of access—a thing of the past—as far as trout fishing is concerned.

Deer are still very plenty all through this region, although hundreds of them have been shamefully slaughtered during the five years that I have made it my camping ground. The majority of them were killed by night-hunters and during the early summer months. I am not prejudiced against, or interested in, any one method of hunting deer more than another, any more than wishing to have game preserved as long as possible within the Adirondacks; and I do not think any disinterested person who has spent the whole or nearly of each season in camp in them, as I have for the past five years, will contradict me when I say that more deer are destroyed by night-hunting than by all other methods combined. I would be pleased to have night-hunting and hounding both prohibited entirely, and still-hunting confined to November, with no extra time allowed to dispose of the venison. As we now have a game protector appointed for this county, I hope the slaughter here out of season will be stopped.

ADIRON ONDACK.

MOIRA, Franklin County, N. Y., May, 1884.

Just returned from a flying trip to the Adirondacks, and although the season has as yet not opened there, the inhabitants are busy preparing for the expected visitors, and it bids more than fair that the coming one will be a lively season.

I spent two days at the upper Ausable Pond in company with Frank C. Parker, the well-known guide of Keene Valley, and Joe Parker, of Brooklyn, who had with him his red Irish setter Victoria. We tried the trout in trolling and hooked three beauties, averaging 35 ounces. The trout in this pond are all speckled ones, and have been caught weighing 4½ pounds.

Early in the season, or up to the 4th of July, the trout fishing in Keene Valley is very good, in John's and Roaring brooks, also in Orbed Brook, a tributary of John's Brook. The writer caught 36 pounds in two days' fishing on Orbed two years since, and 30 pounds last August in two days with the fly, and the fishing there is royal sport. Keene Valley is the place for health and pleasure, and cannot be excelled for scenery and advantages for camping out.

W. L. HOWARD.

BROOKLYN, June 1, 1884.

Natural History.

THE COUESIAN PERIOD.

[By R. W. Shufeldt, Capt. Medical Corps, U. S. A., Chairman Section of Avian Anatomy, A. O. U. Conclusion of the Historical Preface from advance sheets of Coues's "Key."]

THE AUDUBONIAN EPOCH: 1824–1853.

(1824-1831.)

THE *Bonapartian Period.*—A princely person, destined to die one of the most famous of modern naturalists—Charles Lucius Bonaparte, early conceived and executed the plan of continuing Wilson's work in similar style, if not in the same spirit. He began by publishing a series of "Observations on the Nomenclature of Wilson's Ornithology," in the "Journal" of the Philadelphia Academy, 1824–25, republished in an octavo volume, 1826. This valuable critical commentary introduced a new feature—decided changes in nomenclature resulting from the sifting and rectification of synonymy. It is here that questions of synonymy—to-day the bane and drudgery of the working naturalist—first acquire prominence in the history of our special subject. There had been very little of it before, and Wilson himself, the least "bookish" of men, gave it scarcely any attention. Bonaparte also in 1825 added several species to our fauna upon material collected in Florida by the now venerable Titian R. Peale, whose honored name is thus the first of those of men still living to appear in these annals. Bonaparte's "American Ornithology," uniform with "Wilson," and generally incorporated therewith in subsequent editions as a continuation of Wilson's work, was originally published in four large quarto volumes, running 1825–33. The year 1827, in the midst of this work of Bonaparte's, was a notable one in several particulars. Bonaparte himself was very busy, producing a "Catalogue of the Birds of the United States," which, with a "Supplement," raised the number of species to 366, and of genera to 83; nearly a hundred species having been thus become know since Ord laid aside the pen that Wilson had dropped. William Swainson the same year described a number of new Mexican species and genera, many of which come also into the "North American" fauna. But the most notable event of the year was the appearance of the first five parts of Audubon's elephant folio plates. In 1828–29, as may also be noted, Ord brought out his third volume 8vo edition of Wilson. In 1828 Bonaparte returned to the charge of systematically cataloguing the birds of North America, giving now 382 species; and about this time he also produced a comparative list of the birds of Rome and Philadelphia. His main work having been completed in 1833, as just said, Bonaparte continued his labors with a "Geographical and Comparative List of the Birds of Europe and North America," published in London in 1838. This brochure gives 503 European and 471 American species. The celebrated zoologist wrote until 1857, but his connection with North American birds was only incidental after 1838. The period here assigned him, 1824–1831, may seem too short; but this was the opening of the Audubonian epoch—a period of brilliant inception, and one in which events that were soon to mature their splendid fruit came crowding fast; so that room must be made for others who were early in the present epoch.

(1831-1832.)

The Swainsonio-Richardsonian Period.—The "Fauna Boreali-Americana," the ornithological volume of which was published in 1831, made an impression so indelible that a period, albeit a brief one, must be put here. The technic of this celebrated treatise, more valuable for its descriptions of new species and genera than for its methods of classification, was by William Swainson, as were the elegant and accurate colored plates; the biographical matter, by Dr. (later Sir) John Richardson, increased our knowledge of the life-history of the northerly birds so largely, that it became a fountain of facts to be drawn upon by nearly every writer of prominence from that day to this. Each of the distinguished authors had previously appeared in connection with our birds—Swainson as above said, Richardson in 1825, in the appendix to Captain Parry's "Journal." The influence of the work on the whole cannot be well overstated.

Two events, beside the appearance of the "Fauna," mark the year 1831. One of these is the publication of the first volume of Audubon's "Ornithological Biography," being the beginning of the text belonging to his great folio plates. The other is the completion of the bird-volumes of Peter Pallas's famous "Zoographia Rosso-Asiatica," one of the most important contributions ever made to our subject, treating so largely as it does of the birds of the region now called Alaska. The same year saw also the Jameson edition of "Wilson and Bonaparte."

(1832-1834.)

The Nuttallian Period.—Thomas Nuttall (*1786-†1859) was rather botanist than ornithologist; but the travels of this distinguished English-American naturalist made him the personal acquaintance of many of our birds, his love for which bore fruit in his "Manual of the Ornithology of the United States and Canada," of which the first volume appeared in 1832, the second in 1834. The work is notable as the first "hand-book" of the subject; it possesses an agreeable flavor, and I think was the first formal treatise, excepting Wilson's, to pass to a second edition, as it did in 1840. Nuttall's name is permanent in our annals; and many years after he wrote, the honored title was chosen to be borne by the first distinctively ornithological association of this country—the "Nuttall Ornithological Club"—founded at Cambridge in 1873, and still flourishing.

(1834-1853.)

The Audubonian Period.—Meanwhile, the incomparable work of Audubon—"the greatest monument erected by art

to nature"—was steadily progressing. The splendid genius of the man, surmounting every difficulty and discouragement of the author, had found and claimed its own. That which was always great had come to be known and named as such, victorious in its impetuous yet long-enduring battle with that course of the world—I mean the commonplace; the commonplace, with which genius never yet effected a compromise, since genius is necessarily a perpetual menace to mediocrity. Audubon and his work were one; he lived in his work, and in his work will live forever. When did Audubon die? We may read, indeed, "on Thursday morning, Jan. 27, 1851, when a deep pallor overspread his countenance . . . Then, though he did not speak, his eyes, which had been so long nearly quenched, rekindled with their former lustre and beauty; his spirit seemed to be conscious that it was approaching the Spirit-land," And yet there are those who are wont to exclaim, "a soul! a soul! what is that?" Happy indeed are they who are conscious of its existence in themselves, and who can see it in others, every instant of time during their lives!

Audubon's first publication, perhaps, was in 1826—an account of the turkey buzzard, in the "Edinburgh New Philosophical Journal," and some other minor notices came from his pen. But his energies were already focused on his life work, with that intense and perfect absorption of self which only genius knows. The first volume of the magnificent folio plates, an hundred in number, appeared in 1827–30, in five parts; the second, in 1831–34, of the same number of plates; the third, in 1834–35, likewise of the same number of plates; the whole series of 4 volumes, 87 parts, 435 plates and 1065 figures of birds, being completed in June, 1839. Meanwhile, the text of the "Birds of America," entitled "Ornithological Biography," was steadily progressing, the first of these royal octavo volumes appearing in 1831, the fifth and last in 1839. In this latter year also appeared the "Synopsis of the Birds of North America," a single handy volume serving as a systematic index to the whole work. In 1840–44 appeared the standard octavo edition in seven volumes, with the plates reduced to octavo size and the text rearranged systematically; with a later and better nomenclature than that given in the "Ornithological Biography" and some other changes, including an appendix describing various new species procured during the author's journey to the upper Missouri in 1843. In the original elephant folios there were 435 plates; with the reduction in size the number was raised to 483, by the separation of various figures which had previously occupied the same plate; and to these 17 new ones were added, making 500 in all. The species of birds treated in the Synopsis are 491 in number; those in the work, as it finally left the illustrious author's hands, are 506 in number, nearly all of them splendidly figured in colors.

In estimating the influence of so grand an accomplishment as this, we must not leave Audubon "alone in his glory." Vivid and ardent as was his genius, matchless as he was both with pen and pencil in giving life and spirit to the beautiful objects he delineated with passionate love, there was a strong and patient worker by his side—William Macgillivray, the countryman of Wilson, destined to lend the sturdy Scotch fiber to an Audubonian epoch. The brilliant French-American naturalist was little of a "scientist." Of his work, the magical beauties of form and color and movement are all his; his work is redolent of Nature's fragrance: but Macgillivray's are the bone and sinew, the hidden anatomical parts beneath the lovely face, the nomenclature, the classification—in a word, the technicalities of the science. Not that Macgillivray was only a closet-naturalist; he was a naturalist in the best sense—in every sense—of the word, and the "vital spark" is gleaming all through his works upon British birds, showing his intense and loyal love of Nature in all her moods. But his place in the Audubonian epoch in American ornithology is as has been said. The anatomical structure of American birds was first disclosed in any systematic manner, and to any considerable extent, by him. But only to-day, as it were, is this most important department of ornithology assuming its rightful place; and have we a modern Macgillivray to come?

The sensuous beauty with which Audubon endowed the object of his life was long in acquiring, with loss of no comeliness, the aspect more strict and severe of a later and maturer epoch. Audubon was practically accomplished in 1844, the year which saw his completed work; but I note no special or material change in the course of events—no name of assured prominence, till 1853, when a new régime, that had meanwhile been insensibly established, may be considered to have closed the Audubonian epoch—the Audubonian period thus extending through the nine years after 1844.

While Audubon was finishing, several mentionable events occurred. I have already spoken of Bonaparte's "List" of 1838, and of the 1840 edition of Nuttall's "Manual." Richardson in 1837 contributed to the Report of the Sixth Meeting of the British Association for the Advancement of Science an elaborate and important "Report on North American Zoology" relating in due part to birds. The distinguished Danish naturalist, Reinhardt, wrote a special treatise on Greenland Birds, 1838; W. O. Peabody one upon the birds of Massachusetts, 1839. The important Zoology of Captain Beechy's Voyage appeared in 1839, with the birds done by N. A. Vigors. Maximilian, Prince of Wied, published his "Reise in das Innere Nord-America" in 1839-41. Sixteen new species of birds from Texas were described and figured by J. P. Giraud in 1841, and the same author's useful "Birds of Long Island" was published in 1844. This year also the bird volume of DeKay's "Zoology of New York." The Rev. J. H. Linsley furnished a notable catalogue of the birds of Connecticut in 1843. A name intimately associated with Audubon's is that of J. C. Townsend, whose fruitful travels in the West in company with Nuttall in 1834 resulted in adding to our list the many new species which were published by Townsend himself in 1837, and also utilized by Audubon. Townsend's "Narrative" of his journey appeared in 1838; and the same year saw the beginning of a great work which Townsend projected, an "Ornithology of the United States," which, however, progressed no further than one part or number, being killed by the octavo edition of Audubon. In 1837 I first find the name of a friend of Audubon which often appears in his work—that of Dr. Thomas Mayo Brewer, who wrote on the birds of Massachusetts in this year, and in 1840 brought out his useful and convenient duodecimo edition of Wilson in one volume. In 1844, Audubon's last effectual year, the brothers Wm. M. and S. F. Baird appear, with a list of the birds of Carlisle, Pennsylvania, having the year previously, in July, 1843, described two new species of fly-catchers, in the first paper ever written by the one who was to make the succeeding epoch; and it is significant that the last bird in Audubon's work was named "*Emberiza bairdii.*"

Such were the aspects of the ornithological sky as the glorious Audubonian sun approached and passed the zenith; still more significant were the signs of the times as that orb neared its golden western horizon. In the interval between 1844 and 1853, Baird and Brewer continued; Cassin and Lawrence appeared in various papers, and round these names are grouped those of William Gambel, with new and interesting observations in the Southwest; of George A. McCall and S. W. Woodhouse in the same connection; and of Holboll in respect of Greenland birds. The most important contributions were the several papers published by Gambel, in 1845 and subsequently, and Baird's Zoology of Stansbury's expedition, 1852. But no period-marking, still less epoch-making, work accelerates the setting of the sun of Audubon.

THE BAIRDIAN EPOCH: 1853–18—

(1853—1858.)

The Cassinian Period.—While much material was accumulating from the exploration of the great West, and the Bairdian period was rapidly nearing; while Brewer and Lawrence were continuing their studies and writings, and many other names of lesser note were contributing their several shares to the whole result: the figure of John Cassin stands prominent. Cassin was born September 6, 1813, and passed from view in the Quaker City, January 10, 1869. Numerous valuable papers and several important works attest the assiduity and success with which he cultivated his favorite science to the end of his days. I think that his first paper was the description of a new hawk, *Cymindis Wilsoni*, in 1847. Among his most important works are the Ornithology of the Wilke's exploring expedition; of the Perry Japan expedition; and of the Gilliss Expedition to Chili. Aside from his strong co-operation with Baird in the great work to be presently noticed, Cassin's seal is set upon North American ornithology in the beautiful work begun in 1853 and finished in 1856, entitled, "Illustrations of the Birds of California," etc., forming a large octavo volume, illustrated with fifty colored plates. His distinctive place in ornithology is this: he was the only ornithologist this country has ever produced who was as familiar with the birds of the Old World as with those of America. Enjoying the facilities of the then unrivalled collection of the Philadelphia Academy, his monographical studies were pushed into almost every group of birds of the world at large. He was patient and laborious in the technic of his art, and full of book-learning in the history of his subject; with the result, that the Cassinian period, largely by the work of Cassin himself, is marked by its "bookishness," by its breadth and scope in ornithology at large, and by the first decided change since Audubon in the aspect of the classification and nomenclature of the birds of our country. The Cassinian period marks the culmination of the changes that wrought the fall of the Audubonian sceptre in all that relates to the technicalities of the science and consequently the beginning of a new epoch.

The peers of this period are only three—Lawrence, Brewer and Baird. The former of these, already an eminent ornithologist, continued his rapidly succeeding papers and was preparing his share of Baird's great work of 1858; though later his attention became so closely fixed upon the birds of Central and South America, that a "Lawrencian period" is to be found in the history of the ornithology of those countries rather than of our own. Dr. Brewer's various articles appeared, and in 1857 this author so well known since Audubonian times became the recognized leading oologist of North America, through the publication of the first part of his "North American Oology"—a work unfortunately suspended at this point. Though thus fragmentary, this quarto volume stands as the first systematic treatise, published in this country exclusively devoted to oology, and giving a considerable series of colored illustrations of eggs. But a larger measure of the world's regard became his much later, when, in 1874, appeared the great "History of North American Birds," in three quarto volumes, all the biographical matter of which was by him; and, even as I write, two more volumes are about to appear, in which he has like large share. Thus closely is the name of Brewer identified with the progress of the science for nearly half a century—from 1837 at least, to 1884, some four years after his death, which occurred January 23, 1880. He was born in Boston, November 21, 1814.

Baird published little during the Cassinian period, being then intent upon the great work about to appear; but the number of workers in special fields attests the activity of the times. S. W. Woodhouse published his completed observations upon the birds of the Southwest in an illustrated octavo volume. Zadock Thompson's "Natural History of Vermont" (1853) pays attention to the birds of that State. Birds of Wisconsin were catalogued by P. K. Hoy; of Ohio, M. C. Read and Robert Kennicot; of Illinois, by H. Pratten; of Indiana, by R. Haymond; of Massachusetts, by F. W. Putnam; and various other "faunal lists" and local annotations appeared, including President Jefferson's Virginian ornithology, three-quarters of a century out of date. Dr. T. C. Henry and Dr. A. L. Heermann wrote upon birds of the Southwest; Reinhardt continued observations on Greenland birds; Dr. Henry Bryant published some valuable papers. The since very eminent English ornithologist, Dr. P. L. Sclater, appeared during this period in the present connection. The series of Pacific Railroad Reports, which were to culminate, so far as ornithology is concerned, with the famous ninth volume, were in progress; the sixth volume, containing Dr. J. S. Newberrys's valuable and interesting article upon the birds of California and Oregon, was published in 1857. Thus the Cassinian period, besides being marked as already said in its broader features, was notable in its details for the increase in the number of active workers, the extent and variety of their independent observations, and the consequent accumulation of materials ready to be worked into shape and system.

(1858—18—).

The Bairdian Period.—The ninth volume of the Pacific Railroad Reports was an epoch-making work, bearing the same relation to the times that the respective works of Audubon and Wilson had sustained in former years. A great amount of material—not all of which is more than hinted at in in the foregoing paragraph—was at the service of Professor Baird. In the hands of a less methodical, learned, and sagacious naturalist, of one less capable of elaborating and systematizing, the result would probably have been an ordinary official report upon the collections of birds secured during a few years by the naturalists of the several explorations and surveys for a railroad route from the Mississippi Valley to the Pacific Ocean. But having already transformed the eighth volume of the Reports from such a "public document" into a systematic treatise on North American Mammals, the author did the same for the birds of North America, with the co-operation of Cassin and Lawrence. This portly quarto volume, published in 1858, represents the most important and decided single step ever taken in North American ornithology in all that relates to the technicalities of the science. It effected a revolution—one already imminent in consequence of Cassin's studies—in classification and nomenclature, nearly all the names of our birds which had been in use in the Audubonian epoch being changed in accordance with more modern usages in generic and specific determinations. While the work contains no biographical matter—nothing of the life-history of birds, it gives lucid and exact diagnoses of the species and genera known at the time, with copious synonymy and critical commentary. Various new genera are characterized, and many new species are described. The influence of the great work was immediate and widespread, and for many years the list of names of the 738 species contained in the work remained a standard of nomenclature from which few desired or indeed were in position to deviate. The value of the work was further enhanced in 1860 by its republication, identical in the text, but with the addition of an atlas of 100 colored plates. Many of these plates were the same as those which had appeared in other volumes of the Pacific Railroad Reports, notably the sixth and tenth and twelfth (the two latter volumes having appeared in 1859); others were those contained in the "Mexican Boundary Report" which appeared under Professor Baird's editorship in 1859; about half of them were new.

I have spoken of the collaboration of Cassin and Lawrence in the production of this remarkable treatise. Considering it as only one of a series of reports upon the Pacific Railroad Surveys, I should bring into somewhat of association the names of others who contributed the ornithological portions of other volumes, as the fourth, sixth, tenth and twelfth—Dr. C. B. R. Kennedy, Dr. J. S. Newberry, Dr. J. G. Cooper and Dr. George Suckley. Nor should it be forgotton that numberless other collectors and contributors, whose specimens are catalogued throughout the volume, brought their hands to bear upon the erection of this grand monument.

But what of the genius of this work?—for I have not measured my words in speaking of Wilson and Audubon. Can any work be really great without that mysterious quality? Certainly not. This work is instinct with the genius of the times that saw its birth. This work is the spirit of an epoch embodied.

But here I must pause. My little sketch is brought upon the threshold of contemporaneous history—to the beginning of the Bairdian period, of the close of which, as of the duration of the Bairdian epoch, it is not for me to speak. When the splendid achievements of American ornithologists during the past quarter of a century shall be seen in historical perspective; when the brilliant possibilities of our near future shall have become the realizations of a past; when the glowing names that went before shall have fired another generation with a noble zeal, a lofty purpose and a generous emulation—then perhaps, the thread here dropped may be recovered by another hand.

THE SPIKEHORN.

Editor Forest and Stream:

In one of the elaborate and highly interesting papers on "Deer in the Adirondacks," by Dr. Merriam, published in your journal of May 8, the subject of the spikehorn deer is treated at considerable length. In the article in question, a quotation is given from the "Antelope and Deer of America," by Judge Caton, whose truly exhaustive treatise I have read with singular pleasure and profit. I am well aware of Judge Caton's ability to give a sound, scientific and practical opinion upon any point connected with the morphology of the genus *Cervidæ*, and it is with much diffidence that I venture to differ with such a learned and distinguished specialist, in so far as the spikehorn is concerned. Judge Caton holds that the spikehorn is a yearling, or only a youny animal.

In that portion of my paper on the "Deer of the Ottawa Valley," published in FOREST AND STREAM on the 27th of March last, I gave a brief description of the spikehorned deer, as I have found him, seen him, known him and shot him, at various times during the last forty years. The peculiarities of this elegant deviation in that beautiful branch of the deer family, specifically designated *Cervus virginianus*, as given in the article to which I have referred, I believe, and know from the experience of others, and my own experience and research, to be substantially and literally correct. I may repeat, that the spikehorned buck, as we have him here in Canada, is shorter in the legs, rounder and thicker in the body, and has a much more elegantly shaped head than the buck of the generic animal with branching horns. The venison of the spikehorn is much finer and more delicious than the other. The buck of the spikehorned variety—if the term legitimately applies—has usually straight horns, from six inches to a foot long, sharp-pointed and prongless, set backward on a line with the face. Occassionally, however, the horns are found slightly curved inward, in which case they are far less formidable weapons than such as are perfectly straight. The spikehorn grows to fully 200 pounds in weight, as he stands. No Virginian deer of one, two, or three years old attains this weight.

By those well acquainted with this deer, even the doe of the spikehorn class can readily be distinguished by her characteristic peculiarities. The track of this animal can also be distinguished from the track of the branching horn, being somewhat rounder and less pointed.

I do not know how many Virginian deer Judge Caton may have had altogether in his acclimatization grounds; but I believe it quite possible that even among hundreds kept in a state of domestication he may not have had a single specimen of the true spikehorn.

The spikehorn has always been a puzzle to me; nevertheless, there he is. I cannot ignore his existence, notwithstanding the fact that it is almost a species of zoological heresy to question the experimental deductions of such a well-established authority as Judge Caton.

There may be, after all, some grounds for the story of the spikehorns driving the branch-antlered deer out of the Adirondacks. There can be no question whatever as to the fighting capabilities of the former. I believe that the moose, or even the wapiti, would be compelled to fly from his dangerous attack, as the bison has to retreat from the battering charge of the ponderously-horned Rocky Mountain cimmarron, or the domestic bull from the ordinary tame ram.

I have written this letter, not through any feeling of a captious nature or in the spirit of dogmatism. I have been simply endeavoring to prevent my old and beautifully-interesting acquaintance, the spikehorned buck of the Ottawa Valley, from being scientifically exterminated.

WM. P. LETT.

OTTAWA, May 17, 1884.

THE WILLET BREEDING IN DELAWARE BAY.—For the information of "Homo" I would say that on one of my collecting tramps (May 19) I discovered a nest of the willet (*Symphemia semipalmata*) containing three beautiful fresh eggs, and they now form a valuable addition to my collection. This nest was found in the long grass on the marsh, near the Warner house, on the Delaware Bay, and what we Jerseymen call Big Island. The mother bird would not leave her nest until I had my hand almost upon her. This is the first nest of the willet I have ever found, and I have collected in the same locality for several years.—CHAS. E. BELLOWS, PH. G. (Bridgeton, N. J., June 2, 1884).

HEATED SPARROWS.—Hollidaysburg, Pa.,—While standing in the casting house of a blast furnace at this place I witnessed a striking illustration of the well-known pugnacity of the common English sparrow. The two birds engaged in the battle fell from the rafters of the building to the heated surface of a large cake of slag, on which they continued to fight, until a distinct smell of scorching feathers was noticed, when a workman with a broom served them notice to quit.—JUNIATA.

Game Bag and Gun.

EARLY ACCOUNTS OF THE GRIZZLY.

THE exploring expedition of Captains Lewis and Clarke across the western territory of the United States, along the Missouri and Columbia rivers, early in the present century, probably gives the earliest description of the grizzly bear now accessible. Thinking some extracts from their journal may prove interesting to readers of the FOREST AND STREAM, after the lapse of eighty years from the time the incidents occurred, I have compiled the following pertaining to the animal named:

The expedition set out from the mouth of the Wood River, near St. Louis, Mo., May 14, 1804. It consisted of the officers of the United States Army above named, and forty-two men, provided with three boats of twenty-two, seven and six oars respectively, with sails to be used when practicable, and two horses, "to be led along the banks of the river." Those who have seen the Missouri River need not be told that progress up its turbid current, with row or sail boats, was very tedious.

The first mention of the grizzly occurs October 20, when they were just above the mouth of Cannonball River, in speaking of the game observed: "We have seen great numbers of elk, deer, goats and buffalo, and the usual attendants of these last, the wolves, who follow their movements, and feed upon those who die by accident, or who are too poor to keep pace with the herd; we also wounded a white bear, and saw some fresh tracks of those animals, which are twice as large as the track of a man."

No further mention of the grizzly is made that year. Nov. 3, they established winter quarters about midway between the mouth of Cannonball River and that of the Little Missouri River; built cabins protected by a stockade and called it Fort Mandan. More or less of the men were engaged in hunting most of the winter but no mention of bears occurs. April 7, 1805, the expedition resumed its tedious voyage up the Missouri. April 10 they "saw the track of a large white bear." April 13, "two white bears were seen." April 17: "Around us are great quantities of game, such as herds of buffalo, elk, antelope, some deer and wolves, and the tracks of bears." April 27 they passed the mouth of Yellowstone River.

April 29: * * "Capt. Lewis, who was on shore with one hunter, met about 8 o'clock two white bears. Of the strength and ferocity of this animal the Indians had given us dreadful accounts; they never attack him but in parties of six or eight persons, and even then are often defeated, with the loss of one or more of the party. Having no weapons but bows and arrows, and the bad guns with which the traders supply them, they are obliged to approach very near to the bear, and as no wound except through the head or heart is mortal, they frequently fall a sacrifice if they miss their aim. He rather attacks than avoids man; and such is the terror he has inspired that the Indians who go in quest of him paint themselves, and perform all the superstitious rites customary when they make war on a neighboring nation. Hitherto those we had seen did not appear desirous of encountering us; but, although to a skillful rifleman the danger is very much diminished, the white bear is still a terrible animal. On approaching these two, both Capt. Lewis and the hunter fired, and each wounded a bear. One of them made his escape; the other turned upon Capt. Lewis, and pursued him for seventy or eighty yards; but being badly wounded he could not run so fast as to prevent him from reloading his piece, which he again aimed at him, and a third shot from the hunter brought him to the ground. It was a male, not quite full grown, and weighed about three hundred pounds; the legs were somewhat longer than those of the black bear, and the claws and tusks much larger and longer. Its color was a yellowish brown, the eyes small, black and piercing. The front of the fore legs of the animal, near the feet, is usually black, and the fur is finer, thicker and deeper than that of the black bear; added to which, it is a more furious animal, and very remarkable for the wounds which it will bear without dying."

May 6: "Captain Clarke and one of the hunters met this evening the largest brown bear we have seen. As they fired he did not attempt to attack, but fled with a most tremendous roar; and such was his tenacity of life, that although he had five balls passed through his lungs, and five other wounds, he swam more than half across the river to a sandbar, and survived twenty minutes. He weighed between five and six hundred pounds at least and measured eight feet seven inches and a half from the nose to the extremity of the hind feet, five feet ten inches and a half round the breast, three feet eleven inches around the neck, one foot eleven inches round the middle of the foreleg, and his claws, five on each foot, were four inches and three-eighths in length. This animal differs from the common black bear in having his claws much longer and more blunt; his tail shorter; his hair of a reddish or bay brown, longer, finer and more abundant; his liver, lungs and heart much larger even in proportion to his size, the heart particularly, being equal to that of a large ox; and his maw ten times larger. Besides fish and flesh he feeds on roots and every kind of wild fruit."

May 11: * * "About 5 in the afternoon one of our men * * came running to the boats with loud cries and every symptom of terror and distress. For some time after we had taken him on board he was so much out of breath as to be unable to describe the cause of his anxiety; but he at length told us that about a mile and a half below he had shot a brown bear, which immediately turned, and was in close pursuit of him; though, being badly wounded, he could not overtake him. Captain Lewis, with seven men, immediately went in search of him; and having found his track, followed him by the blood for a mile, found him concealed in some thick brushwood and shot him with two balls through the skull. Though somewhat smaller than that killed a few days ago, he was a monstrous animal, and a most terrible enemy. Our man had shot him through the center of the lungs; yet he had pursued him furiously for half a mile, then returned more than twice that distance, and with his paws had prepared himself a bed in the earth two feet deep and five feet long, and was perfectly alive when they found him, which was at least two hours after he received the wound. The wonderful powers of life which these animals possess render them dreadful; their very track in the mud or sand, which we have sometimes found eleven inches long, and seven and a quarter wide, exclusive of the claws, is alarming; and we had rather encounter two Indians than meet a single brown bear. There is no chance of killing them by a single shot unless the ball goes through the brains, and this is very difficult on account of two large muscles which cover the side of the forehead, and the sharp projection of the center of the frontal bone, which is also thick. The fleece and skin of this bear were a heavy burden for two men, and the oil amounted to eight gallons."

May 14: * * "Toward evening the men in the hindmost canoes discovered a large brown bear lying in the open grounds, about three hundred paces from the river. Six of them, all good hunters, immediately went to attack him, and concealing themselves by a small eminence, came unperceived within forty paces of him. Four of the hunters fired, and each lodged a ball in his body, two of them directly through the lungs. The furious animal sprang up and ran open-mouthed upon them. As he came near, the two hunters who had reserved their fire gave him two wounds, one of which, breaking his shoulder, retarded his motion for a moment, but before they could reload he was so near that they were obliged to run to the river, and before they had reached it he had almost overtaken them. Two jumped into the canoe, the other four separated, and concealing themselves in the willows, fired as fast as they could reload. They struck him several times, but instead of weakening the monster, each shot seemed only to direct him toward the hunters, till at last he pursued two of them so closely that they threw aside their guns and pouches and jumped down a perpendicular bank of twenty feet into the river; the bear sprang after them, and was within a few feet of the hindmost, when one of the hunters on shore shot him in the head and finally killed him. They dragged him to the shore and found that eight balls had passed through him in different directions."

May 19: * * "Our game consisted of deer, beaver and elk; we also killed a brown bear, which, although shot through the heart, ran at their usual pace nearly a quarter of a mile before he fell."

May 22: * * "We killed a dear and a bear; we have not seen in this quarter the black bear, common in the United States and on the lower parts of the Missouri, nor have we discerned any of their tracks, which may easily be distinguished by the shortness of its claws from the brown, grizzly or white bear, all of which seem to be of the same family, assuming those colors at different seasons of the year." This is the first reference to the animal under the name grizzly. This was just below the mouth of Judith River.

June 2: * * "The hunters who were out the greater part of the day, brought in six elk, two buffalo, two mule-deer, and a bear. This last animal had nearly cost us the lives of two of our hunters, who were together when he attacked them. One of them narrowly escaped being caught, and the other, after running a considerable distance, concealed himself in some thick bushes, and, while the bear was in quick pursuit of his hiding place, his companion came up, and fortunately shot the animal through the head."

June 14: Captain Lewis, alone at the time, was exploring the country about the falls of the Missouri when "he met a herd of at least a thousand buffalo, and, being desirous of providing for supper, shot one of them. The animal immediately began to bleed, and Captain Lewis, who had forgotten to reload his rifle, was intently watching to see him fall, when he beheld a large brown bear which was stealing on him unperceived, and was already within twenty steps. In the first moment of surprise he lifted his rifle; but remembering instantly that it was not charged, and that he had no time to reload, he felt that there was no safety but in flight. It was in the open, level plain; not a bush nor a tree within three hundred yards; the bank of the river sloping, and not more than three feet high, so that there was no possible mode of concealment. Captain Lewis, therefore, thought of retreating with a quick walk, as far as the bear advanced, toward the nearest tree; but, as soon as he turned, the bear rushed open-mouthed, and at full speed, upon him. Captain Lewis ran about eighty yards; but, finding that the animal gained on him fast, it flashed on his mind that, by getting into the water to such a depth that the bear would be obliged to attack him swimming, there was still some chance for his life; he therefore turned short, plunged into the river about waist deep, and, facing about, presented the point of his spoutoon. The bear arrived at the water's edge within twenty feet of him; but, as soon as he put himself in this posture of defense, he seemed frightened, and, wheeling about, retreated with as much precipitation as he had advanced. Very glad to be released from danger, Captain Lewis returned to the shore, and observed him run with great speed, sometimes looking back, as if he expected to be pursued, till he reached the woods. He could not conceive the cause of the sudden alarm of the bear, but congratulated himself on his escape, when he saw his own track torn to pieces by the furious animal; and he learned from the whole adventure never to suffer his rifle to be for a moment unloaded."

June 25: * * "J. Fields was sent up the Missouri to hunt elk; but he returned about noon and informed us that, a few miles above, he saw two white bears near the river, and, while attempting to fire at them, there came suddenly a third, which, being only a few steps off, immediately attacked him; that, in running to escape from the monster, he leaped down a steep bank of the river, where, falling on a bar of stone, he cut his hand and knee, and bent his gun; but; fortunately for him, the bank concealed him from his antagonist, or he would have been most probably lost."

June 27: The hunting party killed nine elk and three bears. "As they were hunting on the river, they saw a low ground covered with thick bushwood, where, from the tracks along the shore, they thought a bear had probably taken refuge; they therefore landed without making any noise, and climbed a tree about twenty feet above the ground. Having fixed themselves securely, they raised a shout, and a bear instantly rushed toward them. These animals never climb, and, therefore, when he came to the tree and stopped to look at them, Drewyer shot him in the head. He proved to be the largest we had yet seen; his head appeared to be like that of a common ox; his fore feet measured nine inches across, and his hind feet were seven inches wide, and eleven and three quarters long, exclusive of the claws. One of these animals came within thirty yards of the camp last night, and carried off some buffalo meat which we had placed on a pole."

July 3: "Having completed our celestial observations, (this was at the head of the Great Falls of the Missouri) we went over to the large island to make an attack upon its inhabitants, the bears, which have annoyed us very much of late, and were prowling about our camp last night. We found that part of the island frequented by the bear forms an almost impenetrable thicket of the broad-leafed willow; into this we forced our way in parties of three, but could see only one bear, which instantly attacked Drewyer. Fortunately, as he was rushing on, the hunter shot him through the heart within twenty paces, and he fell, which enabled Drewyer to get out of his way; we then followed him one hundred yards and found that the wound had been mortal. Not being able to discover any more of these animals we returned to camp."

July 24: * * "We saw a large bear, but could not come within gunshot of him." Again, under the same date, "On this island we saw a large brown bear, but he retreated to the shore, and ran off before we could approach him. These animals seem more shy than they were below the mountains." The expedition was now in the neighborhood of the Three Forks of the Missouri, and bears are rarely mentioned. They appear to have been very numerous from the mouth of Judith River upward to the head of the Great Falls of the Missouri.

July 25: * * "While crossing the island they killed two brown bears, and saw great numbers of beaver."

On Aug. 26, the expedition passed over the summit of the Rocky Mountains and reached the waters of the Columbia. From here onward game was very scarce and bears are not mentioned at all. Horses, dogs and roots procured from the Indians, became the chief food. Nov. 16 they reached the mouth of the Columbia. A few days later they established winter quarters a few miles south of the Columbia, on the sea coast, naming it Fort Clatsop.

March 23, 1806, the return march was begun, retracing substantially the route pursued in going west the year before. On May 14, when well up toward the head waters of the Columbia, the journal says: "The hunters killed some pheasants, two squirrels and a male and female bear, the first of which was large and fat and of a bay color; the second meager, grizzly, and of a smaller size. They were of the species common to the upper part of the Missouri, and might well be termed the variegated bear, for they are found occasionally of a black, grizzly, brown, or red color. There is every reason to believe that they are of precisely the same species. Those of different colors are sometimes killed together, as in the case of these two, and as we had found the white and bay associated together on the Missouri; some nearly white were seen in this neighborhood by the hunters. Indeed, it is not common to find any two bears of the same color; and if difference of color were allowed to constitute a distinct species, the number would be increased to almost twenty. Soon after they killed a female bear with two cubs. The mother was black, with a considerable intermixture of white hairs, and a white spot on her breast. One of the cubs was jet black, and the other of a light reddish brown or bay color. The fur of these variegated bears is much finer, longer, and more abundant than that of the common black bear; but the most striking difference between them is that the former are larger, have longer tusks, and larger as well as blunter claws; that they prey more on other animals; and that they lie neither so long nor so closely in winter quarters, and never climb a tree, however closely pressed by the hunters. The variegated bear here, though specifically the same with those we met on the Missouri, are by no means so ferocious, probably because the scarcity of game and the habit of living on roots may have weaned them from attacking and devouring animals. Still, however, they are not so passive as the common black bear, which are also found here; for they had fought with our hunters, though with less fury than those on the other side of the mountains."

May 31: "Two men visited the Indian village where they purchased a dressed bear skin of a uniform pale reddish brown color, which the Indians called *yackah*, in contradistinction to *hohhost*, or the white bear. This induced us to inquire more particularly into their opinions as to the several species of bears; and we produced all the skins of that animal which we had purchased. The natives immediately classed the white, the deep and the pale grizzly red, the grizzly dark brown, in short, all those with the extremeties of the hair of a white or frosty color, without regard to the color of the ground of the fur, under the name of *hohhost*. They assured us that they were all of the same species with the white bear; that they associated together, had longer nails than the others, and never climbed trees. On the other hand, the animals with black skins, those which were black with a number of entire white hairs intermixed, or with a white breast, the uniform bay, and the brown and light reddish brown; they ranged under the class *yackah*, and said they resembled each other in being smaller, in having shorter nails than the white bear, in climbing trees, and in being so little vicious that they could be pursued with safety. This distinction of the Indians seemed to be well founded, and we were inclined to believe, first, that the white or grizzly bear of this neighborhood form a distinct species, which, moreover, are the same with those of the same color on the upper part of the Missouri, where the other species is not found. Second, that the black or reddish brown, etc., are a second species, equally distinct from the white bear of this country, and from the black bear on the Atlantic and Pacific oceans, which last two seem to form only one species. The common black bear is indeed unknown in this country; for the bear of which we are speaking, though in most respects similar, differs from it in having much finer, thicker, and longer hair, with a greater proportion of fur mixed with it, and also in having a variety of colors, while the common black bear has no intermixture or change of color, but is of a uniform black."

July 10: The expedition was now again on the head waters of the Missouri, and near the scene of their long delay of the year before at the Great Falls of that river. A party had been sent in advance with the camp and reported at night that "they had been pursued as they came along by a very

large bear, on which they were afraid to fire, lest their horses, being unaccustomed to the report of a gun, might take fright and throw them. This circumstance reminded us of the ferocity of these animals when we were before near this place, and admonished us to be very cautious."

July 15: "During the day we were engaged in drying meat and dressing skins. At night McNeal, who had been sent in the morning to examine the *cache* at the lower end of the portage, returned, but had been prevented from reaching that place by a singular accident. Just as he arrived near Willow Run he approached a thicket of brush in which was a white bear, which he did not discover till he was within ten feet of him; when his horse started, and, wheeling suddenly round, threw him almost immediately under the animal. McNeal started up instantly, and, finding the bear raising himself on his hind feet to attack him, struck him on the head with the butt end of his musket. The blow was so violent that it broke the breech of the musket and knocked the bear to the ground; and, before he recovered, McNeal sprang into a willow tree which he saw close by, and remained there, while the bear closely guarded the foot of it, till late in the afternoon. He then went off, when McNeal came down, and, having found his horse, which had strayed to the distance of two miles, returned to camp. These animals are, indeed, terribly ferocious; and it is matter of wonder, that in all our encounters with them we should have had the good fortune to escape unhurt."

July 16: * * "As we came along we met several white bears, but they did not venture to attack us." From the head waters of the Columbia, Captain Clarke, with a portion of the command, diverged southward, and crossing the head waters of the Missouri, reached the Yellowstone and descended that stream. Under date of July 31, narrating the progress of this division the journal says: "Having made sixty-six miles, they stopped for the night; and just as they landed, perceived a white bear, which was larger than any of the party had before seen, devouring a dead buffalo on a sand bar. Though they fired two balls into him, still he swam to the mainland and walked along the shore. Captain Clarke pursued him, and lodged two more balls in his body; he bled profusely, but still made his escape, as the night prevented them from following him."

Aug. 2: * * "The bear, which had given them so much trouble at the head of the Missouri, they found equally fierce here. [Along the Yellowstone.] One of these animals, which was on a sand bar as the boat passed, raised himself on his hind feet, and after looking at the party for a moment, plunged in and swam toward them; but, after receiving three balls in the body, he turned and made for the shore. Toward evening they saw another enter the water to swim across, when Captain Clarke directed the boat toward the shore, and just as the animal landed shot it in the head. It proved to be the largest female they had seen, and was so old that its tusks were worn quite smooth."

This is the last mention of the grizzly in the journal. The divided party reunited below the junction of the Missouri and Yellowstone and on Sept. 23, 1806, reached St. Louis.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

Your correspondent "Hammerless" in issue of May 15, must have very limited chances of observation or else he has never really tried to find the gun that did not fall short of the target given by the maker. I have never yet tried an American gun that didn't make, with the proper load, as good, if not better target, than that given by the maker. Parker's guns are universally so, by common report among gun dealers and others who handle a great number of them. Remington's and Colt's also usually make a better target than that marked on the tag, if properly loaded. I lay great stress upon the loading, as the pattern depends almost entirely upon that, and it is unreasonable to suppose that any gun will shoot in the same manner, regardless of gauge, length of barrels or choke. I have a 10-30-10 that has made the following targets, off-hand shooting, which is not the best way. Distances were measured: Forty yards, with five drams Eagle duck powder, one ounce No. 8 shot (my measure gives 460 to ounce) 318 pellets in a 24-inch circle, 330 in a 24-inch square. At 50 yards, 244 in a 24-inch circle; using this time 1¼ ounces of shot. I would have tried a 30-inch circle, but could get no paper large enough. These are probably better than a long series of shots would average, but am satisfied that I can very nearly do as well every time. I consider that the secret of all this lies in the loading. I use two pink-edge wads over powder, not quite down, the powder being left rather loose. In this way I can burn 6½ drams in my gun every time and get the full force of the charge. I don't want my powder all crushed to fine dust as I have seen done by forcing the wads down as hard as they can be driven. I have found by experiments, too, that coarse powder is better for pattern than fine, and as for close cover or snap shooting I use Electric, and find about the same pattern at 18 yards as with coarse Eagle Ducking at 40.

Q. U. AIL.

ORLANDO, Fla.

Editor Forest and Stream:

I will have to give it up for the present that fire and gunpowder have some kind of an understanding mutually that under certain peculiar circumstances they lay aside their well-known antipathy to each other and occupy the same space at the same time without the one interfering with the other. "D. W. C.," in issue of May 15, says that this peculiar condition of affairs comes about when a gun is overcharged with coarse powder. "P." says that the same thing happens when the rifle is overcharged with powder. These gentlemen would hardly write so pointedly and positively unless they had carefully experimented and proven their position absolutely. But have they experimented? I am well aware that this inquiry casts a reflection, but the idea is simply so preposterous on its face is my excuse for asking the question. I have experimented in this line carefully, but perhaps crudely. "D. W. C.'s" own words, "a long blaze of burning powder," should set the matter at rest, for how can in any possible way a grain of powder that did not take fire in the gun escape this "long blaze of burning powder?" By what hocus pocus do these two things occupy the same space at the same time and the fire not explode the powder?

I did not say, nor do I pretend to say, that each and every grain of powder is entirely consumed in the gun when it is overcharged and fired. I know that such is not the fact. But I did think I knew that each and every grain "took fire" and began to burn—explode—before it reached the muzzle of the gun, or, at least, before they got out of "the long stream of burning powder beyond the muzzle." I said in this paper, April 24, that gunpowder was a compound substance, made up of three very different things just simply mixed, with the result that no powder has two grains exactly alike (the proofreader in the other article made me say "things" instead of "grains," in that way spoiling my meaning); some of them—the extremes—differing very materially from others. If all the powder grains in a charge had exactly the same and the right proportions of saltpeter, sulphur and charcoal, and these were mixed the same in each, then all would be changed into their gases in the same length of time; but it is impossible to mix these three substances so intimately together in mass, that when the mass is grained into powder all will be the same. Some grains will be nearly pure sulphur, which we all know burns very slowly and does not explode, others will be sulphur and charcoal; they will also burn slowly, etc. These pellets of sulphur and of sulphur and charcoal will be projected from the muzzle of the gun afire, and fall to the ground afire. Here is a sample—the common 22-caliber, rim-fire cartridge, short, containing three grains of very fine and strong powder. I have often seen when firing these from a 30-inch Ballard after dusk, grains fall clear to the ground ablaze. Once I was standing up and firing this rifle over an open dish of powder—about a pound—from which a party were loading shells. The dish was about eight feet in front and six feet below the muzzle of the gun, when one of these sparks of slow-burning compound—we can't call it powder—dropped into the dish and got up a regular "picnic" among some ten or fifteen of the boys, scorching some of them severely. Now, if there ever was a gun overcharged with coarse powder (FG), it was that tin cup. But I think it all burned inside or outside of the cup, at least I do not recollect of an individual grain getting away. Possibly if there had been white paper spread around sufficiently, we might have gathered at least a charge or two.

But why say more on this subject until after careful experiment. Assertions prove nothing. I shall experiment in this line as carefully as possible and if I find that I am wrong I will own up. It may be that nearly all of us have been wrong, been laboring under foolish delusions. For if an overcharge of powder don't all burn, we have been very foolish for thinking that our guns would "kick us heels over head" if we put in ten drams of powder instead of five, for according to this newer philosophy no more than five drams can possibly burn in a ten-bore gun.

BYRNE.

LACON, Ill., May 17.

Editor Forest and Stream:

I have just been testing my pair of wildfowl guns to see what I can get out of them. (Inclosed targets.) These guns are of no use except for wildfowl, as they shoot so close at short distance as to tear quail or young chickens all to pieces. I have just cleaned them up and put away till next November. I consider I am at fault if I do not kill geese or ducks at 80 to 100 yards on the wing. The chances of holding far enough ahead on swift game are great; it takes long practice. It takes me three or four days every season before I get the hang of it. Red River for sixty miles is one vast bed of sand, making the best goose ground I know of this side of the Rockies, and from November till March a sportsman can get his fill of goose shooting. For other shooting I presume that my guns make as poor a pattern as a man could find in a month's ride. I use a plain cylinder for quail and most of the time on turkey. No one could persuade me to use a choke on quail over a dog, or even snipe, yet the mania for close-shooting guns increases. I know hundreds who use 10-pound 10-bore close choke on quail when a 16 or 20-cylinder would be the weapon.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

The articles on "Choice of Hunting Rifles" tell pretty plainly that the majority want a rifle with a bullet heavy enough for good execution and the flattest possible trajectory. In the May 22 number of FOREST AND STREAM the article from "C. D.," which overflows generally with good sound sense, contains one statement which is the object of this letter to disprove, viz.: "The number of repeaters thus far developed that fill the bill can be counted on the thumbs of a one-armed man," and all "because they shoot with too high a trajectory, throw too much lead with too little powder." Not knowing what repeater is to be counted on that thumb, it is supposed to be the one that shoots the least lead with the most powder. Now let us see. It is the old, old story of condemning a good rifle on account of its ammunition or lack of ingenuity in preparing it. "C. D." points it out all through his article, but at last does the very thing himself. He says: "There are times when a man has nothing else to do, and he may very pleasantly and profitably inspect his ammunition. If he reloads it himself, then the reloading, if properly done, is an inspection." With the above I decidedly agree. I think I have loaded every shell I have used hunting for four years, and in doing so I keep in view a flat trajectory. I put in all of my .45-75 Winchester shells 90 grains of powder and 300-grain bullet hardened 1 to 11; but what I prefer to do is to buy new cartridges, draw out the bullet and put in 20 grains of Hazard No. 3 ducking powder, and then seat the 300-grain bullet aforesaid.

I do not know just the trajectory at 200 yards, but venture the assertion that it will compare favorably with any other. Another thumb, please.

I can take any empty government shell and load it with 90 grains powder and the 300-grain Winchester bullet; but, better still, take out the bullet from a new cartridge and put in 85 grains of powder above named, or some equally as good, and seat the bullet. This I have repeatedly done and work them perfectly through the magazine. The recoil is not as much as before changing, and they are perfectly safe in any rifles that will take the United States government shell, which are several. So several more thumbs are required. The last-described ammunition I used hunting deer with a Marlin rifle in Northern Minnesota three years ago. I do not know that the new .45-85-285 cartridges, so favorably spoken of and used and advertised by the Marlin Arms Company, was the result of my experience, but it tickles my vanity to know I led off "in that direction." Two years ago, while hunting in Montana in company with a friend who had a .45-60 Winchester, I had two rifles, the .45-75 Winchester, with modified ammunition, as before described, and a Hotchkiss, with 90-300 (government shell). After shooting over a deer's back at 100 yards and under his belly at 200 yards until he got tired of it, I persuaded him to try my Winchester and I would use the Hotchkiss. At the end of one day he was so pleased with the result that he wrapped his rifle up in a gum blanket and hid it in the sage brush and used mine the remainder of the hunt.

I wrote the Winchester Arms Company two years ago about loading 1,000 cartridges to order for me containing 90-300. They answered they would, but cash must accompany the order as the goods would be worthless for any one else, evidently thinking the inquiry came from a crank. Now, I certainly predict that in less than three years just such cartridges will be on sale everywhere, the same as the .45-85-285 are now (which, by the way, is nothing but the government shell with modified charge, and not a special rifle, as a great many think), and such cartridges will not "be worthless for any one else."

In all my use of a Winchester I never got "balked," except where it was clearly my own fault by reloading my shells so many times that they were swelled and would not enter the chamber or would not extract after firing. The .45-90 I prefer to the .40-90, for the reason that when an animal is shot clean through, the .45 hole is the most deadly, one of your correspondents to the contrary notwithstanding. As for comparison of the recoils, trajectories, etc., I know nothing, never having seen a .40 90, but the recoil of the .45 90-300 is not so unpleasant as the .45-75-350 with the same weight of powder and lead as the express Winchester .50-caliber. Is not the .45-caliber entitled to the name "express?" I think so.

C. M. SKINNER.

MINNEAPOLIS, Minn.

PHILADELPHIA NOTES.

PERSONS living in the section of Pennsylvania lately visited by forest fires state that damage has been done to the ruffed grouse of that section. One farmer, who resides about ten miles from the Lehigh River, told your correspondent he had found two or three nests of scorched and deserted eggs, and from all I could learn during a trip to the Lehigh Valley (from which I have just returned), the prospects of good pheasant shooting in that region for the coming autumn is very poor. Deer have been coming to neighborhoods from which it was thought they had long since been driven. The same gentleman informed me that several had been frequenting his rye field within the past two weeks, and that he had on more than one occasion seen them. This is within ten miles of a town of at least fifteen hundred inhabitants.

Mr. Harry Parker's estate is now offering for sale a number of semi-domesticated deer, which have been for a few years running at large within the inclosed park this gentleman took so much pride in at Mauch Chunk, Pa. The Bloomingdale Park Association should secure these specimens, as they are fine ones.

The stay of the bay birds on our near New Jersey shores was a brief one. Many were killed during their short sojourn. The professional market gunners at the different sea side resorts have now put away their guns and are getting their yachts and sailboats in trim for the summer season, and their attention will mostly be given to "waiting upon the boarders" unless the demand for gulls and water birds for hat ornamentation should offer a more lucrative occupation. If the rage is to continue another year, millinery establishments will send to New Jersey coast, as they did last season, taxidermists who will remain at the different hotels the whole summer and purchase everything in the shape of feathers, from a strand snipe to a blackheaded gull, and better wages can be earned by the baymen than sailing sea-side visitors at $3 or $4 per day. It is hoped the fashion spent itself last year, and the gulls and beach birds may be spared to ornament the sea side and not the hats of the city belles.

HOMO.

MAY 31.

THE COST OF GUNS.

Editor Forest and Stream:

"Wells's" article on "English and American Guns," reminds me of a conversation I had some years since with my late colleague on the New Hampshire Fish Commission, Mr. A. H. Powers, of Grantham, N. H.

Mr. P. had for some time the superintendence of the forging department for the Providence Tool Company, at the time they were deeply engaged in the manufacture of military rifles for foreign governments, and he informed me that the cost of gun barrels was a mere trifle compared to the common opinion of their expense, and that the material, forging, rough boring and turning, all of which can be done by machinery, would amount to but a very few dollars for a pair of first-class barrels. Of course a large amount of hand-labor can be put on them afterward to get a high finish, and if all the work was done by hand it would be still more expensive, but still, he told me a pair of barrels does not cost anything like as much as they are supposed to.

"Wells" is right also about the cost of locks. It is the fashion among the old school gunsmiths to decry "machine-made" guns, but as a practical mechanic, I beg to say that no hand-work can equal the precision of a machine. Witness the military rifles and revolvers, all made by machinery of American invention, to say nothing of the sewing machine, machine tools, agricultural implements, etc., into the cost of which hand-labor scarcely enters, and at best forms but an insignificant item.

SAM'L WEBBER.

SHOOTING NEAR NEW YORK.—I have never seen so many partridges and quail as at Nyack. I lived near center of village. Last November in one day I put up five bevies of quail and sixteen partridges within two miles of my house. They are all to be found along the ridge which runs from Oak Hill Cemetery north to Hook Mountain—partridges on top of ridge on Maxwell farm and north of it, and quail on eastern slope of ridge. We will have fine quail shooting here this fall. I hear them whistling in every direction. There are three broods on our place alone. East of Cresskill station, on the Alpine road, is the best woodcock ground I have ever seen. My dog found four nests in one place there this spring, and he is a youngster, never been trained at that. He did not flush the old birds, just pointed, and I am told it was a beautiful sight. I think this will do for so near the city.—N.

MASSACHUSETTS.—Salem, Mass., May 30.—I was at Ipswich Beach the 22d. There were a good many "peeps," and I also saw eighteen beetleheads (*S. helvitica*) and fourteen of the greater yellowlegs. I also saw a least bittern that had been shot and thrown away by some one, and as it was "ripe" when I found it, I much regretted the loss. Woodcock are hatching, and some quail are heard whistling. I don't think hawks have been as numerous this season as usual. The season thus far has been wet, and if it continues it will have a tendency to help fall gunning. Of course, now things are between "hay and grass" so far as shooting goes. —X. Y. Z.

MANITOBA GAME LAW.—Several changes have been made in the game laws. The various close seasons during which game and fur-bearing animals must not be shot at, hunted, trapped, taken, killed or had in possession within the Province of Manitoba are as follows: All kinds of deer, including cabri, or antelope, elk or wapiti, moose, reindeer or caribou, or the fawns of such animals, from Jan. 1 to Oct. 1. The following varieties of grouse, commonly known as prairie chickens or pheasants, and partridges, from Jan. 1 to Sept. 1. Woodcock, plover, snipe, and sandpipers, from Jan. 1 to Aug. 1. All kinds of wild duck, sea duck, pigeon, teal, wild swan, or wild goose, except the variety of wild goose commonly known as the snow goose or the wavy, from May 1 to Aug. 15 Otter, fisher or pekan, beaver, muskrat and sable, from May 15 to Oct 1. Mink and marten from Oct. 15 to Nov. 1. Any such animal or bird may be had in possession for the private use of the owner and his family at any time, but in all cases the proof of the time of killing, taking, purchasing or purpose for which had in possession shall be upon the person so in possession. This provision merely applies to animals or birds killed during the open season, and kept over until the close season, and does not permit any of the animals or birds above mentioned to be killed or taken during the periods in which they are protected. No eggs of any of the birds above mentioned shall be at any time disturbed or had in possession. None of the animals or birds above mentioned shall be exported from Manitoba at any time whatever. Any person violating any of the provisions of the game laws is liable to a fine of $50 and costs for each offense, with imprisonment in default of payment. The Department of Agriculture has already appointed about two hundred game guardians in different portions of the Province. This number will be increased as rapidly as possible. In order to enforce the law in the city of Winnipeg, which heretofore appears to have been the principal place in which violations occurred, owing to dealers purchasing and selling during the close season, a sum has been placed in the estimates to provide for the payment of expenses which may be incurred in prosecuting offenders, and securing their conviction and punishment.—H. A. P.

GAME IN THE SOUTHWEST.—Fort Bowie, Arizona Territory.—In Arizona and New Mexico the deer are growing so scarce that it is almost impossible to see one. You may travel for days and never see any, where a few years ago you could sit in your cabin doors and shoot them at any time. It is almost impossible to see an antelope at all, and they are growing more scarce every day. At the rate they are disappearing inside of five years there will be no such animal in the Southwest. There are more white-tail deers in the country than of black-tail, for the former are so wild that the hunter and trapper cannot get near them. The black-tail deer is almost as scarce as the antelope. Wild pigeons, ducks, partridges, prairie chickens and wild turkeys are found in abundance, but the reason for this is that there are very few shotguns in the country, and the hunters prefer large game to fowl. Of course, there are laws for the purpose of prohibiting the killing of game in certain parts of the year, but they are not enforced. About the only place large game can be found at the present day is away up on the mountains and along the Mexican line. As soon as large game disappears, the country will be flooded with shotguns and the small game will disappear. Even now shotguns are becoming very plentiful.—OLD TIMER.

FISHING AND SHOOTING RESORTS.—The Erie Railway (J. N. Abbott, General Passenger Agent, New York) and the New York, Ontario & Western Railway (J. C. Anderson, General Passenger Agent, New York) have published guide books to summer resorts reached by their lines. For sportsmen's aid they give particulars like these: "Rutherford, N. J., fine fishing in the Passaic; woodcock and snipe shooting near Passaic, N. J., fine fishing on river; Lake View, N. J., good fishing at Dundee Lake; Hohokus, N. J., woodcock, quail and pickerel, very good lake fishing; Suffern, N. Y., bass and pickerel fishing, partridge, quail and woodcock; Ramapo, N. Y., good fishing and gunning; Sloatsburgh, N. Y., a paradise for sportsmen, bass and pickerel fishing, good hunting, partridge, woodcock and quail; Lorillard's, N. Y., black bass, pickerel and perch, privilege of fishing, liberal price per rod per day, boat included; Southfield, N. Y., partridge, quail, rabbits, duck and woodcock, good fishing in lakes near by; Turner's, N. Y., a retreat for sportsmen, partridge, quail, woodcock, bass, pickerel, perch; Monroe, N. Y., black bass, pickerel, perch, woodcock, quail, rabbits." And so on through the catalogue.

LET THE TRAPPERS BE HEARD.—*Editor Forest and Stream:* I notice a letter in your last number signed "Tillicum," from Olympia, W. T., regarding liability of present style of Newhouse steel trap to throw out the foot of the animal, and asking for an improvement. In my opinion a steel trap should always be set lengthways in the path for beaver and otter, and by so doing they will not set their foot on the catch that holds the jaw down, but will set their foot fair on the pan, and as the trap is sprung their foot will not be lifted up by the jaw of the trap. I think myself some improvement might be made by having the jaws wider and higher, retaining the same size of spring, and I think, too, that an entirely different style of catch to hold the jaw might be advantageously substituted. It is to be regretted that trappers as a class are not much given to writing. Your readers miss much valuable and interesting matter thereby. For the experience of many a remote trapper, if written in a plain, undemonstrative manner, would add very much to the pleasure so many brethren of the craft derive from your good paper.—J. LEE SMEDLEY (Dugdale, Pa.).

SNIPE FLYING FROM THE WATER.—Glendale, O.—In reading Forester's "Field Sports" revised ed. p. 164), I see he notices the fact that snipe swim across narrow streams, etc., and wonders whether they could take wing from the surface of water. He doubts it. A recent experience of my own may therefore be of interest. While shooting one day this spring, I marked down an English snipe on the edge of a large open pond. Upon walking it up, it flew out directly over the water, and fell to my second barrel. I had no dog with me, and so after replacing my shells and preparing myself to wade, all of which time the snipe lay in the water, I started out after it. I had gone perhaps fifteen yards, and the water was already above my knees, when the bird rose clear of the water into the air and flew about a hundred yards and dropped again. By wading again I secured it, and proved it to be beyond a doubt a snipe. There was no grass nor weeds in the water from which it could have sprung. Of this I am positive. Is not this an unusual feat for a *Scolopax wilsoni*?—T. P.

PATERSON, N. J., has a new ordinance which forbids the capture or sale of trapped nighthawk, whippoorwill, sparrow, thrush, meadow lark, skylark, finch, martin, swallow, woodpecker, robin, oriole, red or cardinal bird, cedar bird, tanager, catbird, bluebird, snowbird, or other insecticerous bird. It also forbids nest robbing. This is a wholesome law. Hundreds of song birds have been killed daily in Paterson, a city covering a large amount of territory, but the efforts of the officers of the Passaic Association under the ordinance has put a stop to this. The State law is worthless, as it permits killing of birds for stuffing.

OFF THE CHESAPEAKE BAY—May 26.—The shooting this spring is very fine. The curlew are unusually plentiful, the willets very scarce. Calico backs and graybacks are in profusion. A trio of us killed, one evening off Cape Charles bar, fifty-two curlew. The robin snipe have just made their appearance, and a very late one. The prospect for summer shooting, judging from the number of sportsmen here this spring, will not be very good, as a large flight of spring baybirds generally is followed by a small flight in summer, and *vice versa*.—CHASSEUR.

PENNSYLVANIA PROSPECTS.—Hollidaysburgh, May 27.—Prospect for summer shooting is fair. Black bass and catty fishing is already begun, with satisfactory results.—JUNIATA.

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—IV.

WE roused Merrill out and were on the way to the lake before sun-up, through green fresh woods, vocal with bird melody and redolent with all the sweet smells of an early morning in the pines and cedars.

Three quarters of a mile over a rough road, part of which was swampy, brought us to the lake, where four boats, pulled up on the shore, awaited our use, and Merrill pointed out the location of the camping place he had selected for us, a couple of miles below, which, he said, could be reached with the wagons by driving along a narrow strip of sandy beach which lined the shore down this side as far as we could see.

We did not expect to fish any that day, and started with only two of the boats; Frank, Old Dan and the Deacon in one boat and neighbor Merrill and I in another, the others preferring to stay with the wagons. Before we had gone a hundred rods a shout from Frank's boat ahead proclaimed that something had happened, and looking in their direction we saw the Deacon, who had before leaving home concealed a trolling line and spoon somewhere about his person, hold up a shining small-mouthed black bass that, when weighed, pulled down the scale to nearly four pounds. This was a symptom, a very large-sized symptom, of good things to come, and then we all shouted and felt better than we did the night just passed. But we had our opinion of the Deacon for snaking in that first bass on us in such a surreptitious manner, and with a hand line, too. Shade of gentle Thad Norris! A solemn conference was held that night around the flickering camp-fire and the Deacon was voted a pot-fisher of the deepest dye, and fit only to rank with a man who will fish for black bass with worms.

In crossing the mouth of a little creek (Rocky Creek) near where the bass was taken, one of the horses attached to the spring wagon took it into his cranky old head to mire in the soft sand and fall down. The driver and the boys in the wagon jumped out and into the water; a couple of feet deep, and yanked him to his feet before any damage was done, and putting their strength to the hind wheels, quickly had all safe on the beach across the creek with no more serious consequences than a partial wetting and a slight scare; thus pulling out of a "category" that might have been a calamity had the horse drowned. A few hundred yards further down the wagons came to a halt where a couple of trees had fallen across the strip of beach, and as they could not drive around them through the wood nor around the tops lying in the water, we were forced to unload and take to the boats. The other two were brought down and all four were loaded and started to camp, the drivers stopping long enough to feed the horses before starting back, but declining our invitation to go to camp and take breakfast.

Two trips of the boats heavily loaded took the traps to the camping place, and after a hurried breakfast, of which the Deacon's bass formed a toothsome part, we decided that this place Merrill had selected was just no camp at all, and we would hunt for a better one.

He had hacked out with his axe a small square in a dense cedar swamp within a few feet of the water, which was barely large enough for a good sized tent, to say nothing of four, and a kitchen fly, and the ground was lumpy, damp and spongy; in short a spot that Dick said would be "very dilatorious to our health."

The only redeeming feature was a little stream running into the lake at one side of this opening; but even this was a small inducement to stay, as the water in it tasted flat and swampy.

The place would not do, and, taking a boat, Merrill, Jim and I started down the shore to look at a spot about a mile below, that M. said was dry, grassy, free of underbrush, and "big enough to hold fifty tents, or a hundred of 'em if we had 'em;" a place he would have picked on in the first place only the drinking water was not handy, he thought. Arriving at the spot a hasty glance satisfied us, and, leaving Jim to cut tent poles—we had brought the axe with us, thanks to the Scribe's usual forethought—Merrill and I went back, and the work of moving began again.

Two hours of hard work completed this last move, and as old Ben lent a hand to get the last box out of the last boat he was moved to warble a line from an old song, slightly altered to fit the occasion, "Sich a gittin' to a camp I never did see"—agreed to on the spot without a dissenting voice.

In two or three hours more the four tents were up in good shape, a fly stretched for the dining-room, stove put up, and supper and dinner at once under way, and we began to feel at home and well pleased with our surroundings. A nice level, dry place, five or six feet above the lake level, plenty of grass for a carpet, no underbrush, trees enough for shade, abundance of firewood along the beach, and a cold spring branch within fifteen or twenty rods of the "kitchen door"—what more could heart of camper-out hanker after? A few rods back of us a strip of cedar swamp ran along the foot of the low hill, and from the brow of this, stretching away toward Little Black River, was another vast tract of plains—and huckleberries.

A hundred yards below us stood an old roofless loggers' camp, back a short distance from the water, which may serve as a land mark for any wandering brother who may some time want to find about the best camping ground on Black Lake.

After supper was over and pipes lighted for a resting smoke, neighbor Merrill gave us a taste of his quality as a talker "of many parts." He was wound up to the last notch, and as this was no doubt the first opportunity presented for some time to unburden himself, "he jest turned himself loose," as Ben said afterward, "and let the old machine buzz till it run down."

He said the plains back of us were a great resort for the black bear during huckleberry time; in fact they were regular "summer resorters," and as this fruit was just now in its prime, we were liable to see a bear most any day that we would take the trouble to go a half mile from camp in the burnt district.

And then he told us how, a few days before our arrival, one of his boys and one of the Stewart boys had been out on the plains, not far from our camp, bringing in a pair of stray oxen, and how they came suddenly on a monstrous bear eating berries by the roadside, and how one of the boys put a load of birdshot into him at short range and the bear got away, and how in the evening he and the boys and the dogs had picked up the trail and run him half the night, finally losing him in a cedar swamp not far from his house, after he had "jest licked the daylights out o' all the dogs."

Without giving us time to catch a breath after this story, he gave the crank another turn and proceeded to dilate at length on Turk's merits as a bear dog, and dog for the "general run of all kinds o' varmints." Turk was a splendid specimen of Scotch terrier, very large for this breed, sinewy and wiry looking as a wildcat, and possessed of rare dog sense and intelligence. He sat on his haunches near his master's knee with eyes half closed, as though he had heard this story before, and as the narration of his many exploits was volubly rehearsed and his name occasionally mentioned, he would look up at the old man with one eye shut and the other half open, as much as to say, "Draw it mild, old pard—a leetle milder, ef you please."

After giving us a long history of Turk, he called him and said, "Turk, show the boys that scar."

We could see an old scar that began near the top of the head and extended down back of the left ear under the jaw, which had healed so well that it was barely noticeable unless closely observed.

"Bear done that," said Merrill. "One night a bear came a smellin' around the house—spect after a deer I'd killed an' hung up that day, and you bet Turk jest went for him. If there's anything Turk likes to fight it's a bear, and as I was a sayin' he went fur that bear like a house afire, and the way they kicked up the sand around them was a caution. 'Twas after night, and before I could git up and git my gun they had fit across the clearin' into the bushes, and sich a yelpin' an' snarlin' an' thrashin' around in the brush you never heard. Before I could git to 'em the bear had laid Turk out an' got away, an' when I got the poor feller back to the house he was the wust used up dog you ever see, but gentlemen, he never whined, no, siree, he was too gritty for that. One leg was bad hurt an' he was all over blood, an' one side of his head was jest cuffed loose—that's the scar—but he never whimpered. I patched him up an' nussed him for three weeks before he could git his jaw in workin' order agin, but he's all right now, an' would tackle a bear jest as quick as he would a mink; fact is, he 'pears to hev a grudge agin bears ever since, an' I b'lieve he would swim the lake any day if he thought there was a bear on t'other side waitin' for a fight. Why, I've bin offered twenty dollars for that dog, but money won't buy him, no, sir, he'd be war up to old Merrill's if I'd sell Turk, for if you b'lieve me, boys, the young uns and my wife thinks more o' that dog than they do o' me." All this was rattled off in about the words I have written, as near as I can now recall them, and as he "run down," he broke into a quiet chuckle that could have been heard half a mile, Turk, meanwhile, snapping aimlessly at an imaginary fly and dozing through it all with the air of a martyr.

Here the Scribe in the goodness of his heart offered the old man "a drap to moisten his thrapple" after all this expenditure of wind, but to his utter amazement he declined with the terse statement, "I never drink liker," which scored a point in his favor with at least one of his auditors. The sun was now down, and straightening up from the campstool he said, "Well, boys, I must be goin' back; I'll take one o' the boats an' bring that lumber down in the mornin' to make your table."

"Speakin' o' bears," as he dipped a cup of water out of the bucket, "there's one thing about bears that mebbe you don't know. Sometimes they come smellin' 'round a man's camp in the night, an' sometimes they git into mischef, break up things an' carry off any kind o' loose vittels layin' 'round, but you needn't be scared of 'em to-night; there's one thing about bears, they never come botherin' 'round a man's camp the first night, it's most allays the second night, or mebbe the third or fourth night, an' if they don't come then, they ain't a goin' to come at all, but they won't come to-night, they allays come the second night, you can bet on that," and with this comforting assurance he shoved off in his boat and went up the lake singing, "Come all ye galyant sailyers," or some such ancient ditty, in a camp kettle tone of voice that I confidently believe could have been heard clear across the lake, a distance of six miles.

Turk was indeed a splendid dog, the finest Scotch terrier I think I ever saw, and without a doubt deserved all the praise his master bestowed on him. He was a hard dog to get acquainted with, but as he got the hang of the camp, kind treatment got the better of his surliness and Turk took his place as a favorite, his bright eye and the wag of his stump tail always insuring him a welcome from the boys.

Old Ben sat for some time holding his campstool down, one leg over the other, looking up the lake at Merrill's receding boat, something evidently on his mind, and as he got up and knocked the ashes out of his pipe he said in his deliberate way, "Boys, it's a heap o' comfort to know them bears ain't a comin' 'round to-night; it's mighty good in 'em to give us a rest the first night, for we're too tired to entertain 'em." Here a few whiffs to start a fresh pipe. "To-morrow we'll hev the camp all fixed up slicker'n grease, an' ef they drap in on us in the evenin', we'll git up a reception fur 'em. Receptions is one of my best holts." A few vigorous puffs to keep the pipe from going out seemed to develop a new idea, and he went on. "But maybe they'll come 'round to-morrow night, an' maybe they won't. Old Merrill 'pears to hev 'em down fine, been studyin' their points some, it's likely, but you kin just put up your last nickel that he kin smell a camp further'n a bear kin, an' mind ye he'll be here oftener'n the bears will."

Dick thought "if Merrill's predilections about the bears were likely to come to pass, we had better hunt another camp, as they were a little too adjacent for him, but he could bear it if the rest could."

Old Knots said if trouble was "bruin" it behooved him to meet it with spirit, and by certain sounds (with which we were somewhat familiar) coming from his tent a minute or two later,. we knew he and the Deacon were "meeting it." The talk was mostly "bear," till old Dan growled something about this bear joke being worn about threadbare, which checked the unexampled display of smartness and turned our attention to getting things in shape for a full night's needed sleep and rest.

If there is a place, to use Ben's favorite expression, "on the face o' this livin' earth" where one can enjoy sweet and refreshing sleep, it is in these wilds of Northern Michigan after a hard day's work getting into and fixing up a camp. Happily the mosquitoes and "no see 'ems," like Merrill's bears, were second night varmints and our first night in the brush was one of solid comfort. We were under shelter none too soon, as rain began to fall some time during the night, and continued nearly all of next day, which had a rather depressing effect on the camp; but we put in the forenoon in stretching a fly for Frank to cook under, putting the two stoves in place, overhauling tackle, smoking, cracking dismal jokes, wishing it would stop raining and blessing Merrill for not bringing the lumber for the table.

A rainy day in camp; drizzle and drip. The patter of rain on a well-pitched tent is always musical; sweeter and more soothing perhaps after a week's pleasant angling, but when it comes on a first day in camp, before you have wet a line, when all is eagerness and expectancy and every fiber in you is crying out to "go out and fish," the melody loses a trifle in sweetness, and the accompaniments jar and grumble and seem all out of tune.

Recollections of that afternoon are rather dim, but I recall the fact that the fever so possessed some of us that we went a-fishing—and I believe there were only two of the party so badly affected—old Dan and the writer. We made ourselves believe we were ravenously "fish hungry," and this was excuse enough for going out in the rain to procure this one necessity to the peace and well-being of the camp—fish for supper.

We had little time to hunt up the good feeding grounds or study the water, as the pattering rain so disturbed the surface of the lake that we could not get a good view of the bottom and surroundings along shore, nor tell where the water looked "fishy," but before time for supper we had taken enough pickerel to keep the camp "sortin' bones" for a week.

No bass, however, were taken, although the most tempting of speckled frogs and a trolling spoon were held out as special inducements to provoke a difficulty.

Back again in camp we found neighbor Merrill had not come with the lumber, and Ben accounted for it by saying, "Guess he's been hidin' round in the woods to-day notifyin' them bears that they'd better be a little peart or they'd make him out a liar, fur you know this is the night they was to git in their work on us."

But neither Merrill nor the bears disturbed the quiet of our slumbers that night, although I am not quite sure his confident air about the promised visit had nothing to do with the excuses made for overhauling the firearms belonging to the party, for I confess to slipping a cartridge in a .44-caliber Wesson rifle and placing it in easy reach, and Dick and Ben under the thin subterfuge of getting a shot at a duck a half mile down the beach loaded their shotguns heavily with buck, instead of duck shot, as it transpired next morning when one challenged the other to a trial of skill at a mark.

[TO BE CONTINUED.]

TROUT AND WATER SNAKES.

WE used to think that the water snakes could not catch a trout, but knew that they could take bullheads. We have seen them often as they worked and strained to get the horns down their throats, and this even when these projected nearly an inch on each side of their jaws. And they always succeeded. But as for catching a trout, this we considered was beyond them. May be we thought they would not dare to pursue such a kingly fish. But they will, and will capture them, too.

It is several years since we had an opportunity of witnessing how this was done. We will give it as we saw it, though since that time we have seen more than one trout disappearing between a snake's jaws, and found many a scarred one where, no doubt, they had escaped the almost fatal "strike" of the water snake. But the period in question was one pleasant morning in June. We were on a walk, and crossing a stone bridge, that extends north and south over a spring stream. A stream, we might remark, too, that was once quite celebrated for its trout fishing. Just above the bridge was a small pond, about fifty feet long and twenty wide, with a depth of six feet in the deepest part near the bridge, while it shallowed away to eighteen inches at its upper end. The pond was in the very position for observing what took place in its depths. This bridge was fifteen feet above it, and the nine o'clock sun lighted up its waters, so that when the wind did not blow, everything was almost as transparent beneath the surface as in the air above. This morning it was especially clear, and one standing on the bridge could see every old tomato can, fragment of china, iron hoop, and white pebble that lay scattered along the bottom. For the pond was quite near the owner's residence, and not far from a village.

In this place were some fifteen or twenty trout, and they frequented this deep hole near the bridge. It was only necessary for one standing on the bridge to look over the low stone parapet that guarded it, and he would see the fish hurrying and scurrying, either to the upper end of the pond or under an old log that lay close to the abutments of the bridge. Among those fond of looking at the fish was the writer, perhaps sometimes with longing eyes. But we liked to put our head suddenly over the parapet and see the fish pass out of sight, almost as a shadow, and then return, if no movement was made, after a few minutes.

This morning, as we have said, the pond was especially still and transparent, and everything almost as clear as in daylight, and as usual when we looked over, away went the trout. Only they were congregated, we noticed, not in the place where they generally lay, but some six or eight feet to the right of it. But what is that swimming or crawling in the mud there? Is it an eel? No, it has no fins; then its tail is different, and the body is too slim in proportion to its length. Then that eye and head are not those of an eel; and see, its skin is mottled, which even appears through the mud and sediment in which it seems to be burying its body. It is a large water snake. Let us watch; yes, let us watch. Here come the trout back. How carefully they come, as though they were suspicious of something besides the eyes looking at them over the parapet. Now they are going right up to that old piece of stick; and there lies the snake close alongside of it, and I declare he has either changed his color or covered his scales with mud. It must be mud, for there is a little patch, like an oozy bed, near him. But now look out. Here come the fish. Snap! snap! he strikes at them. My! no toad's tongue ever went swifter than that snake's head. He must have caught one. No, he did not. And there he strikes again at that little fellow. We cannot stand this. We raise our hands and the fish hurry away. But see the snake. He seems to be burying himself in the mire and sediment again, while we run to the entrance of the bridge and bring a stone as large as we can carry, and toss it over the place where he hides. When the ripples have subsided the stone is where we meant it should go, but whether the snake was under it we never learned. Most likely not.

Our next experience with water snakes was nearly half a mile further up this same brook. This time we were trying, in July, to get a few fish for a sick girl in the neighborhood. We knew a 'good hole" by a stump where there were some low willow bushes to screen the fisherman. Before we got to the place though, we saw through an opening in the banks that the water was quite agitated and at times the head of a trout or something would appear. They are having a good time jumping there, thought we, and we will get some. Hurry, now! But let us look at this "coachman" though, before we cast. All right! Go carefully, and throw back-handed. Now, ready? No, stop! What is that? Why see that trout! What in the world does he keep his head above the water for? It must be he is sick and trying to get under. I declare he is coming this way, too. I wish he would keep still. What does make him bob so? And a "ten-incher," too. Oh, I see! An immense water snake has him in his mouth, and he is to trying to drown him. He has caught him just above the tail. I cannot stand this. I will kill that snake. Give me a stick. That fish would weigh three-quarters of a pound nearly. Here! Slap! whack! The trout is gone, and here comes the nasty snake straight for my legs and I cannot pull this foot out. It is caught between the rocks and I will go over directly. Get out you beast. I don't want you to wind around my legs Ah! It is the large rock that my right foot is resting on that you want, is it? You are hurt a little, too, and mean to hide. I am glad. And now I will have another peg at you I can see half your body. You are only a foot under water and I will drop this rock on you. That is good, you will catch no more trout.

This snake was a yard or more in length, and the next time we visited the stream, his body, nearly twice its natural size, was lodged against a stone a few rods below the place where we killed him. We congratulated ourselves when we saw it that he did not get a chance to wind around our legs and that the lives of many trout had most likely been saved.

But since that time, as we have said, we have seen several snakes with trout between their jaws. They succeed best in capturing them in August, when the streams are low, and in small brooks where the trout have little chance to escape. They pursue them over and under everything and it is hard to tell the injury they do, especially when the water is shallow.

A. H. G.

PENNSYLVANIA ANGLING NOTES.

IT did not surprise me at all to learn while on a late trip to the Lehigh Valley that large trout in some numbers have been taken in waters which it was thought had long since been depleted of fish. One stream in particular which to me always looked very "trouty," and which I was always told contained only chub, was fished by an intimate friend on being informed by less expert anglers than himself that large fish kept stripping off their flies and breaking their leaders, and to his astonishment, trout of good dimensions were basketed.

There are many large streams in Pennsylvania flowing into the Lehigh which have been given up as troutless by the native anglers simply because the fish do not respond to their bungling efforts to catch them, when there are many favorable days during the season, when an expert fly-fisherman can take a fair number, at least enough educated ones, to furnish good sport. We know how long the Sauken Creek at Hellertown, Pa., gave sport to a few scientific fly-fishermen, when to even the natives of its banks it was thought the trout had years ago disappeared from its waters. Because the country beanpole and horse hair line and worm bait cannot at once yank trout from a stream, it is no reason the waters do not harbor the fish and cannot be taken by the angler who imitates nature and is cautious.

HOMO.

Mr. A. M. Spangler, of the Anglers' Association of Eastern Pennsylvania, has been telling a Philadelphia *Times* reporter about the fishing in the neighborhood of Philadelphia. He says:

Bass can be caught in the Schuylkill all the way to Royer's ford, but at Reading and below that point they are poisoned by the sewage. They can be caught in the Delaware and its tributaries, from Trenton to the headwaters. There are not many bass found in the Lehigh. The Susquehanna, at a number of accessible points, has, within a few years, become noted for the excellence of its bass fishing. Both the striped and black bass are caught. Beginning at Port Deposit, striped bass are taken weighing as high as fifty pounds and black bass range in weight from two to seven pounds.

The bait used varies according to circumstances, as the black bass will sometimes take a fly readily and then again he won't. Crawfish and minnows are often used and the ugly black worms called helgramites are good. The best bait are small fish brought from Baltimore called "mud dabbers." At Port Deposit one can get boats and men to go with you for very moderate sums. June and July are the best months, but there is no restriction under the laws of Maryland, and you may fish the year round without molestation. Above Port Deposit there are many good fishing points, of which Conowingo Bridge, Bald Friar, Peach Bottom, White Eddy and Safe Harbor occur to me now. Further up are Columbia, Marietta and many other excellent spots all the way to Harrisburg and up the east and west branches of the Susquehanna. The Juniata is full of black bass, and they are good-sized ones, too. Bass are the gamiest fish caught, and when a ten-pound, striped fellow gets hold of your hook it doesn't take you long to find it out.

Below Havre de Grace, at the mouth of the Susquehanna, fine sunfish or moccasin are caught with a fly. They are also taken in the Northeast River in the channel at some stages of the tide and at Spesutia Island, further down the bay. Perch fishing is especially fine at the mouth of the Sassafras River. To get there you take the Philadelphia, Wilmington, and Baltimore Road to Clayton and go by way of Still Pond to Betterton. The perch there vary greatly in size, the heaviest weighing a pound and a half. Perch can be caught along the Delaware on the bars, but they are rather small. Early in the season good-sized ones can be caught up the stream in the shallows. Timber Creek and Newton Creek, near Gloucester, are good perch fishing grounds, if one knows his business. The piers at Chester, Marcus Hook and at the mouth of Christiana Creek are famous places to catch catfish, rock and perch. Pennsboro, on the other side of the bay, is equally good. Sturgeon and shad roe are the best bait. Further down the bay, say seventy-five miles, to Sea Breeze, reached by the steamer John A. Warner, you can go off in a boat to Ship John Light and catch your boat full, if the day is right. And close by is Fortescue Beach, famous for fishing and mosquitoes. All the way down the bay, where there are shell beds, you can find good weakfishing, especially at Fishing Creek, eight miles north of Cape May light. Big drumfish are caught here. Matt Quay, you know, devotes much of his time to these fellows. But for real sport go to the Breakwater and you can catch blackfish, weakfish and sheepsheads in any quantity.

Outside on the Jersey coast are the bluefish, now gradually disappearing, and immense weakfish and croakers. It is a curious fact that thirty years ago the croakers were to be found in great numbers, but the bluefish drove them out and destroyed them. Now the bluefish are going and the croakers are coming back. The best time to catch these fish is from the middle of August until quite late in the season I have caught a barrel of weakfish a day. All the sounds and inlets from Cape May to Barnegat are alive with weakfish, kingfish, and sheepshead. Off Townsend's Inlet last season the blue sharks were very troublesome. They would bite off our fish just about as fast as we hooked them. I believe more fish can be caught along the Jersey coast than any other waters in the United States. The good fishing points are Rio Grande, Townsend's Inlet, Somers Point and Beasley's Point. Then if you take the Long Branch road to Barnegat there are Long Beach, Short Beach, Barnegat Inlet, Tom's River and Weirtown, all good resorts for fishermen. But the finest fishing here for seabass and blackfish is found outside, especially off Long Branch. The fisherman launch their boats through the surf early in the morning and on a reef a mile or so off they catch enough for use in the hotels.

Trout fishing is very nearly at an end in this State. In the northern counties patient anglers manage to catch a few small ones now and then, but to do very much trout fishing one must go outside of Pennsylvania.

BLACK BASS IN TENNESSEE.

Editor Forest and Stream:

If you will kindly suggest in your paper, or by private letter to me, how black bass can be shipped, and the proper size, etc, I can make arrangements with fishermen on Reelfoot Lake to supply the United States, if necessary to do so. I have lately talked with some leading fishermen, and in answer to some of my questions they inform me that they can supply them in any quantity and of any size on short notice. This town is only three hours' drive to the lake and to the rapid Reelfoot Bayou, and is from one to eight miles of the Obion, the Forked Deer and South Fork rivers, all of which are abundant of bass, white perch, channel cat, salmon trout, pike, etc., etc. I saw even in last February 600 pounds of bass and perch in one wagon, selling at six cents a pound. If any of your readers want good summer fishing, let them come to this place, via C. O. & S. W. R. R., and go to the lakes or basins, formed by the earthquakes of 1811, and they will find good fishing, good spring water, fine camp ground, fine scenery, clever people, and can have a good time.

I own no land, except my home, and have no nets, no seines, nor any axe to grind; but enjoy rod and minnow fishing, and like for my friends to enjoy it with me. I would take pleasure in answering a limited number of letters, where stamps are sent for reply. I have nothing to sell, but will do my best to give any information in my power about fish and fishing in West Tennessee.

T. L. WELLS.

DYERSBURG, Tenn., May 19.

RED SPOTS ON SALMON.

Editor Forest and Stream:

I notice in this week's number of FOREST AND STREAM, a paragraph headed "What Fish is This?" In your answer you state that "salmon and landlocked salmon are black spotted and have neither red spots nor splashes."

Permit me to correct you. The young fry or parr of both salmon and landlocked salmon have the same red spots as the brook trout, during the first year of their existence. They do not put on the black and silver livery until the end of the second summer, so far as my experience goes.

They have, as your correspondent says, sharper noses and forked tails, and are very active, and rise to the fly readily.

We have taken numbers of them in that way, experimentally, in the Penigewasset River, near the Massachusetts and New Hampshire hatching house, and know that hundreds of them were so taken and called trout by the boys, until the difference was explained to them.

I do not recognize the "red splashes," but the red spots of the young salmon in their "parr" state are even more brilliant than those of the trout, and they are only to be distinguished from trout at a casual glance by the forked tail, and more general sharpness and slenderness of outline.

They have also the same dark cross bands, like those of the common perch, which mark the brook trout in their first year. I should be much inclined to think the fish spoken of were young salmon.

I have just got Messrs. Orvis & Cheney's new book—"Fishing with the Fly"—and must beg leave to say a word in praise of its beauty. The plates of flies are exquisite, and worth more than the price of the book, and the letter press is equally good. The selections are capital, and the new matter by Messrs. Orvis & Cheney equally good, and Mr. Orvis's "Suggestions" eminently practical, as much so as Ness muk's "Woodcraft." Can I say more?

SAM'L WEBBER.

LAWRENCE, Mass.

ARRIVAL OF SALMON.—The first salmon from the Restigouche arrived in New York on Friday last. A few from the Miramichi are also coming. The fish look bright and are bringing fair prices These rivers are the only ones on the Atlantic coast that have yet sent salmon to market this season.

ROD AND REEL ASSOCIATION.

FOR the coming Tournament of the Association, to take place on October 7 and 8, President Endicott has appointed the following Committee of Arrangements:

Hon. Henry P. McGown, Cuttyhunk Club, Chairman; James Benkard, South Side Club of Long Island; E. G. Blackford, New York Fish Commission; S. M. Blatchford, Squibnocket Club; Dr. E. Bradley, Blooming Grove Park Association; Martin B. Brown, Wa-Wa-Yanda Club; D. W. Cross, President Oneida Club; Francis Endicott, President (*ex-officio*); C. B. Evarts, American Fishcultural Association; Hon. James Geddes, Onondaga Fishing Club; William C. Harris, St Lawrence Fishing Club; Dr. J. A. Henshall, Cynthiana, Ky.; Dr. C. J. Kenworthy ("Al Fresco"), Jacksonville, Fla.; William Blair Lord, Oquassoc Club; Thatcher Magoun, Jr., Massachusetts Game Protective Society; C. H. Mallory, Ichthyophagous Club; Prof. A. M. Mayer, Stevens Technological Institute; J. C. McAndrew, Restigouche Club; Hon. R. B. Roosevelt, New York Fish Commission; Isaac Townsend, West Island Club; James L. Vallotton, Pasque Island Club; J. S. Van Cleef, Willowemoc Club; C. Van Brunt, Willowemoc Club; Edward Weston, Greenwood Lake Association; Locke W. Winchester, Restigouche Club; Louis B. Wright, Westminster Kennel Club; Rev. H. L. Ziegenfuss, Christ Church, Poughkeepsie, N. Y.

FRED MATHER, Secretary.

GREENWOOD LAKE.—The fun has begun. The black bass season in New York and New Jersey opened June 1. The season for nabbing poachers opened some days before that date. The Passaic County Fish and Game Protective Association sent a posse of officers to the lake. They had warrants for the arrest of several notorious violators of the law; but these persons had taken fright, and one of them had left the country for good and is not expected to return. In fact, although the neighborhood of the lake was thoroughly searched, none of those for whose arrests warrants had been issued could be found. The lake was examined for setlines, but the lines which were in the lake last week had been removed. The weirs or traps for catching fish were the next attended to. A man named Jacob Ryerson had a weir in the outlet of the lake and he was notified at once to destroy it or be placed under arrest and taken to Paterson. He agreed to comply with the request. Mr. Keenan then proceeded to a large weir run across the Wynockie River, immediately below the outlet from the lake. This weir belongs to a Swede, who was not to be found, having apparently made himself scarce on hearing of the approach of the officers. The fish warden proceeded at once to destroy the weir. This weir consisted of two wings of stone walls built in the Wynockie River, and joined together by a large trap in the middle of the river. In this way every fish which left Greenwood Lake was captured except the very smallest. Mr. Keenan had come prepared and he and his assistants waded into the stream, reached the trap and made kindling wood out of it, which was allowed to float down the stream. There was no opposition whatever to this work of the fish warden's. The party then returned to Ryerson's weir. It was found that Ryerson had taken an axe and had apparently destroyed the trap. Investigation showed that only a foot below the surface of the water had been removed and that the "basket" at the bottom still remained intact. In this way some of the fish might escape, but the larger ones and the larger portion of the smaller ones would still be caught. Ryerson was informed that this would not do, and that he would at once be arrested and taken to Paterson if he did not make a good job of the work of destruction. He needed no further urging and destroyed, in view of the party, the whole trap. The association proposes to keep a close watch on these traps and other contrivances about the lake, but from present appearances the violators of the law have been thoroughly impressed that the association means business and intends to see that the law in relation to fish and game is enforced.

AMATEUR ROD MAKING.—I wish to thank Mr. Wells for the information that his interesting articles in late numbers of the FOREST AND STREAM has conveyed, and by which I have been benefited. I am an amateur rodmaker myself and make all my own fly-rods, and have made quite a number for friends about here. I have just been fastening the ferrules on a rod with guttapercha gum as he recommended, and believe it will hold them in place much better than any thing heretofore found. This has always troubled me in the past more than anything else in making rods. For the benefit of amateur rodmakers, let me say that T. H. Chubb, whose advertisement is in the FOREST AND STREAM, will supply them with rod material and trimmings of the best quality at prices about one-fourth of what most other dealers in such articles charge. And those ordering by mail sending money in advance, will get just as good an article as they would were they there to pick it out for themselves. This is more than can be said of some dealers. Some time ago, I ordered from a certain dealer by mail, some lance and bethabara wood, and I found when I received it that a stick of each kind of wood had a knot near the middle of each the full size of the sticks, one being ¾ and the other ½ inch square. The lance stick was marked on the knot with a cross X, and the word "cull" was written with pencil on one side. I paid the price of the wood in advance, besides paying postage and registering fee, and the wood was perfectly useless to me. I claim that doing business in this way is downright robbery and nothing else, and that a dealer who serves a customer so after receiving his money in advance and knows they cannot help themselves, is actually a robber. But those who do business in this manner are sure to lose more than they make in the end, for no one will long deal with any one who serves them in such a manner.—ADIRON ONDACK.

SALMON.—Mr. S. J. Martin reports to the U.S. Fish Commission that a salmon weighing 21½ pounds was taken in a trap net at Kettle Island, on the Massachusetts coast, just south of Gloucester, on the 21st of May. The Bangor, Me., *Commercial* says: "The king of all the salmon is on exhibition at A. E. Jones's market on Kenduskeag Bridge. The label attached to the fish says it was caught by R. French, Sandy point; the weight is forty-six pounds. Not even the oldest inhabitants can remember of so large a salmon being caught in the Penobscot. The salmon fishing at Grand Lake stream is reported to be good."

TROUT NEAR NEW YORK.—Sing Sing, N. Y., June 2.—The hills hereabout afford most excellent trouting. My friend Mr. H. W. Ambler, of this place, a most devoted Waltonian, made a creel of twenty good brook trout, the largest of which measured 14 inches.—CANONICUS.

TROUT AND BASS NEAR NEW YORK.—If you can coax big trout, and are not afraid of water and mud, take the Northern Railroad of New Jersey, to Cresskill. Just west of the station you will find a good sized creek, keep on the east bank and fish north for four miles. I have heard of several two-pounders being taken from this stream this season and know personally that there are large fish in it. One gentleman had 1,500 large trout weighing from one to three pounds washed out of his ponds into the creek the past spring, and one of the best natural streams in the State empties into it just north of Cresskill. I have never noticed you mention Rockland Lake in your paper. During the past year some fine catches of black bass and pickerel were taken there, one bass of eight pounds. The East Reef opposite old ice house at the southern end of the lake, is best for early morning, and West Reef, directly opposite, for afternoon for bass, and crawfish is the only bait for them, though they will sometimes take the fly. The northwest shore, just on the edge of the lily pads, abounds with pickerel from one to seven pounds, also yellow bass of large size. I have had fine sport on this water; it is easy of access, and a few days' fishing costs but little. Take Northern Railroad of New Jersey to Nyack, four miles to lake, and either hire conveyance or do as I do, foot it. There is another place quite near by which I have not seen you mention. The Hudson River from Luzerne, on Adirondack Railroad, to Corinth, seven miles of as fine black bass fishing as one can wish for. Minnows or small suckers are the bait. On the west bank a number of fine trout streams come in. My cousin and friend took two hundred good sized trout from these streams one day last week, none of the fish were trout hog size either, and all were eaten. We get a fish in the Hackensack above Oradel called "wind fish," from the fact that they are taken most readily when the wind blows. In shape it resembles the trout, also in gaminess, takes the fly readily and is a good table fish. The back is dark olive, sides dull gold, belly white, fins underneath edged with red, weigh from eight ounces to two pounds. Can you tell from this poor description what they are?—N.

TAKING BIG TROUT.—Hallock, Minn., May 28.—*Editor Forest and Stream:* The fishing for the "whoppers," described by "Homo," in the issue of May 15, with minnows for bait, is legitimate and justifiable. These big fellows are gourmands, feeding on young trout from choice. Their appetite is insatiable and demand a constant feeding to keep up their appearance. We consider a flight similar to those invented by Mr. A. N. Cheney, and used by him for lakers with a minnow for a bait, will kill them every time. We have pursued just this course when fishing for *Salmo fario*, and without any lashing of conscience. These big trout are cannibals in every sense of the word, growing ugly in appearance as they grow older. They should be exterminated by all fair and honorable means. Our system is to make a flight of three hooks, using one for a lip hook, on this I put my minnow for bait and then spin this across the hole. If "Homo" wants to kill these big fellows let him cut out the ventral fin of one of the small brook trout, put it on the lip hook, and if he spins it carefully he can readily kill the monsters.—NORMAN.

TROUT IN CHENANGO COUNTY, N. Y.—Smithville Flats, N. Y., June 2.—I reply to the inquiry of "Niagara," in FOREST AND STREAM of May 29, relative to trout in Chenango county. There are very few trout left in any of our public waters; however, some very fair catches were reported in April. As a general thing there are two fishermen for every three trout. What is known as the Wheeler Brook, about a mile and a half below Greene, contains nearly all the trout in the immediate vicinity of the town. "Niagara" could find good bass fishing in the river and excellent pickerel fishing in most any of the numerous natural ponds or lakes of Greene or Smithville.—E. L. R.

BOOTLESS BUSINESS.—Grand Rapids, Mich., May 27.—You will see by the inclosed clipping that we are doing something all the time to protect for the legitimate use of the people the public property represented by our wild game animals. Yet it is a bootless business, to expend personal time, money, and mental and physical labor for the protection of public property in the hope of getting a fair share of the benefits of such expenditure, and then to see that property gobbled up by lawless poachers is getting monotonous.—E. S. HOLMES. [The slip reports that one James M. Bryant of Grand Rapids had been arrested and fined for taking trout of less than the lawful size.]

LITTLE AND BIG.—The Manton, Mich., *Tribune* of recent date reports: "Some very fine specimens of the trout specie are being taken from Cedar Creek this season. A Sherman man caught 88 trout one day last week, and rumor says he carried the entire lot home in a four-quart pail. Last Wednesday, A. Newkirk succeeded in bringing in a trout which turned the scale at three pounds and two ounces."

RAINBOW TROUT IN GREENWOOD LAKE.—Mr. W. H. Schiper brought to our office last Monday a specimen of the California rainbow trout (*Salmo iridea*), which he caught while fly-fishing for bass near the west shore of Greenwood Lake. Several thousand fry were put into the lake three years ago, and this is the first that has been heard of them since. The fish would weigh about four ounces.

Fishculture.

COLUMBIA RIVER SALMON HATCHING.*

BY LIVINGSTON STONE.

[Read before the American Fishcultural Association.]

EVERY ONE has heard of the immense quantities of salmon that are annually canned on the Columbia River. It is not necessary to go into details. The general facts known to all prove that an enormous number of salmon have been accustomed to ascend the Columbia River every year and it is probably safe to say that the Columbia has been the most productive salmon river in the world.

This is one side of the subject. The other side is this: Such enormous quantities of salmon taken from a river must ultimately endanger the productiveness of it. The situation is not, however, quite as bad as it looks, for it seems at first sight as if the stock of a salmon river would be diminished in proportion to the number of salmon taken out of it, but this is not wholly true, for a compensating element of great weight comes in to disturb the calculation. Nature, perhaps more aptly speaking, providence, in the case of fish, as well as with numberless other creatures, produces great quantities of seed that nature does not utilize or need. It looks like a vast store that has been provided for nature to hold in reserve against the time when the increased population of the earth should need it and the sagacity of man should utilize it. At all events nature has never utilized this reserve, and man finds it already here to meet his wants.

If this were not so, if there were no reserved stock of seed provided beyond what nature uses every year, or to apply the hypothesis to the subject before us, if the salmon produced no more eggs every year than what are needed to keep the places of the parent fish filled, then it would be time that a river's stock of salmon would diminish just in proportion to the number of salmon or salmon eggs taken out of it. As it is, the parent salmon in a state of nature probably produce three thousand times as many eggs as would be needed if all became full-grown reproductive fish. The calculation is a very simple one. For instance, the quantity of salmon in any specified river, before they were molested at all by man, unquestionably remained constant from year to year. Making allowance, of course, for exceptional years, the average of any one decade has been, without doubt, about the same as that of the previous or next succeeding decade. It follows, of course, that every pair of full-grown fish have produced during their lives just two, or their own number of full-grown fish of the next generation in order to keep the whole river supply good from year to year.

If they produced more uniformly, the salmon in the river would increase till the river would ultimately become full of fish; if less, the stock for the reverse reason would be ultimately exhausted.

Now, as one pair of salmon produces yearly, say six thousand eggs, it follows that there are deposited each year three thousand times as many eggs as would be needed, supposing that every egg became a full-grown, reproducing parent. I should add that this computation is based on the supposition that all the parent salmon die after spawning and never reproduce again. This is true of the bulk of the Pacific coast salmon. If any do live to get back to the ocean after spawning and reproduce again, it increases the ratio of the number of eggs deposited to the number of salmon that reach maturity.

The value to food-requiring man, of this reserve seed stock, becomes particularly apparent when we consider the effect of the fishing of a salmon river. The first thousand fish taken out of the river, though it deprives the river of three million eggs, makes no perceptible difference with the future supply, because there are so many eggs left that this abstracted quantity, great as it is, absolutely is relatively insignificant, the number of eggs left being so vastly greater.

The first hundred thousand salmon taken from the river makes no difference, partly because there are so many eggs left and partly because one of nature's compensations comes in by making the struggle for existence among the diminished number so much easier that the eggs that are left go as far toward replenishing the river's stock as the larger number did under the less favorable conditions of a comparatively over-crowded river.

So great is the reserve stock of seed originally provided, and so effective are the compensations of nature, that even the first million of parent salmon taken from a great river like the Columbia seems to make no difference in the annual run of salmon up the river.

We might go further, perhaps, and say that the first two million would make no difference, but we need not take the trouble to prove this, for it would not help to illustrate the point if we did; the point being that if the annual catch goes on increasing, the limit will ultimately be reached when the number of eggs in the fish that are left will not be enough, even with the help of nature's compensating agencies, to keep up the river's stock.

I need hardly remind a body of fishculturists and Commissioners that when this limit is passed, the decrease of the fish proceeds at a rapidly accelerated rate. It is burning the candle at both ends, for while the diminished stock of the river keeps diminishing from an inadequate supply of seed, the destructive capacity of the engines of capture are constantly increased to offset the poorer fishing that results.

Then begins a geometrical ratio of yearly decrease which is startling, and of which the end is complete extinction.

Some intelligent people thought that the limit just mentioned had nearly been reached in the Columbia several years ago. Many more persons think it has now. Still, the resources of the great Columbia are so wonderful that, although upward of two thousand million eggs are annually abstracted from the river, there seems to be a doubt remaining yet whether the eggs that are left are not sufficient to keep up the stock.

However, if the fish-eating world does not go backward, the danger limit will soon be passed, if it has not been already, and it is none too soon to consider the question of taking measures to guard against the danger by artificial propagation.

What has been done in the Sacramento in this direction is well known. I take the liberty to quote from an article bearing on the subject, by Mr. C. A. Smiley, of the United States Census Bureau:

Mr. Smiley, after mentioning some of the difficulties of fishculture, says:

"I will close with citing one of the most remarkable of the successes thus far attained. The salmon canneries of the Sacramento River annually increased in number until by 1870 the entire run of salmon was being caught and utilized. The greatest natural capacity of the river under these circumstances may be considered to have been reached in 1875, when the yield to the canneries was 5,096,781 pounds.

The first possible fruits of fishculture were in 1876, when the young of 1873 may be supposed to have returned.

The United States hatchery was established in the latter year at Baird, Shasta county, California, and a half a million young released in 1873 and again in 1874.

In 1875 the number was increased to 850,000, in 1876 to 1,500,000, and during each of the years 1878, 1879, 1880, 1881, two million young fry were placed in this river. From an annual catch of 5,000,000 pounds the river has come up to the annual catch of over 9,500,000 pounds, which figure has been maintained during the past four years.

The figures were:

	Pounds.
1880	10,837,000
1881	9,600,000
1882	9,605,000
1883	9,580,000

Allowing the three years which it takes for salmon to come to maturity and enter the river for spawning purposes, the increase in yield to the canneries for ten years has been almost exactly proportionate to the increase in the disposition of fry. Taking into consideration the cost of hatching 2,000,000 salmon annually, and the value of the increase of 4,500,000 pounds, it will be seen," Mr. Smiley concludes, "that there is a very large per cent. of profit in artificial fishculture, when conducted under circumstances as favorable as these."

What man has done man may do, and what has been done in the Sacramento can be duplicated in the Columbia, and in as much larger proportion as the Columbia is larger than the Sacramento.

An effort was made in 1877 to hatch salmon on the Clackamus River, a tributary of the Columbia.

This location seemed to combine every advantage for the hatching of salmon on a large scale. The river heads, as you are aware, in the perennial snows of Mt. Hood, and the coldness of its snow-fed waters is very attractive to the ascending salmon. Just above its mouth, on the Wilhamette, into which it empties, are the impassable falls of Oregon City, which pre-

*The salmon referred to in this paper is the *Oncorhynchus choutka*, the spring salmon of the Columbia, the chinook salmon, quinnat salmon, the common salmon of the Sacramento River.

vent the salmon from going up the Wilhamette any further, and naturally turns them back into the Clackamus, if they missed that river in the first place. Then, if necessary, the Clackamus can be so obstructed that every salmon coming up can be stopped in front of the fishery. The river is a favorite resort of the salmon, as it must necessarily be, with its cold, clear, and swift running water and, before canning on the Columbia began, the Clackamus was famous for its hundreds of thousands of magnificent spring salmon that used to swarm up its channel to spawn.

But the establishment of the station came too late. Already—this was in 1877—there were fifteen or twenty canneries on the Columbia below the mouth of the Wilhamette, and with their thousand miles or nearly of drift nets waylaying the ascending fish, the main river became so depleted of parent salmon that those that reached the Clackamus in 1877 were but a sorry fragment of the immense shoals that originally came up the stream to spawn.

It was too late. Had the station been established twelve years before, twenty million eggs of the best variety of salmon in the Columbia River could have been taken there every year. The time has gone by now for that, and only a few million eggs can be taken in a season on the Clackamus, until some legislation allows a larger proportion of the parent salmon to reach the river.

This station was partly destroyed by a hurricane a few years ago, and has been abandoned for the present.

Unfortunately the same objection which applies to the Clackamus River as a hatching station for producing young salmon on a large scale, viz., the enormous yearly catch of salmon on the Columbia below the Clackamus, also applies to all other good locations in the Columbia River basin, or rather what were originally good locations. Twenty years ago there were scores of places on the affluents of the Columbia where ten to twenty million salmon eggs could have been obtained annually, because such an enormous quantity of salmon ran up the Columbia that they swarmed in thousands into each of these spawning streams to deposit their eggs.

Now that every season as the salmon come up to spawn, hundreds of thousands of them, I might almost say millions, are caught for canning, there are not enough left to distribute themselves in very great numbers in each of their thousand spawning beds up the river, and it will never again, in my opinion, be very easy to find more than one or two places in the Columbia River basin, where twenty million salmon eggs can be annually obtained unless some legislation protects the salmon on their upward journey, or artificial hatching, simultaneously carried on at various independent localities, increases the number of salmon in the river.

I have made three explorations of the Columbia River for the purpose of finding a good place for getting salmon eggs on a large scale, the last time under the direction of the United States Commissioner of Fisheries, following the Columbia, except around the Great Bend, all the way from the Rocky Mountain divide, where you can step across it (here called Deer Lodge River), to the bar at its mouth where it is fifteen miles across, and I am convinced that the salmon do not now come up to any one of their famous original spawning grounds in such quantities as to make it an easy thing to get twenty or even ten million eggs a year from any of them.

I must except some places (notably the foot of Shoshone Falls in Idaho) on the tributaries of the Snake River, now difficult of access, where it is possible perhaps, if the attempt is made soon enough, to obtain sufficient spawners for large operations in hatching. I will also except the mouth of the Little Spokane River in Washington Territory, where there is a most excellent location for a hatching station, and where perhaps ten million eggs a year could be collected, if the statements made about the number of salmon that come up the river are at all true. These statements have not been substantiated yet for want of opportunity, and all we can say is that thousands and thousands of breeding salmon used to frequent this natural and favorite spawning ground, and perhaps the canners leave enough now in the Columbia to still make the Little Spokane a good collecting place for their eggs. As my report to Prof. Baird recommends this point as a favorable location for a hatching station, a description of some of its advantages may not be out of place here, and the first I will mention is its accessibility. Eight miles from the mouth of the river, over a remarbably hard and level road, is the town of Spokane Falls, a new, but thriving and promising settlement of perhaps 3,000 inhabitants. This town is situated on the line of the Northern Pacific Railroad, and is in daily communication with the rest of the world by mail, telegraph and railroad, the railroad being one of the great trans-continental thoroughfares of the country.

These general facts alone are sufficient to show the accessibility of the location without the necessity of mentioning details.

The water suppiy at the mouth of the Little Spokane for hatching the eggs is practically unlimited. As there is a strong current in the river, and as the water does not rise till after the spawning season and hatching season are over, the water can be safely raised from the river itself by a current wheel, as at the McCloud River Station, and this being the case, any required quantity of water can be brought to the hatching house at a small expense. The location is also favorable for obtaining water conveniently. The river does not ever rise more than a few feet, and consequently the hatching house can be erected not very far above the low water mark. A small current wheel will, therefore, be sufficient to raise the water to the hatching house, and the adjacent land is so favorable for building on that the wheel can be placed very near the hatching house, which will render unnecessary the construction of a long flume from the wheel to the hatching house. As the river does not rise till the hatching season is over, the wheel need not be protected from drift wood, nor arranged with reference to the rising and falling of the water.

These are great conveniences, and on the whole it may be said that the water supply may be safely depended upon in every respect. The location is also remarkably favorable as to availability. Fortunately the adjacent country is still in its primitive state. When I visited the place in July, 1883, many Indians were encamped on the river bottoms, but I saw no white men. It is true some claims near the river have been taken up by white men, but they are not valuable and and could be bought without much expense. It is therefore very probable that the site of a salmon building station could be obtained without much cost, and as there are very few settlers up the river and no towns or villages, no objection would probably be raised to collecting the parent salmon during spawning season by means of a dam across the river.

The Little Spokane is also of such a character that it would be an easy matter to capture the breeding fish. Indeed, I think a seining ground could be arranged so that nearly all the spawning fish that come up to the river could be caught, and furthermore, it being close to the main Spokane River it would not be difficult to run two seining grounds, one on each side, which would undoubtedly somewhat increase the yearly catch of breeders.

It would be a very easy matter to build a dam or salmon rack across the river to keep the breeders on or near the seining ground. Indeed the frail structure that we saw the Indians successfully erecting across the river shows how easy it would be for white men, with their superior appliances, to put a salmon rack across the river, such as would be required to answer the purpose of a breeding station. There being no drought or freshet on the river during the season's operations at the station, and, indeed, no material change at all in the river, a very simple and readily-constructed dam would be perfectly safe. This is a great advantage, as it often proves a very difficult matter in a river subject to freshets in the hatching season to put in an obstruction that is perfectly safe.

And last, but not least, the maximum rise of the river during the year is so inconsiderable, that there will never be any danger of the hatching house and other buildings being washed away, even if they are placed, as it is desirable that they should be, close to the river.

Besides possessing the essential qualification just enumerated for a salmon breeding station, the Spokane location has many convenient features about it to recommend it. In the first place, it is in a good timber country, where lumber can be easily and inexpensively obtained for building. Then the roads in all directions are hard and good, even during the rainy season, which is a merit which can be fully appreciated only by those who have lived in other parts of the Pacific coast, where the roads become practically impassable during the rainy season on account of the great depth of the mud. The ground is also almost level from the mouth of the Little Spokane to the town of Spokane Falls, which would make communication with the town and freighting to and from the breeding station very easy. The climate is also a great recommendation to this place. It is never very cold nor very hot, but the temperature is quite even, and consequently very favorable for work of any kind.

By glancing over what has just been said about the mouth of the Little Spokane, it will be seen that it is known to be in all essential points an unusually favorable location for a salmon breeding station. If it should prove to be capable of furnishing an abundance of breeders, I should not hesitate to recommend it emphatically as one of the best situations to be found anywhere for taking and distributing salmon eggs. If, however, it should fail to supply the required quantity of spawning salmon, I do not know where we could look for any one place on the Columbia River or its north fork which, by itself, would be adequate and satisfactory, and I think we should be reduced to the necessity of going further from the railroad, or erecting two or three separate stations at different points.

Before closing, allow me to mention a fact which may possibly be as much of a surprise to many of you as it was to me. It is that there are no salmon in the whole of that portion of the North or Clark's Fork of the Columbia, which flows through Western Montana and Idaho, including that magnificent body of water, Lake Pend d'Oreille in Northern Idaho.

This fork of the Columbia, known as it flows westward under the various names of Deer Lodge River, Hellgate River and Missoula River, has a length of about three hundred miles before it reaches the Falls of Senniacwateen, just below the outlet of Lake Pend d'Oreille, where it is believed the ascending salmon are finally stopped from going any further, and in the long stretch of river above this point clear to the Rocky Mountains no salmon whatever are found. I was not aware of this fact, and when we had crossed the Continental divide, which was accomplished then in a wretched mud wagon (called by courtesy a stage), and had descended the western slope of the Rocky Mountain range far enough for the Deer Lodge Brook to have become a respectable river, I expected to find salmon very abundant, but to my great surprise the people there were as unfamiliar with salmon in their natural haunts as the people of this city are, and were nearly as far from them.

I found that there were three principal obstructions which kept the salmon from ascending the river. The first one from the ocean is Kettle Falls, in Washington Territory, on the main Columbia, 711 miles from its mouth. These falls are about twenty-five feet in height at low water, but they are not wholly impassable, for on the east side they are broken into a series of cascades, through which the salmon can and do get above the falls at certain stages of the water and possibly at all times.

Forty-two miles above Kettle Falls, the Pend d'Oreille River (Clark's Fork of the Columbia from Lake Pend d'Oreille to the main river is called Pend d'Oreille River) empties into the main Columbia. Near its mouth, at a distance variously stated from a few rods to twenty miles, is another fall, which is undoubtedly a serious obstruction to the salmon. This fall (it being on the Great Bend, I did not see it myself) is said to be ten or fifteen feet in height.

I heard of salmon being caught all the way up to the falls of the Senniacwateen, so the salmon are obviously not all stopped at the falls of the Pend d'Oreille, though probably not a very large proportion get by them.

About one hundred and fifty miles above these nearly impassable falls and not far below the outlet of Pend d'Oreille Lake are the falls of the Senniacwateen, which, though not over eight or ten feet in height, probably head off the comparatively few salmon that reach them and mark the highest point, the *ultima thule* of the upward migration of the salmon of Clark's Fork of the Columbia. I mention these facts, partly because when I was in Idaho and Montana, there was a strong feeling among some of the residents on Clark's Fork in favor of opening a way for the ascending salmon through the obstructions just mentioned, and allowing them to come up into Idaho and Montana, which they would undoubtedly do if they could, although it is nearly twelve hundred miles from the mouth of the Columbia to Deer Lodge City.

I will merely add in this connection that a movement has been started for obtaining the intervention of the Territories interested, and if possible of the United States, for the purpose of opening a passage for the salmon through the formidable obstructions at the mouth of the Pend d'Oreille River, but in my opinion these falls will be found to lie in British territory, and the undertaking mentioned will require the co-operation also of the Dominion government.

I need hardly say in conclusion that in my judgment the sooner we get about this work of hatching salmon on the Columbia the better. We have waited too long already. The great opportunities of twenty years ago are all gone, and every year makes the matter worse.

Mills are going up, settlements are forming, railroads are being built in this trans-Rocky Mountain region with surprising rapidity—all accelerating the decrease of the salmon—and in a short time we may be glad to even get opportunities that we scorn now. A great industry as well as an immense food supply is at stake, and something ought to be done very soon.

FISHCULTURE IN CANADA.

MR. W. F. WHITCHER, formerly Commissioner of Fisheries for Canada, whose article condemning the system of fishculture pursued in the Dominion, created such a stir some time ago, now writes to the Montreal *Gazette* as follows:

SIR—Referring to "Hansard," of the 9th instant, I respectfully bring under notice the following part of a recent discussion in parliament relating to fish hatcheries in connection with an item of supplementary estimates. At p. 1536 it is reported thus:

"Mr. McLelan.—* * * I stated to the house when the estimates were under discussion, my opinion as to the success of the fish hatcheries, and the grounds upon which I hold the belief that they have been successful. I take it from the reports of all the fishery overseers, and I find from these reports that in the salmon rivers, wherever we have placed and have been for years placing the young fry, these rivers have held up or increased in their production, while rivers that have been continuously fished through that period and have not been supplied with fry are nearly fished out and have decreased in the yield. *And so with reference to the figures given by the Commissioner. They show a considerable increase of between 30 and 40 per cent. in the total catch between 1871 and 1881.* Taking the whole there is that increase, but while there has been an increase in the whole, there has been a large decrease in the rivers that have not been supplied with the young fish and fed from the hatcheries, while all the reports from the officers for 1883, and for 1882 as well, show that the rivers that have been supplied with fry have maintained their yield or largely increased it."

The words italicized are those to which I beg leave more particularly to refer. "The figures given by the Commissioner," are for the provinces in which fish hatcheries exist, and were taken by me from Vol. 3, pages 286-87 of the census returns for 1870 and 1880 respectively. They showed an increase, as correctly stated, but chiefly in districts unaffected by hatcheries. Having since more carefully examined the fisheries' schedules of the census for 1880, I have discovered (and called official attention to) a serious error in the summation of sub-districts, under the salmon column—15,935 barrels being reckoned in mistake for 7,232 barrels. The erroneous figures, by which I was myself misled and have unconsciously misled the Minister of Marine and Fisheries, gave 3,187,000 pounds of salmon, while the corrected figures give 1,446,400 pounds. Artificial operations are carried on extensively in that vicinity. The comparative totals "given by the Commissioner," I may add in perfect good faith, which are adduced as evidence of an increased catch of salmon within the decennial period of "between 30 and 40 per cent.," and which increase is alleged to be due entirely to artificial hatching, would, therefore, prove as corrected, a local difference of 1,740,600 pounds, and a general *decrease* of very nearly a quarter of a million of pounds. I take the earliest opportunity that my health will admit to amend this fault, lest the error should creep into other calculations affecting the Canadian salmon fisheries before its correction can be incorporated in the publications of the statistical department.

Under ordinary circumstances it might be supposed that such difference would not materially affect any deductions from the total salmon yield of 1880 in the maritime provinces, as the reports of the fisheries department should afford an exact or corrective basis of computation. Unfortunately the salmon catch for 1880, as given in the fisheries statements, is 63 per cent. less than that given in the census returns, even as corrected. There was every advantage, therefore, in preferring the census tables to compare data affecting artificial fishculture, although any person actuated by improper "motives" would obviously prefer the former. If, however, the fishery returns for 1870 and 1880 be taken as a basis of comparison the whole decline amounts to 2,304,347 pounds. The figures "given by the Commissioner" may, I reasonably submit, be viewed as evidence not only of a desire to be accurate, but also of the utmost fairness toward artificial fish hatching. Knowing also the defectiveness of the departmental returns, to which I so often and so vainly drew attention when in office, and have of late years for that reason refused to sign, I thought it safest to quote the census tables in preference to the others. Altogether, therefore, the census affords a just and even a generous measure as illustrating the practical results of artificial salmon hatching in Canada during ten concurrent years.

Allow me, sir, in your columns, to apologize for having been the innocent medium through whom the Hon. Mr. McLelan has thus accidentally adopted data supplied by the blue books, which, as revised, indicate a condition of things quite contrary to the desired result, and which may possibly have assisted in producing the erroneous conclusion embodied in the foregoing extract. Permit me, at the same time, to point out that the case of Nova Scotia was instanced "by the Commissioner" to show that in ten years, from 1870 to 1880, the salmon catch had declined over fifty per cent., as shown by the census, while, according to the fisheries statements, it had fallen from 1,345,905 pounds to 383,150 pounds. Above six millions of salmon fry were distributed from the Nova Scotian hatcheries during this time. Here, again, advantage was given to the claims of artificial hatching.

The fact that a decrease in salmon of 168,200 pounds according to the census returns, and of 2,304,347 pounds, according to the fisheries statements, as admitted by the official reports, forcibly suggests the advisability of revising whatever other information purports to establish that "there has been an increase in the whole."

Regarding the alleged specific increase of produce from rivers in which salmon fry artificially bred have been placed, and the corresponding decrease from rivers dependent on natural propagation, it is of primary importance that if such realization is true, the fact should be clearly established. If it can be proved there would be every reason to substitute artificial for natural methods of cultivation. Its co-existence with a general decrease is not incompatible. In order to test such a theory the individual instances must be judged by the relative proportions of natural and artificial supply forming the mature stock. That a fluctuating decline of the salmon fishery since 1874 has occurred throughout the easterly section of the Dominion of Canada it is useless and unwise to deny. A table appended proves this conclusively. The precise extent to which this declension has been arrested during a series of years on the one hand by reserving and guarding the natural spawning grounds, eradicating abuses, imposing restrictions in the modes and curtailing the periods of fishing, by constructing fishways and removing obstructions to the ascent of salmon, by opening up new and extensive breeding areas, and regulating and protecting the inland fisheries generally, and on the other hand by planting salmon fry artificially hatched; all of these elements form a fair subject for impartial inquiry from which much useful and reliable information might be derived. But any attempt to prove that all other endeavors to augment or to maintain the salmon supply from natural sources have entirely failed, and it is only from the output of the hatcheries that improvement has been effected or that normal production has been maintained, conflicts at once with the whole history of the business, extending over a series of laborious years, since 1852, and disputes recorded facts and figures existing in the journals of the House of Commons and the departmental files, which if honestly examined tell quite a different story. It also runs counter to the knowledge and unwritten experience of many sportsmen and observers acquainted with the salmon fishery in all parts of the country. The general and special reports of the principal fishery officers, including those actually in charge of hatcheries, reinforce and confirm the entire record.

Attention is drawn to the following table condensed from the fisheries statements. It gives the gross produce of salmon fishing in the river, estuary and coast districts of the provinces of Quebec, New Brunswick and Nova Scotia for each year from 1869 to 1882, both inclusive. The particulars of 1883 are not yet published, but the preliminary report of the fisheries department announces that in New Brunswick and Nova Scotia there is a considerable decrease, and a slight increase in the Province of Quebec, principally in districts remote from the hatcheries. In the Miramichi and Restigouche districts, where the best hatcheries are located, the yield is reported to have been worse than anywhere else.

TABLE OF SALMON CATCH IN QUEBEC, NEW BRUNSWICK AND NOVA SCOTIA FOR FOURTEEN CONSECUTIVE YEARS.

	Pounds.		Pounds.
1869	2,466,920	1876	2,615,555
1870	4,012,993	1877	3,332,934
1871	3,646,475	1878	3,712,476
1872	3,745,302	1879	3,102,638
1873	5,542,929	1880	1,708,645
1874	6,047,994	1881	1,282,669
1875	3,413,192	1882	2,142,886

The foregoing exhibit proves that in the three provinces named, under the natural system there was a gradual increase in the yield, indicative of progression up to the date when artificial fish hatching was resumed in Eastern Canada, namely, in 1873-74, and that, coincident with the artificial operations, a steady dimunition is observable to the latest date, 1883. It will be perceived that the quantity fell in 1881, after eight years of artificial hatching, 38 per cent. below the smallest catch under the natural system. The inclusion of earlier operations in Western Canada is not essential, as it is notorious that in Ontario salmon have been simply improved out of existence. It is a mercy to the cause of genuine fishculture to omit details.

In mentioning artificial salmon hatching as having been re-

newed in 1873 in the eastern provinces I speak by the card. Breeding salmon and trout by artificial process was first practiced in Canada by Richard Nettle, Esq., then Superintendent of fisheries, in 1858, in a Government hatchery at Quebec. The experiments were measurably successful. Mr. Nettle was enabled to deposit vivified eggs in considerable numbers and to hatch out and distribute a large proportion of living healthy fry. He also transported impregnated ova to Australia. This enterprise was authorized by several ministers, the Hon. Mr. Cauchon, Judge Sicotte and the Hon. William Macdougall. It was not continued by the latter because the limited means provided by the Legislature were absorbed in controlling and improving the salmon rivers proper, all available resources being required to guard the streams against destructive practices which had brought the salmon fishery in the Province of Quebec to the verge of ruin. Mr. Nettle, however, succeeded single-handed and with a very meagre outfit in proving the feasibility of breeding salmon and trout by artificial means, and he deserves the credit of initiation and perseverance involving severe exposure and strong personal enthusiasm. Another successful instance of artificial salmon hatching occurred in 1867, under instructions from the Hon. P. Mitchell, on the Miramichi River, N. B., conducted by Messrs. Stone and Goodfellow, assisted by W. H. Venning, Esq., Inspector of Fisheries for that Province. The system now on trial is not, therefore, a novelty; it is merely a resumption of the original operations; it was not discovered, invented nor introduced by Mr. Samuel Wilmot, although he claims the paternity and usurps the credit. The documents of the fisheries department contain all the particulars requisite to do justice in the premises.

This, however, is a small matter compared to the assertion that while natural hatching has failed to improve or even to keep alive the salmon fishery, artificial hatching has rescued and restored it. It is well known that such an idea has been familiarized by Mr. S. Wilmot to serve his own ambitious aims. He has not contented himself with unduly crediting his own share of work, but has unjustly ignored or decried the labors of others. In his reports and pamphlets this is most conspicuous. It was always to the fore in the International Fisheries Exhibition, and the proceedings of conferences and the columns of the London *Canadian Gazette* (see No. 19), attributed all the prosperity of the salmon and whitefish fisheries of the Dominion to "Mr. S. Wilmot's well-directed system of fishculture," of which he unscrupulously claimed to be the author. A recent pamphlet reiterates pretensions which now assume a semblance of authority from the conclusion above announced in parliament.

As a comparison to the table inserted above, I propose to tabulate the yearly deposits of fry in rivers and districts in juxtaposition to the annual catch in the same rivers and districts, and to compare them with each season's catch in similar streams and divisions wherein no fry from the hatcheries have been distributed. Extracts from the reports of the fishery officers in each section will also be arranged. These will be compared in another form with the production in every case before artificial hatching was applied. It should then appear intelligibly to which the salmon fishery of Canada owes most—legislative and administrative protection or artificial stocking.

Sir Alexander Campbell may be said to have laid the foundation of the system of organized protection for the inland fisheries in 1865, although, of course, the work of his predecessors was utilized away back to the time of the Hon. P. M. Vankoughnet, and throughout the able officiate of the Hon. Wm. Macdougall. Sir Alexander well knows through what difficulties he upheld a policy founded in moderation instead of radical change, and the legislature's debates of that day testify to the masterly way in which he treated the whole subject, and the peculiar interest taken in it by many other legislators. There could be no better proof of the thoroughness of the Fisheries Act than the knowledge that it has never needed amendment. While there have been passed in England since then some twenty different salmon acts, and twelve royal commissions have investigated the British salmon fisheries, the Canadian system has been worked under the same law, and all the information has been procured and the improvements have been made through the regular official staff, without imposing burdensome restrictions on fishermen or devolving extra burdens on the public. Recollecting with what virulence I was assailed for seconding (some said advising) this careful course, Sir Alexander at least can understand the spirit in which at this distant day I defend it bravely from the implication of failure. The same system was adopted by such earnest and able men as Mr. Mitchell, Sir Albert Smith and Mr. Pope. It has been successfully carried out by as zealous and useful a staff of officers as ever served under any government. Is it conceivable that all of these experienced public men and all of those energetic and intelligent subordinates who have served under them inside and outside of the fisheries department were wrong, and that only Mr. Samuel Wilmot is right? Let the facts and figures answer.

W. F. WHITCHER.

RIDEAU BANK, Ottawa, April 22, 1884.

BLACK BASS FOR HOLLAND.—On the 4th inst. the steamer Schiedam sailed with twenty-four black bass sent by Prof. Baird to the Zoological Society of Amsterdam. The fish were obtained by Mr. Blackford. Special tanks for the fish were fitted up in the steamer.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

CATBOAT.—Old paint can be removed by first burning with a painter's "torch" and then scraping with a steel scraper. Use the commonest grade of vaseline for the mast. There are a number of compositions for ships bottoms to prevent fouling. They can be obtained of shipchandlers in the large cities.

NIMROD.—1. What fish are in season at Lake George from July 15 to Aug. 15. 2. What method is used in capturing, first, lake trout, second, bass? 3. What bait, artificial or live, is used at above named locality? Ans. 1. Black bass, lake trout, pike and perch. 2. Lake trout are fished for by trolling in deep water, and by baiting a buoy and fishing it a day or two after. Black bass are taken with both the fly and with bait. 3. Minnows, frogs, crickets, etc.

W. H. C., Worcester, Mass.—What kind of ammunition did Mr. Farrow use when he made the score in Milwaukee, mentioned in your paper? Did he use patched or naked bullet? And did he clean after each shot, or shoot the score without cleaning? Ans. Mr. Farrow used the 40-cal. Bullard cannelured bullet, 300 grains. Laflin & Rand's 1 FG. powder. He did not clean in the score, but used a rubber tube to breathe in the barrel.

M., New York.—I am told that an occasional mascalonge is taken in Saratoga Lake. Please describe the tackle, bait, etc., used in fishing for them. Ans. We think it doubtful if the mascalonge is found there. The great lake pike, *Esox lucius*, is caught in Saratoga Lake, and this fish when large is often confounded with the mascalonge. Use an eight or nine-foot trolling rod, a reel holding at least 300 feet of bass line and either a gang of hooks with a minnow for bait, or a spoon. Row and troll. The fish are sometimes taken by keeping close to the weeds and at others in the middle of the stream.

INFORMATION WANTED.

Can you tell me of some good place where I can spend the last part of August and first part of September and find good partridge shooting and bass fishing? If cannot have both shooting and fishing, should prefer to give up fishing. Would like to go somewhere in the northern part of Pennsylvania or in the southern part of New York. Do not care to go as far as the Adirondacks.—W. C. M.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1213.** Volume I., bound in cloth, sent postpaid, $1.50.

THE PHILADELPHIA SHOW.

Editor Forest and Stream:

In the section of Pennsylvania round about Lancaster there are at least one hundred foxhounds, belonging to several hunting farmers, who keep them for the purpose of chasing reynard, and pride themselves on the trueness of their dogs. These gentlemen, I understand, own some splendid specimens, not valued especially for the good looks they possess but for hunting qualities, and have never exhibited them at shows, nor, indeed, have the owners ever attended an exhibition, when they really have a very good chance of winning with their animals. An effort has been made by the writer to have at least six couple of the best of these hounds brought to the bench show of the Philadelphia Kennel Club, to be held, in connection with the fair of the Pennsylvania State Agricultural Society, in September next. These hounds and representatives form the Rose Tree Hunt's pack as well as animals about West Chester and Chester, Pa., and it is hoped the Essex and Queens Counties Hunt, of New York, would make a grand feature of the show.

The beagle men, we are assured, will be out in force. New importations will have reached the United States by September, and this class will be very large. Mr. L. D. Sloan, of the American English Beagle Club, a few days since received by the steamship Indiana, from England, two additions to his kennel of little hounds—Bannerman and Myrtle—of which you will receive a descriptive account.

Why is it that the English harrier is so poorly represented at the shows in this country? Doubtless for the reason they are scarce in the United States. I know of but two genuine harriers ever having been exhibited in the States. It strikes me that good working dogs of this breed would be valuable in some sections. I will venture to prophesy that the breed will not long be neglected by Americans. Should importations be made a proper standard for judging should at once be adopted so that a well-defined difference would be established between them and the numerous cross-bred rabbit dogs, small foxhounds and so-called beagles, of which we have no many in the United States.

HOMO.

ARE DOGS DOMESTIC ANIMALS?

THE Supreme Judicial Court of Maine says no. A dissenting opinion is given by ex-Chief Justice Appleton. We are indebted to a correspondent for sending us the report in full as published in the Gardiner *Home Journal:*

STATE OF MAINE *vs.* CLIFFORD J. HARRIMAN.

Lincoln. Opinion Feb. 9, 1884.

Dogs. Domestic animals. R. S., c. 127, § 1.

Dogs are not recognized in the law as belonging to the class denominated "domestic animals."

One cannot be convicted under R. S., c. 127, § 1, (which relates to the killing or wounding of domestic animals) for killing a dog.

APPLETON, C. J., dissenting.

ON EXCEPTIONS by the respondent to the ruling of the court in overruling a demurrer to the indictment.

(Indictment.)

"State of Maine, Lincoln, ss.—At the Supreme Judicial Court, begun and holden at Wiscasset, within and for the county of Lincoln, on the fourth Tuesday of October, in the year of our Lord one thousand eight hundred and eighty-two.

"The jurors for said State, upon their oath present, that Clifford J. Harriman, of Waldoboro, in said county of Lincoln, on the twenty-fourth day of July, in the year of our Lord one thousand eight hundred and eighty-two, with force and arms, one Newfoundland dog, called 'Rich,' of the value of one hundred dollars, of the goods and chattels of John D. Miller, then and there in the inclosure and immediate care of his master being, did then and there wilfully and maliciously kill and destroy, against the peace of said State, and contrary to the form of the statute in such case made and provided."

R. S. Partridge, county attorney, for the State. *J. E. Moore*, for the defendant.

DANFORTH, J. Demurrer to an indictment found under R. S., c. 127, § 1, which provides for killing or wounding "domestic animals." The indictment alleges the killing a dog. Therefore the question involved is, not whether any particular dog or any number of dogs have become so domesticated as to be called domestic animals, but whether as a class they may properly be so called in distinction from that class known in law as *ferœ naturœ*. If the dog belongs to the latter class the indictment must fail, for the statute does not cover that class. A distinction has been recognized in the law between the two classes from the origin of the common law, from the earliest date of authentic history, when the wealth of individuals was reckoned by the number of their flocks and herds.

That by the common law the dog belongs to the wild class of animals is recognized by all the authorities, and in that state he was and is utterly worthless, his flesh even being unfit for food, so that legally he was said to have no intrinsic value, and "though a man may have a bare property therein, and maintain a civil action for the loss of them, yet they are not of such estimation as that the stealing them amounts to larceny." 4 Bl. Com. 236; 2 Bishop's Crim. Law, § 773. It is true that dogs have extensively become domesticated, so that it is usual and perhaps not an improper use of language to call them "domesticated animals," but as they still retain in a great measure their natural propensities, they may more properly be called domesticated animals with vicious habits. They still keep their wild characteristics, which ally them to the class of *ferœ naturœ*, so much so that in their domestic state they furnish no support to the family, add nothing in a legal sense to the wealth of the community, are not inventoried as property of a debtor or dead man's estate, or as liable to taxation unless under a special provision of the statute; but when kept it is for pleasure, or if any usefulness is obtained from them it is founded upon this very ferocity natural to them by which they are made to serve as a watch or for hunting.

From his greater attachment to his master in the domestic state, from which arises a well-founded expectation of his return when lost, the law gives the owner the right of reclamation, but in all other respects the owner has only that qualified property in him which he may have in wild animals generally.

These continuing instincts, from which arises the danger that he may at any time relapse into his savage state, have made it necessary in all states to have a code of laws peculiarly applicable to the dog and not applicable to domestic animals; not for the protection of his life, but rather for the protection of the community from his ferocity. *Smith* v. *Forehand*, 100 Mass. 140; 20 Albany Law Journal, 6. Under these laws the dog is recognized as property so far as to afford a civil remedy for an injury, but seldom, if ever, any other. In many cases it is made lawful for a man to kill the dog of another, as when he becomes a public nuisance. 1 Bishop, Crim. Law, § 1080, and note; and in various other instances as provided in our own State. R. S., c. 30.

Thus it will be perceived that originally the dog belonged to the class of animals *ferœ naturœ*, and that up to the present time the law has treated him as continuing in that class and has never recognized him as belonging to the domestic class. The two statutes, c. 30, R. S., and c. 127, the first relating to dogs and the latter to domestic animals are so different that they cannot be reconciled. If a person is liable to be convicted for killing a dog under c. 117, he may be punished for what he has a legal right to do under c. 30.

But as dogs have never been recognized in the law as belonging to the class denominated "domestic animals," and as domestic animals alone are mentioned, it would be contrary to all rules of construction to extend the meaning of a statute so highly penal beyond its exact terms.

Exceptions and demurrer sustained.

Barrows, Virgin, Peters, Libbey and Symonds, JJ., concurred:

DISSENTING OPINION BY

APPLETON, C. J. This is an indictment against the defendant for malicious mischief, under the provisions of R. S., c. 127, § 1, which provides that "whoever wilfully or maliciously kills, wounds, maims, disfigures or poisons any domestic animal . . . shall be punished by imprisonment not more than four years, or by fine not exceeding five hundred dollars." It will be perceived that the largest discretion is allowed in regard to the punishment to be inflicted or the fine to be imposed.

The indictment alleges that the defendant on July 24, 1882, at Waldoboro, in the county of Lincoln, "with force and arms one Newfoundland dog, called 'Rich,' of the value of one hundred dollars of the goods and chattels of John D. Miller, then and there in the inclosure and immediate care of master being, did then and there wilfully and maliciously kill and destroy, against the peace of said state and contrary to the form of the statute in such case made and provided."

To this the defendant has demurred, thereby admitting the truth of the allegations contained in the indictment.

The main question is whether a dog is a "domestic animal," for if he be, the defendant is guilty by his own admission and should be held criminally liable.

A dog is the subject of ownership. Trespass will lie for an injury to him. Trover is maintainable for his conversion. Replevin will restore him to the possession of his master. He may be bought and sold. An action may be had for his price. The owner has all the remedies for the vindication of his rights of property in this animal as in any other species of personal property he may possess.

He is a domestic animal. From the time of the pyramids to the present day, from the frigid pole to the torrid zone, wherever man has been there has been his dog. Cuvier has asserted that the dog was perhaps necessary for the establishment of civil society, and that a little reflection will convince us that barbarous nations owe much of their civilization above the brute to the possession of the dog. He is the friend and companion of his master—accompanying him in his walks, his servant, aiding him in his hunting, the playmate of his children—an inmate of his house, protecting it against all assailants.

It may be said that he was "*ferœ naturœ*," but all animals, naturalists say, were originally "*ferœ naturœ*," but have been reclaimed by man, as horses, sheep or cattle; but, however tamed, they have never, like the dog, become domesticated in the home under the roof and by the fireside of their master.

The dog was a part of the agricultural establishment of the Romans and is treated of as such. There were the *canes villatici* to guard the villa of the Roman senator, *canes venatici* accompanying him in his hunting expeditions, and the *canes pastorales* by whom his flocks were guarded. Virgil, in his Georgics, has given directions as to their management and education. To-day, in many countries they are used for draught, as in France and Holland, and everywhere regarded as possessing value and as the subject matter of traffic.

The language of the statute is most general, "*any* domestic animal." The words are not technical or words of art. They are the words of the common people and should be construed as such. Nothing would more astonish the people for whom the laws are made than to learn that a bull or a hog was a domestic animal and that a dog was not.

The lexicographers define a dog as a "domestic animal." "A well known domestic animal of the genus *canis*." Worcester's Dictionary. In Bouvier's Law Dictionary, he is defined as "a well known domestic animal." Otway the poet, says of them:

> "They are honest creatures
> And ne'er betray their masters, never fawn
> On any they love not."

So, in the encyclopedias he is *canis familiaris*, and called a domestic animal; so that in the ordinary use of language he is within the clear provisions of the statute under which this indictment was found. "The *domestic* dog has occasioned many legal disputes and the presumption of the common law of England is that he is tame." Campbell on Negligence, § 27.

By R. S., c. 6, § 5, a tax is imposed on dogs. This is a distinct and statutory recognition of their being property and having value, and that the owner has the same rights to their protection that he has for anything else he may own. In New York, dogs were taxed and this was held to be a statutory recognition of them as property and that they were the subjects of larceny. In *The People* v. *Maloney*, 1 Park (N. Y.), Cr. 598, the court say that if there was no statute on the subject, they should feel bound by the rules of the common law, "but the revised statutes are inconsistent with the common law rule. By them dogs are so far regarded as property as to be in certain cases the subject of taxation. The owner is made liable for the acts of his dog, thus recognizing that the dog has an owner and consequently that the thing owned is property. For every civil purpose, not only by statute, but by the decisions of courts, a dog is regarded as property." "All of the distinctions as to animals *ferœ naturœ*," observes SETTLE, J., "as to their generous and base natures, which we find in the English books, will not hold good in this country.

We take the true criterion to be the value of the animal, whether for the food of man, for its fur or otherwise."

In the present case the Newfoundlad dog, "Rich," of the value of one hundred dollars, was "in the inclosure and immediate care of his master." He was domesticated.

Whether the property of the master was originally of a qualified nature or not is immaterial. The dog was under his dominion and control. "While this qualified property continues, it is as much under the protection of the law as any other property, and every invasion of it is redressed in the same manner." 2 Kent's Com. 349.

A dog being a "domestic animal" and property an indictment is maintainable under R. S., c. 127, § 1, for his malicious destruction. When the statute made malicious mischief indictable, it was held that a dog was the subject of absolute property and the killing of one under the act prohibiting malicious mischief was an indictable offense. *State* v. *Sumner*, 2 Porter (Ind.), 377. There is such property in dogs as to sustain an indictment for malicious mischief. *State* v. *Latham*, 13 Iredell, 33. In *State* v. *McDuffee*, 34 N. H. 523, which was like this, for maliciously shooting a dog, FOWLER, J., says, "We can see no reason why the property of its owner in a valuable dog is not quite as deserving of protection against the wilful and malicious injury of the reckless and malignant, as property in fruit, shade or ornamental trees, whether standing in the garden or yard of their owner or in a public street, or any other species of personal property." Dogs have been included under "property" and their malicious destruction has been held indictable. 2 Wharton's Cr. Law, 1083. *A fortiori* is it so, when the owner is subject to taxation for his dog.

It is objected that the indictment does not describe the dog as "a domestic animal." But that is not required, if he be one, any more than it would be to say that a bull, a ram or a sow is a domestic animal. When the statute made it indictable "maliciously" to wound, kill, etc., any horse, cattle or other "domestic beast," an indictment for wounding a hog, without averring that it was a "domestic beast," was held on the English authorities to be good. *The State* vs. *Enslow*, 10 Iowa, 115. If the court will take cognizance that a hog or a bull is a domestic animal or beast without its averment in an indictment, much more will they that the dog is such animal.

Reliance is placed on R. S., c. 30, § § 2, 3 and 4, which impose certain liabilities on the owners of dogs. But these provisions, instead of sustaining, negative the defense. They imply ownership and liability on the part of the owner. They assume the relationship of the household. They recognize the domesticity of the dog—as having an owner or keeper, and of minors and servants as owners and keepers, and make the parent guardian, master or mistress of such minor or servant responsible for the damages done by the dog so owned. The dog appertains to the household of which the master or mistress is made liable for his misdoings. The owner or keeper thus made responsible for the misdoings of his taxable dog or that of his children should not be left without legal protection when this property is wilfully and maliciously destroyed.

It is true that by § 2, any one may kill a dog under certain conditions therein set forth. But the very section impliedly negatives the right to kill except only when those conditions exist. By its provisions "any person may *lawfully* kill a dog that assaults him or any other person when *peaceably* walking or riding, etc. But it gives no general right to kill dogs. The killing is only *lawfully* done when the person killing is peaceably walking or riding, etc., and not otherwise.

It is said that "if a person is liable to be convicted for killing of a dog under c. 127, he may be punished for what he has a legal right to, under c. 30." Not so. He cannot be punished under c. 127, if the killing was justified under the provisions of c. 30. The statutes are perfectly consistent.

But it is argued that the indictment should negative the authority

to kill in the cases mentioned in § 2. Such is not the law. The indictment follows the statute. It sets forth clearly an offense. If committed, it is for the accused to establish a justification. When the enacting clause of a penal statute describes the offense with certain exceptions it is necessary to state in the indictment all the circumstances which constitute the offense and to negative the exceptions. *State* v. *Keen*, 34 Maine, 501. But this principle is not applicable here.

It is to be remarked that the statute, c. 209, of the laws of 1877, requiring the licensing and registration of dogs and that they should wear a collar round the neck with the owners' name thereon; was repealed by c. 72, of the laws of 1878. If it would have been necessary; had the first named statute been in force to have set forth in the indictment, as in *State* v. *McDuffee*, 34 N. H. 527, the facts of such license and registration, which we think it was not, the statute being repealed, those allegations would no longer be required.

The decisions cited in support of the defense do not apply. In *Blair* v. *Forehand*, 100 Mass. 137, and in the other cases in Massachusetts, the killing of dogs was justified under the police laws of the State authorizing the killing of dogs not licensed nor having a collar. But there are no such statutes in this State—hence their utter want of applicability. *Exceptions overruled.*

ENGLISH KENNEL NOTES.

WE have got through the field trials at Shrewsbury, and those of the Kennel Club at Stafford. There is now the usual diversion of opinions. It seems to be generally agreed that the club's were a bad second. The Shrewsbury people who have never acknowledged nor submitted to the aggresive patronage of the Kennel Club were hardly treated by the weather, and partly to the weather must it be ascribed, I think, that the pointers results show up so handsomely against their long-haired field colleagues.

Our *Field* has drawn attention to the fact that setters are certainly first favorites on the bench and also points out with regret that so few Gordon setters are seen in the trials. This is the more surprising because on the continent, and in France particularly, they are quite the favorite sporting dogs. The *Field* reporter also utters a very old plaint, "that the handsomest dogs on the bench are not the best in the field." But I really attach no value to that. I should scarcely expect the contrary with a dog that requires so much care and attention as a show dog does. What time can there be to break or work him? Against this, however, I set up that from these beautiful prize winners you can breed handsome pups to break to your gun. It is the old argument in another more special form that for intelligence and usefulness no patrician of the canine race can hold his own against the thorough bred mongrel, but I don't think this trite saying which is seen through with a little trouble could ever induce me to change my noble mastiff for my butcher's yard dog.

By far the best report that has appeared of the trials is that in the *Stock Keeper*. General regret was expressed that Mr. Llewellin should have been out of it this year, but it speaks well for the conscientiousness of this gentleman that he did not send one entry from his kennel where distemper existed, to jeopardize the lives of other people's dogs. In this honorable action he showed a very different feeling to that displayed by the chief actor in the unpleasant case that is at present engaging doggy men's attention in the columns of the *Field* under the heading or "Kennel Club Justice."

Besides their excellent report the *Stock Keeper* this week prints some interesting notes on the competitors in the trials from the pen of Mr. G. Morpe Bartram, who ought to be at home on this subject. The result of the Derby can hardly be considered satisfactory apart from the disappointment to Dr. Salter it seems barely just that his young pointer Paris should have lost a good chance of winning such a valuable stake for being only four minutes late on the ground. The winner of the Derby was beaten in the all-aged stakes and Malt solaced his owner for the loss of the Derby by winning the first prize. Mr. Wm. Richardson has written to the papers to complain of an unusual occurrence, that of Mr. Shirley declining to be guided by the rules of the Kennel Club of which he is chairman. It was about an undecided heat that should have been run off first of all next day, and Mr. Shirley ignored the rule to this effect.

Mr. Herbert Watson, an undergraduate of Cambridge, has taken up the cudgel on behalf of Lawrence, a very respectable dog dealer of that town, who was lately convicted before a county court judge of stealing a lady's black and tan terrier. The judgment was quite in opposition to the evidence, and shows what a lottery it is to take a dog or horse case before a law judge. The evidence proved clearly to a doggy man that Lawrence's terrier could not have been the one lost by Mrs. Murray. Part of the evidence in Lawrence's favor turned upon how long cropped ears take to heal. One of the marks by which Mrs. Murray said she would know her dog was an enlarged navel. This is well known to be a very common thing indeed, but the judge, being an outsider, did not know it; and he made up his mind directly he saw the dog look pleased to see Mrs. Murray and lick her hands. He felt quite happy in the precedent of Solomon and the babe. There are lots of pet dogs with little character who will fawn on anybody who speaks to them, and especially on ladies. A good many of our dogs would pass out of our possession if this trait were to be accepted as a certain indication that dogs belong to those they jump and fawn upon.

It is very hard lines upon Lawrence, who loses his dog and character, purse and reputation, from the specialist ignorance of a lawmonger.

Dr. Forbes Winslow and Messrs. Taunton and Portier are still arguing over the award of the last-named at Warwick, where he gave the breeders' prize to the progeny of Crown Prince and the stud prize to Cardinal. This is a smart reversal of judgment. Messrs. Portier and Taunton are racking their brains weekly to reconcile the contradiction with common sense, but the Doctor wins easily.

To those behind the scenes the joke of the matter is that Dr. Winslow was lately the main stay of the British Kennel Association. This curious body was founded by Mr. Taunton, who, till then, had only been known as the runner of an amateur menagerie of foreign dogs. He founded the B. K. A. for what purpose except to make himself known has never been made clear. The Association adopted the rules of the K. C., undertook to publish a register of dogs for sale and hold two shows a year. A good many men joined it, as they always will anything new. They held a show at Aston, which is so near Birmingham as to lead one easily to surmise that it was in opposition to the annual town show. The schedule was the most perfect of its kind that has been composed, and the result was a fair entry, but nothing in proportion to the expectations of the B. K. A. Their greatest disappointment, though, was in their "gate," which produced an insignificant sum. The result was a big deficit to the society, which then, for all practical purposes, ceased to exist.

It would be churlish not to admit the extraordinary capacity for hard work displayed by Mr. Taunton in the hour of their distress. Although not a popular man among his fellows, he is shrewd and practical.

The Association has not been formally dissolved, but the resignations have flowed in so freely from its independent members, who did not relish the role of bottle-holder to the K. C., that I think only two are left, Taunton and Portier, whose common tie is brindle-mastiffs and black and tan terriers. Now and then one sees in the schedules, "A medal given by the British Kennel Association;" but medals are cheap, and the outlay can't ruin the dual control.

The latest *on dit* is that Mr. Taunton has joined Mr. Morrel (of inky fame), one of his late B. K. A. supporters, in business.

Mr. Portier is doing good work in the papers by standing up for the Black and Tan Terrier Club and natural ears. His most zealous opponent has been a Mr. Henry Lacy, of Manchester, who champions cropping, and gave all those who disagree with him a wholesale slanging a fortnight ago. He has since been effectually sat upon, and I think he must wish he had burnt his pen and broken his ink bottle.

To put down cropping is, I am afraid, more than lies in the power of a specialist club, but I commend their humane spirit for trying. The Kennel Club could do it—but won't. One good reason for their not moving in the matter is that the chairman is an active supporter of cropping by his own deeds. Why does not the Society for the Prevention of Cruelty to Animals take it up? Let them make Mr. Shirley their test case, he won't deny it, he will candidly inform them that he crops all his own bull-terriers. The Society is an influential one, and as it is backed by the Baroness Burdett-Coutts, they are not likely to want for funds to carry out what would most certainly be a successful prosecution.

The Baroness Burdett-Coutts, true to her instincts of kindness to all dumb animals, has expressed her appreciation of the Black and Tan Terrier Club's intention of prohibiting cropping by offering to become its patroness. I heard lately a very pleasing anecdote of her ladyship's good nature. She had learned that fortune had frowned severely on a veterinary surgeon in the west end of London, a man whose name had become endeared to many slaves of their pets. She wrote to the vet. that she wanted a mastiff. In a few days he sent her one, with a note saying he had bought the accompanying dog for her ladyship for £14. The Baroness kept the dog and sent a check for it with a nought at the end of the figures, and a kind little note hoping his luck would turn.

The show organized by Messrs. Sanger, the menagerie people, at Margate, has passed over with the usual amount of unpleasantness. It has always been a third-rate affair, organized only to put money in the pockets of Messrs. Sanger and the hotel keepers of Shoreditch-on-Sea. Each year they tempt exhibitors with the same false bait, one being to advertise thas the railway will carry exhibitors and their dogs at single fares, and when it is complained that this is not the case, the exhibitor is roughly referred to the railway company, which "knows nothing about it." They practice also the trick of refusing the money prize to a dog that wins the cup. One year an extraordinary disclosure of their meanness was made. An exhibitor picked up a five-guinea prize (a cruet) off the stand and found the price marked in plain figures underneath—fifty shillings! This year the management and the keepers insulted exhibitors right and left. One gentleman, a member of the London Stock Exchange, was coolly called a liar by one of the keepers, and in complaining to a member of the committee was bluntly informed that he had no time to bother about it. In a competition for bad manners it is hard to say who would win, the men of Margate or those of Hertford.

I observe in your issue of the 8th inst., a report of the Warwick dog show; your readers will have the amusement of comparing my notes with the opinion of your reporter. From the prize list of the New York show I see you had a remarkable entry. I have not heard yet who won in St. Bernards, but I would lay liberal odds against the Rev. Cumming Macdona. Your late importations have gone beyond his kennel.

The schedule for the Crystal Palace is out. It contains one improvement, that is, rescinding the rule that if four dogs compete in a class only one prize would be awarded; all will be given now. This is liberal and right; now I wonder whether they will abolish another objectionable feature of their shows which was far more reprehensively grasping; that of charging re-admission, half a crown at a time on judging days. As there was no accommodation in the show it was more than avaricious, it was brutal.

The York show is very near and sportsmen wish them success and a big entry for their new class for pointers and setters that have run at field trials, it is an excellent idea and deserves support to make it worth copying at other shows.

Mr. Murchison continues the Lochinvar correspondence in the *Field* this week, and to the inexpressible astonishment of on-lookers has effectually secured the support of the editor A few new replies have been vamped up, but Mr. Murchison cannot get away from the fact that he suspected his dog to be sickening for distemper two hours before the judging and only thought it expedient to get him removed after he had won a prize. The Hertford Committee will be blamed for the offensive manner in which they have defended their manager's conduct and the Kennel Club Committee for the partiality shown to one of themselves who was charged with a serious offense. Mr. Percy Reid is charged, tried and condemned by public opinion.

Correction.—In my notes of April 8, for Dr. Maurier read Du Maurier. LILLIBULERO.

MAY 20, 1884.

BEAGLES AT NEW YORK.

Editor Forest and Stream:

As the beagle judging at the late New York show seems to have given rise to some discussion among the members of the A. E. B. C., perhaps it would be well timed to quote a description of this interesting little hound from some of our acknowledged best authorities on dogs. First let us quote Stonehenge; he distinctly says: "The points of the beagle are similar to those given for the foxhound, except as to head and ears, the former being much larger proportionally, both in width and height, while the latter are almost like those of the bloodhound in size and hanging."

Dalziel gives as an illustration "measurements of two good dogs," viz.: Mr. H. A. Clark's Comely—Weight, 27½ pounds; height at shoulder, 14½ inches; length from nose to set on of tail, 30 inches; length of tail, 11 inches; girth of chest, 21 inches; girth of loin, 18 inches; girth of head, 13½ inches; girth of forearm, 5½ inches; length of ears from tip to tip, 17 inches. Mr. H. A. Clark's Crowner—Weight, 26½ pounds; height at shoulder, 15 inches; length of nose to set on of tail, 31 inches; girth at chest, 22 inches; girth of loin, 18½ inches; length of ears from tip to tip, 17½ inches.

Vero Shaw says: "In the present day the average height of the working pack is about 14½ inches, which is sufficiently small for the purposes for which they are required," and further, "As regards a standard of points for judging this breed, we cannot do better than refer our readers to that given in the foxhound chapter, as the beagle, with the exception of its size, can be satisfactorily judged by the scale used in judging foxhounds." In writing of the dwarf specimens, he says: "One of the most remarkable little packs which ever came beneath our notice, was shown by Mr. G. H. Nutt, of Maidstone, at the Alexandra Palace show of 1877. During the progress of the exhibition Mr. Nutt treated his friends to a glimpse of his pigmy pack at work, for he ran them a short drag in the grounds, much to the delight of many lady visitors. Mr. Nutt has since informed us that he has been compelled to give up his pets, as the difficulties he had to encounter in his breeding operations, from the small size of his bitches, fairly tired him out. As he somewhat pathetically remarked: "They had hardly the strength to produce their young, and when they succeeded in doing so, were actually too weak to bring them up." And again, speaking of Mr. Crane's noted pack, he says: "The standard is kept up with much difficulty, many of his mothers do not rear their offspring, and distemper carries them off in troops, specimens are found excessively dwarfed, and proportionally deformed."

The opinions of the above authorities should convince intelligent breeders, and by that I mean those who are trying to breed a useful hound, that an average height of fourteen inches is sufficiently small for all available purposes. Let the A. E. B. C. endeavor to improve the form of the beagle and breed out the open feet, weak pasterns, bad chests and weak loins that are too prevalent, and produce a dog that will give the keenest enjoyment in the chase and the least anxiety in the breeding kennel. Delicacy of scent and perseverance are essential qualities in the beagle, and the tongue should be rich and melodious, and to get the deep, rich note there will always be more or less dewlap or throatiness.

The writer has enjoyed many capital runs in the west of England, and knows of no more beautiful sight than to see a pack of these little fellows on the side of a hill, where a sheet would almost cover them, and although it was tolerably easy to keep with them on a hilly country, they would test the staying qualities of our most fleet-footed runners on the

FLAT.

POINTERS AT NEW YORK.

Editor Forest and Stream:

I could hardly believe my eyes when I saw in your pages that Beaufort, the dog whom no less an authority than FOREST AND STREAM pronounced one of the best dogs of his kind in America; the dog whom some of the most experienced of breeders have found to be almost the ideal of a pointer, answers (in the opinion of Mr. Cornell) to this description: "His legs are extremely bad, being crooked fore and aft, his pasterns are bent in so that the dog is actually bow-legged, and his hocks are likewise also bent." Besides, "he is too long on the legs and stilty, and has a very heavy throat." Can it be possible that so many of us, FOREST AND STREAM included, have been admiring a pointer with such outrageous defects as these? Have we been worshipping an idol so clumsily defective as this? Our ignorance has certainly been pitiable, and kindly Mr. Cornell desires to remove the scales from our eyes. Not having seen Meteor and Bang Bang, I shall certainly not disagree with Mr. Cornell in his good opinion of them. But if his vision is as crooked with regard to them as it is with regard to Beaufort, they may not be perfection after all. Either Beaufort has become fearfully deformed since I saw him last, or Mr. Cornell studies certain dogs through defective glasses, which distort the appearance of the object. Let Mr. Cornell back up Mr. Sterling's judgment if he chooses, but let him not try to do so by maligning Beaufort. I do not own a hair of Beaufort, but I love the dog for himself alone and am ready to defend him against all comers. That Mr. Sterling was wrong in his decision I, not having seen Meteor, do not pretend to say. That Mr. Sterling is no judge of a pointer, his opinion that Faust II. was superior to Beaufort was enough to thoroughly convince me. T. B. DORSEY.

ELLICOTT CITY, Md.

THE DOG POUND OPENS.—Mayor Edson yesterday reappointed John McMahon keeper of the dog pound, at a salary of $75 a month, with the following assistants: Edward J. Dunn, clerk, $75 a month; Michael Dempsey, Thomas Gillam, and Patrick Goodwin, workmen, $2 a day, and George Riley, John Vandewater, and Michael Murtha, catchers. Last year the catchers received a fee of 40 cents for each dog caught. This year Mayor Edson fixed the same fee, despite the requests of the catchers that it be made 50 cents. When the catchers learned of the Mayor's actions they promptly declined the positions, but were finally induced by the Mayor's clerk, Mr. Augustus Walsh, to at least begin work at the price offered by the Mayor. In determining whom he should select to fill the important positions connected with the capture and disposal of stray dogs the Mayor was materially assisted by a number of distinguished gentleman, among them Sheriff Davidson, Senators Plunkitt and Cullen, Assemblyman Haggerty, and Aldermen McQuade, Dempsey, and De Lacy. So earnest have these gentleman been in their desire to assist the Mayor in his arduous labors that they have, unwittingly, of course, made the Mayor's life a burden to him and caused Mr. Walsh, who has had this subject upon his mind, to fear that he would lose his reason. The ground taken by Senator Plunkitt was that while the position of dog-catcher might be considered a pretty small matter for a Senator to worry himself about, yet he was obliged to "protect his district." Senator Plunkitt's "man" was not appointed, but Senator Cullen's was and so were those of the three Aldermen named. All the appointments were made subject to the appointees passing the civil service examination. Accordingly, yesterday afternoon the newly appointed city officers appeared before Civil Service Examiners Arthur H. Dundon, Chairman; Daniel B. Smith, and James Moir, in the College of the City of New York. Mr. Dundon did not consider it necessary to examine the gentlemen regarding their acquirements in trigonometry or the exact sciences, but he interrogated them regarding their moral fitness for the capture of dogs. He questioned Mr. McMahon to learn if they were ever sober, and after a course of sprouts he came to the conclusion that their intellectual and moral sensibilities just about balanced each other. The dog-catchers were informed that any well-grounded complaint against them would insure their immediate dismissal from office, and they were required to furnish references of character. The pound will be opened with imposing ceremonies to-morrow.—*N. Y. Times, June 2.*

IMPORTATION OF BEAGLES.—Philadelphia, May 29.—*Editor Forest and Stream:* The steamship Indiana, which arrived at this port from Liverpool May 25, brought a couple of beagles consigned to Mr. Louis D. Sloan of West Philadelphia. They were purchased of Edwin S. Carew-Gibson, Esq. of Sussex, England, the noted beagle breeder, and were selected expressly to order. The dog Bannerman, bred by Mr. J. Crane, of Southover House, I will describe first. Bannerman is a white dog with lemon head markings; he is eighteen months old, and stands eleven inches high; his head is of the highest beagle type, and his ears, which have a spread of full fourteen inches, are grandly hung. In fact, they are a striking feature. Bannerman is clean in throat, not a suspicion of dewlap, his neck, shoulders, chest and ribs are of the best, while his legs and feet are simply perfect, and a strong back and well arched loin gives him a harmonious finish. In coat he is wonderfully good. His tail is the true beagle's, well brushed and elegantly carried. In general appearance he is jaunty and stylish. I consider him the most desirable beagle dog I have ever seen. He cost his owner a high figure, but the best are almost beyond purchase, and his owner may congratulate himself on having a dog he may well be proud of. Bannerman's full pedigree with particulars will appear in a later issue of the FOREST AND STREAM. It need only be mentioned here, that he is a worthy son of the famous English beagle champion Marchboy. After Bannerman the best will suffer in comparison, so we will merely glance at his kennel companion, the bitch Myrtle, to say that she is a neat beagle of about thirteen inches height, nice in color, excellent ears and good in general appearance, but being heavy in whelp (to champion Marchboy) is in no shape to submit to an extended criticism, therefore will be left for future comments.—RUSTICUS.

THE RETRIEVING PRIZE AT NEW YORK.—The special prize for the best retriever at the New York show was awarded to Mr. A. C. Collins's Fritz. After the award was made it was discovered that owing to a clerical error his number was the only one entered in the steward's book. As there were other entries, the class was rejudged and the medal was awarded to Mr. Luke W. White's Grace. Mr Collins having gone home, did not compete. We received letters from both gentlemen last week, but too late for us to ascertain and publish the facts in the case.

BLACKSTONE KENNEL.—Mr. W. Tallman, in connection with Mr. C. Fred Crawford, of Pawtucket, R. I., has fitted up extensive kennels at South Attleboro, Mass., for the purpose of breeding dogs. With champion Foreman and Mack B. in the stud, and the well bred bitches owned by them, they should succeed in turning out some fine animals.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal:*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Obo G. By Mr. A. W. Griffiths, Newmarket, N. H., for black, with white on breast, cocker spaniel dog, whelped Jan. 28, 1884, by Obo II. (A.K.R. 432) out of Ace of Spades (Lantern—Midnight.)

Jolly Planter and Lady Nimble. By Mr. E. W. Jester, St. George's, Del., for blue belton English setter dog and lemon belton bitch, whelped March 22, 1884, by champion Plantagenet out of Countess Flirt.

Dashing Foreman. By Mr. C. Fred Crawford, Pawtucket, R. I., for black, white and tan English setter dog, age not given, by champion Foreman out of Nellie II. (Count Noble—Rosalind).

Slam Bang and Princess of Thule. By Mr. Edward Dexter, Buzzard's Bay, Mass., for black and white pointers, dog and bitch, whelped Jan. 6, 1884 (Bang Bang, A.K.R. 394—Fan Fan).

Fairy. By Mr. E. M. Crouch, Thomaston, Ct., for lemon and white pointer bitch, whelped Jan. 1, 1884, by Sam, Jr. (Sam—Countess Nelly, A.K.R. 913) out of Quilley (Spot—Countess Nelly, A.K.R. 913).

Editor Forest and Stream: In your issue of May 22, in claiming the names Count Ranger, Prince Ranger, Bang Ranger, Drake Ranger, Minnie Ranger, Drab Ranger and Nell Ranger, you give the color lemon and white. That is an error; it should be liver and white.

ROSENDALE, Wis., May 24, 1884. S. B. DILLEY.

NAMES CHANGED.

☞ *See instructions at head of this column.*

Dashing Armand to Doctor T. Black and white English setter dog, 1yr. old (Dashing Monarch—Armida), owned by Mr. Wm. Tallman, South Attleboro, Mass.

BRED.

☞ *See instructions at head of this column.*

Whiskey—Nattie. Mr. Charles Lincoln's (Detroit, Mich.) fox-terrier bitch Whiskey to Mr. R. C. Cornell's Nattie (Gamester—Feefee), May 25.

Elgg—Tweed II. Mr. Thomas H. Terry's (New York) collie bitch Elgg (Gillie—Watch) to his champion Tweed II. (A.K.R. 894), May 22.

Roberto Laverack—Dash III. Dr. J. R. Housel's (Watsontown, Pa.) English setter bitch Roberto Laverack (A.K.R. 1071) to Mr. A. M. Tucker's Dash III.

Honor Bright—Friday Night. Mr. H. W. Smith's (Worcester, Mass.) black greyhound bitch Honor Bright (A.K.R. 902) to his champion Friday Night (A.K.R. 753), May 29.

Doe—Chief. Mr. Max Wenzel's (Hoboken, N. J.) red Irish setter bitch Doe (Buck—Floss) to his Chief (A.K.R. 231).

Beulah—Zanzibar. Mr. E. W. Jester's (St. George's, Del.) English setter bitch Beulah (Count Derby—Dashing Countess) to his Zanzibar (A.K.R. 1182), May 25.

Jessie Turner—Dashing Lion. The Ohio Kennel's (Washingtonville, O.) English setter bitch Jessie Turner (Druid—Ruby) to their Dashing Lion (Dash II.—Leda), May 14.

Armida—Dashing Lion. Dr. R. F. Tull's (Elkton, Md.) English setter bitch Armida (Leicester—Pocahontas) to the Ohio Kennel's Dashing Lion (Dash II.—Leda), May 2.

Roxie—Dashing Lion. The Ohio Kennel's (Washingtonville, O.) English setter bitch Roxie (Leicester—Nellie) to their Dashing Lion, May 4.

Gipsy Belle—Foreman. Mr. Wm. Tallman's (South Attleboro, Mass.) English setter bitch Gipsy Belle (Gladstone—Pearl) to champion Foreman, April 24.

Forest Dora—Foreman. Mr. Wm. Tallman's (South Attleboro, Mass.) English setter bitch Forest Dora (A.K.R. 500) to champion Foreman, May 20.

Cliney Carter—Foreman. Mr. J. J. Scanlan's (Fall River, Mass.) English setter bitch Cliney Carter (Cashier—Flake) to champion Foreman, May 11.

Daisy II.—Young Toby. Mr. W. D. Peck's (New Haven, Ct.) pug bitch Daisy II. (Major—Beauty) to the Chequasset Kennel's Young Toby (A.K.R. 473), April 18.

Jet—Black. Mr. C. F. Keys's (Washington, D. C.) Gordon setter bitch Jet (A.K.R. 960) to Mr. H. Malcom's Black (Malcolm—Dream IV.), May 29.

Lady Mab—Knickerbocker. Mr. H. C. Miller's (Hudson, N. Y.) pointer bitch Lady Mab (A.K.R. 1044) to champion Knickerbocker (A.K.R. 19), May 27.

WHELPS.

☞ *See instructions at head of this column.*

Daisy Deane. Mr. Elliot Smith's (New York) pointer bitch Daisy Deane (Old Zip—Lady Flora), May 21, eight (one dog), by the Westminster Kennel Club's Bang Bang (A.K.R. 394).

Rose. The Westminster Kennel Club's pointer bitch Rose (A.K.R. 214), May 15, ten (five dogs), by their Bang Bang (A.K.R. 394).

Leah. Dr. J. R. Housel's (Watsontown, Pa.) English setter bitch Leah (Roybel—Livy II.), May 26, six (three dogs), by Mr. Thos. Blythe's Robin Hood (Carlowitz—True).

Annie Laurie. Mr. W. A. Faxon's (Dorchester, Mass.) collie bitch Annie Laurie (Marcus—Isle), six (five dogs), by Rattler (Tweed II.—Lassie).

Brenda. Dr. M. G. Elizey's (Washington, D. C.) English setter bitch Brenda (Pride of the Border—Kirby), May 22, eight (seven dogs), by Mr. N. Jensen's Cossack (Morford's Don—Fairy).

Flake II. Messrs. Wheeler & Davis's (Rockland, Mass.) English setter bitch Flake II. (A.K.R. 367), April 24, nine (four dogs), by Ben B. (A.K.R. 363).

Dashing Jessie. Mr. E. W. Jester's (St. George's, Del.) English setter bitch Dashing Jessie (A.K.R. 815), May 28, six (one dog), by his Zanzibar (A.K.R. 1182).

Winnie. The Kilmarnock Collie Kennel's (Boston, Mass.) imported collie bitch Winnie (Gairlock—Laurie), May 25, nine (five dogs), by their Bruce (Marcus—Isle).

Gem. Mr. Geo. L. V. Tyler's (West Newton, Mass.) cocker spaniel bitch Gem (Snip—Feather), April 27, six (five dogs), by Obo II. (A.K.R. 432); all black; two dogs dead.

Queen Anna. The Ohio Kennel's (Washingtonville, O.) English setter bitch Queen Anna (Zanzibar—Lady Elgin), May 15, sixteen (ten dogs), by their Dashing Lion.

SALES.

☞ *See instructions at head of this column.*

Sensation—Rose whelps. Lemon and white pointers, whelped Oct. 29, 1883, by the Westminster Kennel Club, a dog to Mr. D. G. Elliot, New Brighton, S. I.; a bitch to Dr. Twomly, Baltimore, Md., and a bitch to Mr. Elliot Smith, New York.

Robin Hood—Countess H. whelps. Lemon and white English setter dogs, whelped Jan. 18, 1884, by Dr. J. R. Housel, Watsontown, Pa., one to Mr. B. W. Prentice, Worcester, Mass., and one to Mr. A. S. Oliver, Elberton, Ga.

Lady Mab. Black pointer bitch (A.K.R. 1044), by the Knickerbocker Kennel Club, Jersey City, N. J., to Mr. H. C. Miller, Hudson, N. Y.

Doncaster. Liver and white pointer dog (A.K.R. 563), by the Knickerbocker Kennel Club, Jersey City, N. J., to Mr. Jas. H. Hildebrandt, Johnstown, N. Y.

The Banshee. Scotch deerhound bitch, 3yrs. old (Grab—Ready Money), by Mr. H. W. Smith, Worcester, Mass., to Mr. C. B. Gilbert, New Haven, Ct.

Obo G. Black cocker spaniel dog, whelped Jan. 28, 1884 (Obo II.—Ace of Spades), by Mr. Geo. H. Gilbert, Boston, Mass., to Mr. A. W. Griffiths, Newmarket, N. H.

Warren. Red Irish setter dog, whelped Sept. 6, 1883 (Elcho, A.K.R. 295—Zelda, A.K.R. 240), by the Shamrock Kennel, Beach Bluff, Mass., to Mr. A. O. Brewster, Boston, Mass.

Nip and Tuck. Red Irish setter dogs, whelped Sept. 6, 1883 (Elcho, A.K.R. 295—Zelda, A.K.R. 240), by the Shamrock Kennel, Beach Bluff, Mass., to Mr. Edward Jewell, Boston, Mass.

Chief—Maud S. whelp. Red Irish setter dog, whelped April 8, 1884, by Mr. Max Wenzel, Hoboken, N. J., to Mr. McMicken, New York.

Hector. Mastiff dog, whelped Jan. 26, 1884 (Diavolo, A.K.R. 543—Madge, A.K.R. 548), by the Ashmont Kennel, Boston, Mass., to Mr. Dwight Holbrook, Clinton, Ct.

Teddy Barr—Vic whelp. Liver and white cocker spaniel dog, whelped March 6, 1884, by Mr. Archibald Gordon, Middletown, N. Y., to Dr. J. Corbin, Brooklyn, N. Y.

Dixie and Silk. Foxhound dogs, by Mr. R. B. Houghton, Boston, Mass., to Mr. W. C. Crandall, Springville, N. Y.

Toby. Pug dog, whelped Dec. 3, 1883 (Napoleon—Beauty), by Mr. W. D. Peck, New Haven, Ct., to Mr. A. C. Wandor, Hartford, Ct.

Bess. Pug bitch, whelped Dec. 3, 1883 (Napoleon—Beauty), by Mr. W. D. Peck, New Haven, Ct., to Mr. Fred. E. Parker, same place.

Calypso. Mastiff bitch (E.K.C.S.B. 10,567), by Mr. Jas. Hutchings, Exeter, Eng., to Mr. W. D. Peck, New Haven, Ct.

Ashmont. Red Irish setter dog, whelped March 17, 1884 (champion Nimrod, A.K.R. 631—Romaine, A.K.R. 638), by the Ashmont Kennel, Boston, Mass., to Mr. Chas. S. Davol, Warren, R. I.

Dashing Armand. Black and white ticked English setter dog, 1yr. old (A.K.R. 585), by Dr. R. T. Tull, Elkton, Md., to Mr. Wm. Tallman, South Attleboro, Mass.

Dashing Prim. Orange and white English setter dog, 1yr. old (A.K.R. 586), by Dr. R. F. Tull, Elkton, Md., to Mr. Wm. Tallman, South Attleboro, Mass.

Gypsy Belle. Black, white and tan English setter bitch, age not given (Gladstone—Pearl), by Mr. F. J. Kinney to Mr. Wm. Tallman, South Attleboro, Mass.

Pride. Liver and white pointer dog, 2yrs. old (Croxteth—Royal Fan), by Mr. Wm. Tallman, South Attleboro, Mass., to Mr. F. Tiernan, Fort Scott, Kan.

Monarch S. Orange and white English setter dog, whelped Oct. 29, 1883 (Foreman—Jennie), by Mr. Wm. Tallman, South Attleboro, Mass., to Mr. J. K. Smith, Waterbury, Ct.

Foreman II. Black and white English setter dog, whelped Oct. 29, 1883 (Foreman—Jennie), by Mr. Wm. Tallman, South Attleboro, Mass., to Mr. N. Wallace, Waterbury, Ct.

Foreman—Jenny whelp. Black and white English setter bitch, whelped Oct. 29, 1883, by Mr. Wm. Tallman, South Attleboro, Mass., to Mr. N. Wallace, Waterbury, Ct.

Carl. Orange and white English setter dog, age not given (Waters's Grouse—Daisy Dale), by Mr. W. Thayer, Boston, Mass., to Mr. P. P. Lewis, New York.

Rifle and Trap Shooting.

FIXTURES.

June 2 to 9.—Annual Tournament Louisville Sportsmen's Association, Louisville, Ky. J. O. Barbour, Secretary, 157 Third avenue, Louisville.

RANGE AND GALLERY.

CREEDMOOR.

THE programme of the matches at Creedmoor during the present month include the following:

The Champion Marksman's Class Match, June 7 and 18.—Open to all members of the N. G. S. N. Y. (except as hereafter noted), and members of the National Rifle Association, the latter, however, not being eligible to win the principal prize; 200 and 500yds., five shots at each distance; the Remington Rifle (New York State model); standing at 200yds., lying head to target at 500yds.; entrance fee 50 cents, competitors allowed re-entries in each competition at the discretion of the executive officer, but only one score to count. Members of the N. G. S. N. Y., in uniform (jacket, cap and belt), may record their scores in this match as qualified for the New York State marksman's badge, provided that if ordered they have attended (or do once during the season attend) general practice, and provided they have previously qualified in the second class (100 and 300yds. See qualification match). First Prize—A gold marksman's badge for 1884. The badge to become the property of the competitor who, at the close of the season of 1884, shall have won it the greatest number of times. Ten other prizes (medals) presented by the National Rifle Association to the ten highest competitors in order of merit. Winners with a score of 39 points and over to receive a silver, and winners having a score of under 36 to receive a bronze medal. The same man can only win one medal during the season. In case of a tie the highest aggregate score of all the competitions participated in up to that time to decide. Winners of champion marksman's badges for the years 1876, 1877, 1878, 1879, 1880, 1881, 1882 and 1883, namely, Messrs. A. B. Van Heusen, William Robertson, James L. Price, W. J. Underwood, Jr., Thomas J. Dolan, H. T. Lockwood and G. W. Munson, winner of the gold marksman's badge for 1883, are not eligible to win the principal prize in this match.

The Qualification Match of 1884, June 7 and 18.—Open to members N. G. S. N. Y., and N. R. A.; the former being in uniform (jacket, cap and belt) may count scores made as qualifying them to shoot for New York State marksman's badge, provided that they use the State Remington rifle; 200 and 300yds., standing at 100 kneeling at 300yds.; five shots at each distance with any military rifle, special military rifles excepted; entries 50 cents each; re-entries permitted at the discretion of the executive officer, but only the highest score to count; to the competitors in each competition making the five highest aggregate scores, sixty per cent of the entrance money will be equally divided. On the days which the Q. and M. C. B. matches are to be shot the sale of entries will close at 5 P. M., and no shooting will be allowed after 5:30 P. M.

Any Rifle Long Range Match, June 14.—For any rifle within the rules. Distance, 900 and 1,000yds.; 20 shots at 900yds. and 25 shots at 1,000yds.; entrance fee, $1; time limit, 2½ minutes to each shot; prize, a bronze medal of the National Rifle Association, value $25; to be won by the competitor making the highest aggregate score in three matches; match to commence at 3 P. M. Pool open at 900yds. from 1 to 2:55 P. M.

Off-Hand Match, June 25.—All-Comers' match, distance 200 and 300yds., 7 shots at each distance, any rifle; entrance fee, 50 cents to members of the National Rifle Association, to others the fee will be $1. Prizes to the value of at least $50 will be given at each match. The prizes are in duplicate sets: one set for the five best scores made with military rifles, and one set for the five best scores made with rifles not military. The fishing tackle prize in the off-hand matches have been kindly donated for competition by Messrs. Abbey & Imbrie, No. 48 Maiden lane.

Military Rifle Long Range Match, June 28.—Open to military rifles only; distance, 600, 800, 900 and 1,000 yards; 10 shots at each distance; entrance fee, $1. Prizes: First, a Remington M. B. L. rifle complete with 250 rounds ammunition, to be won by the competitor making the highest aggregate score in any three matches. Five matches to be shot during the season, and four prizes in each match, as follows: To the four competitors making the best scores on each day $25, to be divided in order of merit—to first, $10; second, $7; third, $5; fourth, $3. Time limit, 2½ minutes for each shot. Match open at 11 A. M. Pool open at 600 and 800yds. from 9:30 to 10:50.

CALIFORNIA RIFLE ASSOCIATION.

SAN FRANCISCO, May 12.—The spring meeting of the California Rifle Association was held yesterday at Shell Mound Park, Berkeley. The weather was clear, and as a result the shooting was good. Following are the complete scores:

Directors' Match, 200yds.

S I Kellogg, Jr.	4555554—33	L R Townsend	3444444—29

MANCHESTER, N. H., May 24.—The wind blew strong from northwest this afternoon, and for a time offered an effectual barrier to the riflemen, who assembled at the West Manchester range, preventing them from raising their records of the three days' meet. Towards evening, however, the wind blew less fiercely, and Messrs. Dodge, Palmer, Leighton and Angell improved their records in the Creedmoor prize match, the first named using a Maynard 32-caliber, new style cartridge, making the magnificent string of 49 out of a possible 50, and taking the lead in this event over all competitors who have participated in it since the match opened six weeks since. Mr. Bixby

is second with 48 to his credit. Messrs. Palmer, Leighton and Drake have made 46 each, Mr. Potter has 45 and there are a large number tied on 44. The best scores made to-day are given below:

Creedmoor Practice Match.—J. Fuller 27 and 26, F. H. Waring 23.

Creedmoor Prize Match.—A. B. Dodge 47 and 49, C. D. Palmer 44 and 46, G. A. Leighton 44 and 46, A. R. Angell 42 and 44, J. A. Baker 43 and 43, B. Cline 42 and 43, C. M. Henry 40 and 43, John Lawrence 43 and 43, James Fuller 35 and 35, J. S. Cole 33.

BOSTON, May 31.—The third and last day of the spring meeting at Walnut Hill brought the largest attendance of the week. A strong baffling wind gave considerable trouble throughout the day, and but little improvement was made in the records over those of the two previous days. The prize winners with their three highest scores are appended:

Creedmoor Match.

WALTHAM, Mass., May 31.—The Hillside Rifle Club, of Waltham, at its weekly shoot to-day, made the following scores out of a possible 50: Creedmoor practice, off-hand—L. O. Dennison 45, E. A. Emerson 44, H. L. Whiting 43, G. W. Bassett 43, Frank Dunlap 42, W. A. Coughey 42, W. H. Stone 42. J. F. Williams 42, J. K. Lowe 41, W. Mitchell 38, E. F. Webster 33. Creedmoor rest match—J. R. Monroe 49, L. O. Dennison 49, W. H. Stone 46, W. A. Coughey 45, W. W. Green 45, H. L. Whiting 44, G. W. Bassett 44, C. H. Gray 44, J. K. Lowe 43, G. W. Strickland 42, W. Mitchell 40, E. F. Webster 41.

BULLSHEAD RIFLE CLUB.—Thursday, May 22, 12-ring target, possible 120: G. Zimmermann 118, C. Rein 115, B. Walter 88, D. Loutzki 97, H. A. Wasmuth 97, J. Shaw 102. Thursday, May 29.—G. Zimmerman 116, C. Rein 113, J. Schrarder 112, J. Campbell 101, J. Jordan 102, D. Loutzki 104, S. F. C. Weber 95, J. Shaw 102, G. Wettzie 102.—A. LOBER, Secretary.

THOMASTON, Conn., June 2.—The shoot on Saturday last was held with a tricky ten o'clock wind blowing across the range, the result being low scores. W. H. Dunbar won the badge with a score of 99: C. L. Alling 95, E. Thomas 94, C. F. Williams 93, G. A. Lemmon 91, F. Carr 85. A. Fox 83, G. P. North 81, B. W. Pease 73, Barlow 68.—F. A. PERKINS.

NEWARK, N. J., May 30.—William Hayes, of this city, Henry Oehl and M. Dorrler, of New York, and George Joiner, of Brooklyn, shot a match at Schuetzen Park to-day, 200yds., 100 shots each, any rifle. Oehl won the contest, making 2,207 out of a possible 2,500, distance 200yds. Dorrler scored 2,163. Hayes 2,130, and Joiner 2,076. Oehl used a Brown's breechloader of .38cal.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

THE CLAY-PIGEON TOURNAMENT.

Editor Forest and Stream:

The long talked of clay-pigeon tournament has passed into the category of the have beens. And it will be long remembered by those who participated as a most successfully conducted affair. The attendance was such as to make the gathering fairly national in its character, and the prizes are pretty well distributed over the country.

Owing to the absence of one of the Chicago shooters, the championship match was postponed from the first day to the second, and the first sweepstakes were substituted. There were 56 entries, 5 clays each, 15yds. rise:

O. B. Still, W. S. Perry, Fred Kimball, Geo. Williams, J. O. Jenkins and H. S. Taylor tied on five straight birds, and divided first money.

C. A. Calhoun and F. Drake tied on four birds and divided second money.

Geo. Wilson, M. E. Taber, G. S. Sampson, D. C. Powers and Abe Kleinman tied on three birds and divided third money.

Second match, sweepstakes. 74 entries, 7 clays, 18yds., J. A. Prechtel, of Cleveland, O., took first; W. S. Perry, Worcester, Mass., second and F. Gastright, of Newport, Ky., and E. W. Wick, of Colorado, divided third. Following are the scores:

O B Still	0011000—2	Herman	1000100—2

Stark	10110—3	Beamis	10111—4
Prechtel	11101—4	Tucker	11110—4
Denman	01111—4		

First money divided by Abe Kleinman, Linneman, Bandle, J. Partington, McKevitt, Jones, Williams and Wilson. For second money; on the shoot-off thirteen men dropped out, leaving six, who drew out $15 each and shot for the balance. Third money was divided in the same way among four shooters.

A committee was appointed to draft a constitution for a National Sportsman's Association.

THE ONE BALL COMPLAINT.—*Editor Forest and Stream:* We notice an article in your last issue from "A. C. G.," Poughkeepsie, N. Y., trying to make a great stress on his experiments with our balls, and seeking to condemn them because they would not in every instance break with a single pellet of No. 8 shot at 40yds. We wonder why he did not try the same thing at 60yds. We think that "A. C. G." makes a display of his ignorance, and shows that his expectations are far greater than his realizations when he thinks a target of any kind yet produced should break into atoms with a single pellet of No. 8 shot at 40yds. We know that our balls can easily be broken by a single pellet of No. 8 shot at a reasonable distance, and the representative trap-shooters of Western New York, from Syracuse to Buffalo, whose names appear in this issue and scores show that the balls are all we advertise and more. We will gladly furnish the address of any or all of these gentlemen, that are not beginners in the shooting art, and leave the verdict in their hands regarding the superiority of our target balls. This learned gentleman from Poughkeepsie should take the kind advice of the editor of this paper and learn to load a gun, and then learn to shoot it, or else get up the target alluded to "that will break automatically whenever a gun is pointed at it." Capt. Bogardus and sons, with the Buffalo Bill Wild West; Capt. E. E. Stubbs, of Gainesville, Kan.; Messrs. Butler and Oakley, "premier shots," with Sell's circus, and many others of professional fame, use our balls exclusively for their ball shooting, and that glass must go is a certainty. To kill birds in the field, to kill them from the trap, to break clay-pigeons or ball pigeons or target balls of any kind with a single pellet of shot is unreasonable, to put it in its mildest form.—F. J. MOYER (Secretary Target Ball and Ball Pigeon Co., Lockport, N. Y.).

LOCKPORT, N. Y., May 25.—Second match of a series of twelve under the management of the Target Ball and Pigeon Company. The shooting was by far the finest the city has ever seen, quite a number of noted marksmen from different parts of the State participating. The first contest was for 10 target balls, rotary trap: Geo. Luther 8, E. Smith 8, J. Andrews 10, H. Howard 6, H. Whitney 10, J. H. Jewett 6, E. M. Moody 9, Dr. Moyer 9, John Pierce 7, R. G. Woods 9. Andrew and Whitney divided first money, Moody and Moyer second money, Luther and Smith third money.

The second contest was for 10 ball pigeons: Luther 9, Smith 8, Andrews 7, Howard 10, Whitney 10, Jewett 7, E. Moody 10, Moyer 9, G. Moody 9, Pierce 8, Woods 7, Coombs 5, Isbester 10, Freeman 7. E. Moody took first money in shooting off. Dr. Moyer and G. Moody divided second money, Smith and Pierce divided third money, Andrews and Jewett fourth money.

The third contest was for 15 ball pigeons: Luther 14, Smith 13, Andrews 11, Howard 13, Whitney 14, E. Moody 12, Moyer 15, G. Moody 15, Pierce 14, Jewett 12. Dr. Moyer and Geo. Moody divided first money, Luther and Whitney divided second money. Smith and Howard third money, E. Moody and Jewett fourth money.

The fourth contest was for the championship ball pigeon badge of 20 pigeons divided into 2 sweeps: Smith 20, Andrews 17, Whitney 20, E. Moody 18, G. Moody 16, Woods 4, Luther 16, Freeman 16, Jewett 17, Howard 16. Pierce 16, Moyer 19. In shooting for the badge, Whitney won, taking first money and champion badge, Dr. Moyer took second money.

The fifth contest was a double rise, 5 balls and 5 pigeons: Andrews 9, Smith 8, Whitney 10, Jewett 6, Pierce 10, E. Moody 10, Howard 8, Luther 9, Moyer 9. In shooting off Whitney won first money, Andrews and Moyer divided second money, Smitu and Howard divided third money, Jewett won fourth in shooting off.

The sixth contest was 10 balls from a ball pigeon trap; Whitney, Smith and G. Moody 10, Pierce 6, Andrews 9, E. Moody 9, Coombs 9, Isbester 8, Moyer 9, Luther 8, Howard 8. In shooting off Whitney took first money, Moyer and Andrews divided second money, Howard third money, and Pierce took fourth money.

SYRACUSE, May 29.—In a shooting contest at the Syracuse Driving Park this afternoon, sweepstake prizes were competed for. Following is the score in the first shoot at 10 glass balls: Morehouse 10, D. Walters 7, C. Walters 9, G. West 8, Emmett 7, Remer 4, Courtney 8, Chapman 7. Morehouse took first money. C. Walters second. In shooting off ties on eight, Courtney beat G. West, taking third money. The second contest resulted: Morehouse 8, D. Walters 8, C. Walters 8, Emmet 8, G. West 7, Chapman 6, Courtney 8. In shooting off the ties on eight Courtney and C. Walters tied on four and divided first money. Emmett made a count of three, taking second money. Morehouse and G. West broke two each. The third shoot resulted: Wilkins 2, G. West 5, Morehouse 2, C. Walters 4, D. Walters 4. A grand glass ball and clay-pigeon tournament is advertised to be given at the Syracuse Driving Park, on June 4 and 5, under the auspices of the Onondaga Sportsman's Club. Two hundred dollars in prizes is guaranteed. Special prizes for proficiency are offered by Messrs. Lodder, Prettie and Dugard.

MILFORD GUN CLUB.—This club reorganized this week, taking in four new members. Our club is now composed of practical sportsmen. We have a Card's and also a Davenport combination trap for clay-pigeons. Will practice weekly and will respond to all challenges. On Friday, June 6, the club will meet the Schenevus Gun Club for a friendly contest. Other neighboring clubs are invited to confer with us as to future contests. Address either L. E. Sexton, Sec., or Chas. Armstrong, Pres.

PUBLISHER'S DEPARTMENT.

THE BILLIARD BALLS manufactured by F. Grote & Co., 114 East Fourteenth street, this city, are the most perfect made. The firm does an immense business.—*Adv.*

EVERYBODY wants to know the news. The latest is that Esterbrook is still making those delightfully easy writing and reliable pens that are so popular everywhere.—*Adv.*

Yachting.

FIXTURES.

Secretaries of yacht clubs will please send early notice of proposed matches and meetings.

June 7.—Larchmont Y. C., Pennant Match.
June 9—Portland Y.C., Challenge Cup.
June 9.—Savannah Y. C., Opening Cruise.
June 10.—Atlantic Y. C., Annual Match.
June 11.—Hudson River Y. C., Annual Match.
June 12.—New York Y. C., Annual Matches.
June 14.—Seawanhaka Corinthian Y. C., Annual Match.
June 16.—Newark Y. C., Opening Match.
June 16.—New York Y. C., Race around Long Island.
June 17.—Quaker City Y. C., Review and Harbor Cruise.
June 19—New Jersey Y. C., Annual Match.
June 21.—Hull Y. C., Pennant Match.
June 23.—Newark Y. C., Open Matches.
June 24.—New Haven Y. C., Spring Match.
June 26.—Salem Bay Y. C., First Championship Match.
June 27.—Eastern Y. C., Annual Matches.
June 28.—Boston Y. C., Ladies' Day.
June 30.—Manhattan Y. C., Annual Cruise.
June 30.—Quincy Y. C., Second Match.
July 4.—Larchmont Y. C., Annual Open Matches.
July 4, 5, 6.—Quaker City Y. C., Corinthian Cruise.
July 5.—Hull Y. C., Review and Annual Cruise, five days.
July 9.—Beverly Y. C., Marblehead, First Championship.
July 12.—Boston Y. C., Second Club Match.
July 12.—Hull Y. C., First Club Match.
July 19.—Hull Y. C., Ladies' Day.
July 24.—Eastern Y. C., Annual Cruise.
July 26.—Beverly Y. C., Nahant, Second Championship Match.
July 30.—Quincy Y. C., Third Match.
Aug. 4.—Quaker City Y. C., Review and Harbor Cruise.
Aug. 9.—Boston Y. C., Annual Matches.
Aug. 11-25.—Quaker City Y. C., Annual Cruise in Chesapeake and Delaware Bays.
Aug. 16.—Salem Bay Y. C., Open Matches.
Aug. 16.—Hull Y. C., Open Matches.
Aug 28.—Quincy Y. C., Fourth Match.
Aug. 30.—Hull Y. C., Second Championship Match.
Sept. 3.—Hull Y. C., Third Championship Match.
Sept. 4.—Salem Bay Y. C., Second Championship Match.
Sept. 13.—Boston Y. C., Fall Matches.
Sept. 14.—Quaker City Y. C., Review and Cup Race.
Sept. 28.—Quaker City Y. C., Review and Harbor Cruise.
Oct. 5.—Quaker City Y. C., Closing Review and Cruise.

KNICKERBOCKER Y. C.

THE spring matches of the Knickerbocker Y. C. were sailed on Friday, May 30, the course, except for the smaller boats, being around the Gangway buoy.

Forty-four of the seventy-six entries were ready at the starting line at 11:30 A. M. The yachts were divided into eight classes. The wind was fresh from the southwest at the start, and there was enough all day to make the races interesting, besides some heavy squalls that came in, which disabled several of the boats, the Amazon losing her topmast, Lizzie R. springing her mast below deck and finally losing it, and Nettie Thorp splitting her mainsail.

The times of the first ten boats at the Gangway buoy were: Lizzie R. 1:41:02, Gracie 1:42:10, Rosetta A. 1:44:00, Adele 1:44:10, Daisy 1:44:50, Nellie R. 1:46:30, Susie A. 1:46:35, Corinne K. 1:47:00, Nettie Thorp 1:51:28, Narrioch 1:52:50.

The run home with a free wind to Fort Schuyler, was followed by a beat up against the ebb tide, the finish being made at 4:30. The times of the yachts were as follows, the winners in the first and second class not being known, as they have not yet been measured under the new sail area and length rule.

	Start.	Finish.	Elapsed.	Corrected.
Wacondah	11 32 53	4 40 39	5 07 46	
Undine	11 32 34	4 22 31	4 49 59

The iron steamer Sirius accompanied the yachts and carried a large number of guests.

SEAWANHAKA CORINTHIAN Y. C.

THE opening day of the Seawanhaka Y. C. proved to be anything but a "cutter day," as the term is usually applied, at least so far as weather is concerned. The light southerly wind proved just sufficient to carry all the boats out into the strength of the tide, after which it left them at intervals to anchor or drift back as they saw fit.

Bedouin was detained at Newburgh, where she passed the winter and fitted out, so Commodore Rogers transferred his flag to the Ossabair, better known as "No. 100," from which orders were given for a start, after which he went aboard the schooner Nokomis.

Starting at 11:15, the schooners Wanderer and Ray; cutters Wenonah, Ileen and Oriva; sloops Mischief, Fanny, Sagitta and Kelpie, and the little yawl Aneto, passed down between the club house and the Nokomis, dipping their colors as they passed. Ileen and Wenonah, working down out the tide, caught a breeze which carried them on down the Bay, and finally around the Scotland light, the course ordered for the entire fleet; but the others, less fortunate, drifted about the Lower Bay until all idea of going over the course was abandoned, and Vice-Commodore Tompkins signalled to return. Coming home there was rather more wind, and the fleet came to anchor off the club house at 5:30.

The fourteenth Corinthian race of the club will be sailed on Saturday June 14, and will be open to the second class schooners, first, second, third and fourth class sloops and cutters, of the Seawanhaka, New York, Atlantic, Larchmont, Eastern, and New Bedford yacht clubs, under the sailing regulations of the Seawanhaka Corinthian Y. C.

The following prizes are offered, besides personal prizes to members of the winning crews:

Schooners—Second class, under 85ft. corrected length; value of prize $150.

Cabin Sloops and Cutter: First class, 55ft. corrected length and over, $150; second class, 45ft. corrected length and under 55ft., $125; third class, 35ft. corrected length and under 45ft., $100; fourth class, under 35ft., $100.

Entries.—Entries must be made in writing, and filed with the chairman of the sailing committee, Louis P. Bayard, 167 Broadway, by 3 o'clock P. M., on June 12, accompanied by the measurement of the yacht entered, according to S. C. Y. C rules, certified to by the measurer of the club from which she enters or by her owner, together with a list of the proposed crew, their several occupations and address. Blank forms of entry with the club rules for measurement will be furnished by the secretary, on application.

Yachts may carry as crew, besides the helmsman, one man for every five feet or fraction thereof of length on deck, but must be manned exclusively by amateurs, except on schooners and first-class sloops and cutters, on which members of the regular crew, to the number of five on schooners and four on sloops and cutters, will be allowed. Their names must appear in the entry, and be subject to the approval of the Sailing Committee.

The following sails may be carried: Schooners—Mainsail, foresail, forestaysail, jib, flying jib, jibtopsail, fore and main ga topsails, main topmast staysail and spinaker. Sloops and Cutters—Mainsail, forestaysail, jib, flying jib, jibtopsail, gafftopsail and spinaker. Any of the above sails may be carried as balloon sails, gafftopsails excepted. Sloops and cutters of the fourth class may carry topsails extending above the truck.

The start will be a flying one, as near 11 A. M. as possible.

The course will be as follows:

Course—For schooners and first and second class sloops and cutters: from an imaginary line between the committee steamer and Fort Wadsworth, to buoy 10, on the S. W. Spit, keeping it on the port hand, thence to and around buoy 8½, keeping it on the port hand, thence to and around Sandy Hook Lightship, keeping it on the starboard hand, and return over the same course to buoy 15, keeping to the eastward of buoys 9, 11, 13 and 15, on the west bank, and outside of buoy 5, on the point of Sandy Hook, going and returning.

For third class sloops and cutters: from the same starting line, to buoy 10, on the S. W. Spit, keeping it on the port hand, thence to and around buoy 8½, keeping it on the port hand, thence to and around the Scotland Lightship, keeping it on the starboard hand, and return over the same course to buoy 15, keeping to the eastward of buoys 9, 11, 13 and 15 on the west bank, and outside of buoy 5 on the point of Sandy Hook, going and returning.

For fourth class sloops and cutters: from the same starting line to buoy 10, on the S. W. Spit, keeping it on the port hand, thence to and around buoy 8½, keeping it on the port hand, thence to and around buoy 5 on the point of Sandy Hook, keeping it on the starboard hand, and return over the same course to buoy 15, keeping to the eastward of buoys 9, 11, 13 and 15 on the west bank, going and returning.

The finish must be made across an imaginary line between the committee steamer or station boat, and buoy 15.

The management of the races will be in the hands of the Sailing Committee: Louis P. Bayard, 167 Broadway; Francis O. de Luze, Walter L. Suydam, Alexander H. Stevens, S. Nelson White.

Copies of the rules and blank forms of entry may be had of the secretary, Mr. L. F. D'Oremieulx, No. 67 Exchange Place.

ATLANTIC Y. C. OPENING CRUISE.

THE Atlantic Y. C. opened the season with a sail down the Bay on Decoration Day, in which nearly forty yachts took part. In accordance with the programme, the fleet formed in two lines off the club house at 11 A. M., the offshore line, in which were the schooners and larger sloops, having the Enterprise, Vice-Commodore Moffat at the right, while Rear-Commodore Wintringham, in his new sloop Nomad, was on the right of the inner line of smaller sloops.

In the matter of wind the Atlantic was rather more fortunate than its neighbor across the Bay, as the boats were able to get over the course, though the light and variable winds prevented anything like a test of the boats. The schooners present were the Agnes, Montauk, Crusader, Varuna, Republic, Triton, Grayling, Haze, Leona and Tioga. The sloops were the new Athlon, Vertie and Nomad, the Thistle (lately rebuilt), Gracie, Mistral, Enterprise, Roamer, Truant, Parole, Fanita, Viola, Stella, Crocodile, Penguin, Kaiser, Venture, Ildeun, Pilot, Hilda, Lois, Amelia, Nita, Elephant, Daisy, Viking, Romeyn and Nancy C.

A gun was fired from the flagship at 11:30, and fifteen minutes later all were under way. The wind throughout the day was light and unsteady, and when Buoy 8½ was rounded the signal was given from the flagship to return, the yachts finding a little more wind toward the close of the day, all coming to anchor off the club house about 5 P. M.

LADIES' DAY, JUNE 2.

Nearly all the yachts that took part in the opening sail of Friday were ready again on Monday afternoon for the "Ladies Day" of the Atlantic Y. C. The boats of the various yachts and the little launch of the club were busy carrying visitors aboard; at 3:30 the first gun was fired, and ten minutes later a third gun gave the final signal, by which time most of the twenty-two boats in the race had crossed the line.

The course was from the Atlantic Basin to a stake boat, moored off Oyster Island up the Bay, thence to another stake boat off Tompkinsville, and home, a distance of nearly eight miles. The wind was light from the south, and with a good flood under them the yachts strung out in a line, the larger schooners leading the way over toward Bedloe's Island.

The first to turn was the Triton, at 4:00:08; followed by Grayling at 4:00:25; Agnes, 4:01:02; Thistle, 4:01:03; Athlon, 4:02:12. On the short beat to the second mark the wind freshened, and Grayling took the lead, rounding at 4:24:03; the Triton next at 4:25:10; Thistle at 4:25:25; Athlon, 4:26:38; followed by Roamer, Agnes, Crocodile, and Enterprise.

This order was maintained on the short run home, the time of the race being as follows:

	Elapsed.	Corrected
SCHOONERS—CLASS A.		
Grayling	0 59 15	0 59 15
SCHOONERS—CLASS B.		
Agnes	1 07 25	1 06 10
Triton	1 02 15	1 02 15
Leona	1 19 58	1 16 02
SLOOPS—CLASS C.		
Athlon	1 04 15	1 04 15
Thistle	1 03 57	1 03 57
SLOOPS—CLASS D.		
Viola	1 05 03	1 04 10
Roamer	1 00 45	1 00 45
Enterprise	1 02 50	1 02 00
SLOOPS—CLASS E.		
Kaiser	1 12 45	1 12 38
Mistral	1 16 40	1 15 07
Elephant	1 06 14	1 04 01
Crocodile	1 04 51	1 04 51
Amelia	1 22 10	1 21 41
SLOOPS—CLASS F.		
Tourist	1 14 40	1 13 38
Daisy	1 09 32	1 09 32
Viking	1 10 15	1 10 07
Nomad	1 16 56	1 16 39
Romeyn	1 08 18	1 08 03
SLOOPS—CLASS G.		
Venture	1 21 43	1 21 43
CAT RIGS—CLASS H.		
Wanda	1 35 00	1 35 00
Hypatia	1 21 00	1 21 00

After the return an entertainment to the guests of the club was given at the club house. The annual matches of the club will be held on June 10.

ANOTHER BLOW AT THE SANDBAGGERS.

A FEW weeks since we noted the action of the Knickerbocker Y. C. in the adoption of the sail area and length rule, and in limiting the crews to one man to every 3ft. of deck length, both of which steps tend to the exclusion of the sandbaggers, and now the New Jersey Y. C., as will be seen from the following letter, put themselves squarely on record as opposed to shifting ballast and unlimited crews, the reasons for which are clearly given below.

If the clubs interested will but try the experiment of limiting their crews and prohibiting shifting ballast, there is no reason why New York should be so far behind in small boat racing. It is certain that this kind of yachting is at the lowest ebb here, and equally certain that it cannot be revived as it is at present conducted, and the sooner the unsafe, oversparred sandbagger disappears from our waters, the better for true yachting.

The influence of the sandbag boat on our yacht models has retarded yachting about a dozen years in this country, and though it is now at an end and virtually dead as far as large yachts are concerned, its evil effects will be felt for some time. We have the men and the money to promote small safe yachts, and for every trap that disappears from the races we may expect in a few years half a dozen trim little ships, safe, speedy and roomy, with a crew of sailors to man them. The New Jersey Y. C. deserve all praise for the step they have taken. Who will be first to follow them?

NEW YORK, May 6, 1884.

Messrs. Frank McCown and C. W. Boughton, Committee:

GENTLEMEN—Your communication relating to a union regatta during the coming summer was submitted at a meeting of our club on Thursday evening, 24th ultimo. After considerable discussion relative to the matter, a committee was appointed to ascertain the facts as far as possible, and to state the condition upon which our club would co-operate.

It may not be unknown to you that the New Jersey Y. C. is by its constitution and by-laws confined to stationary ballast, and a limited crew for the first regatta of each year; and it is a fact that no race or regatta has ever been authorized by the club during its existence of thirteen years except with fixed ballast and limited crews. As a consequence, but few of our boats have large sails and spars such as are necessary to secure success in a race where shifting ballast and unlimited crews are allowed. Furthermore, a very large proportion of our members are imbued with the idea that our sailing rules are more in accordance with the advanced ideas of yachting, and better calculated to develop a genuine love for the sport among men of all classes and conditions of life, than the old-fogy notions that have prevailed for the last fifty years with owners of small yachts.

It is apparent to every thoughtful mind that such a system has ceased to have any great amount of vitality. The strongest evidence of this was manifested last year in the effort made to bring small boats together.

In the race for 20ft. boats, only three started, notwithstanding the immense amount of effort made; and in the race for 27ft. boats, but six could be gotten together, while in Eastern waters, where fixed ballast is the rule, no less than two hundred boats started in a single race, and we rarely hear a Union regatta in the vicinity of Boston with a less number than fifty participating. Why is such the case? Is it because we lack means, courage, seamanship or water facilities? No, nothing of the kind. We have them all; and when sailing regulations similar to those adopted by the New Jersey Y. C. become the rule and not the exception, there will be no difficulty in bringing together in the bay of New York, a fleet of boats equal in every respect to that of any other city in the world.

The New Jersey Y. C. has made an effort in that direction during the past two seasons, by giving open regattas in the fall, with only partial success, due to the fact that most of the clubs for small boats within convenient distance sail their races with shifting ballast and no limitation as to crews.

The reason generally urged against stationary ballast is the danger of sinking in the event of a cap-size. It's an old saying, "to be forewarned is to be forearmed," and our members fully appreciating this adage, have provided their boats with galvanized air tanks, sufficient to buoy the greater part of the dead weight, thereby rendering them safer than sandbag ballast without air tanks.

To capsize is a possible event; yet such an occurrence has not happened in our races with stationary ballast in six years, and never have we lost a life in consequence, while no less than three boats out of the six starting in the shifting ballast sweepstakes race of last summer were turned over, and a fourth carried away the mast.

In this communication, so far we have presumed that your efforts would be directed toward a regular old-fashioned sandbag race. It may be that in this we are mistaken, and that in the Oceanic Y. C. we are to have an ally in our struggle for fixed ballast and limited crews. If so most cordially will we extend a welcome, and you will find us ever ready and willing to co-operate with you in any effort you may make in that direction.

To be perfectly candid, we have given much consideration to this communication, in the hope that we might induce you to co-operate with us—if not at present—at least in the near future.

In conclusion we must say, that under no circumstances could we be induced—as a club—to act in concert with you, in the interests of a Union Regatta that permits shifting weight and unlimited crews.

Very respectfully,

WM. H. DILWORTH, } Com'ts
ED. A. STEVENS, } N. J. Y. C.

SOUTH BOSTON Y. C. SPRING MATCHES.

THE cold weather of last week had ended by Friday morning in a brisk northwest wind, which, though acceptable to the yachtsmen, had sufficient frost in it to make the opening match of the South Boston Yacht Club anything but summer sailing.

The flagship of the South Boston Y. C., the North Star, was moored off City Point, to do duty as judges' boat, the course being, for the first class, from the judges' boat, leaving on the starboard hand Thompson's Island, Rainsford's Island, and Toddy Rock buoy; Long and George Islands and Point Allerton buoy to port; and on the return, leaving Toddy Rock, Fort Warren, Gallop Island, bell buoy, Long and Spectacle Islands also to port, finishing abreast the judges' boat, making fourteen miles.

The second, third, and special classes were to leave Cow Pasture buoy to port, buoy No. 7 to starboard, leaving Sculpin Ledge buoy to port, buoy No. 6, lower middle, and buoy No. 9, upper middle, also to port, and finishing at start. Distance nine miles. The fourth class were to leave to port, Cow Pasture buoy No. 6, Fort Independence buoy No. 7, and buoy No. 9, upper middle, finishing at start. Distance six miles.

The yachts were signaled at 1:45 to take positions, and soon formed in three lines.

The first and second classes were started at 2:10, the third and special classes at 2:15, and the fourth at 2:20. To avoid any mistake in timing the 68 yachts starting, each was provided with a card bearing the number assigned to her, which card was displayed on passing the judges' boat.

Over the first part of the course the big fellows carried spinnakers and balloonsails. But few mishaps occurred, the most serious being off Sculpin Ledge Buoy, where Niobe fouled Parole, and stove a small hole in her quarter, giving occasion for a protest. The times of the 38 yachts that finished are:

	Length.	Corrected.
FIRST CLASS (CENTERBOARDS).		
Clytie, F. Cunningham, Eastern	34 08½	2 37 24
Magic, E. C. Neal, Lynn	31.10	2 19 37

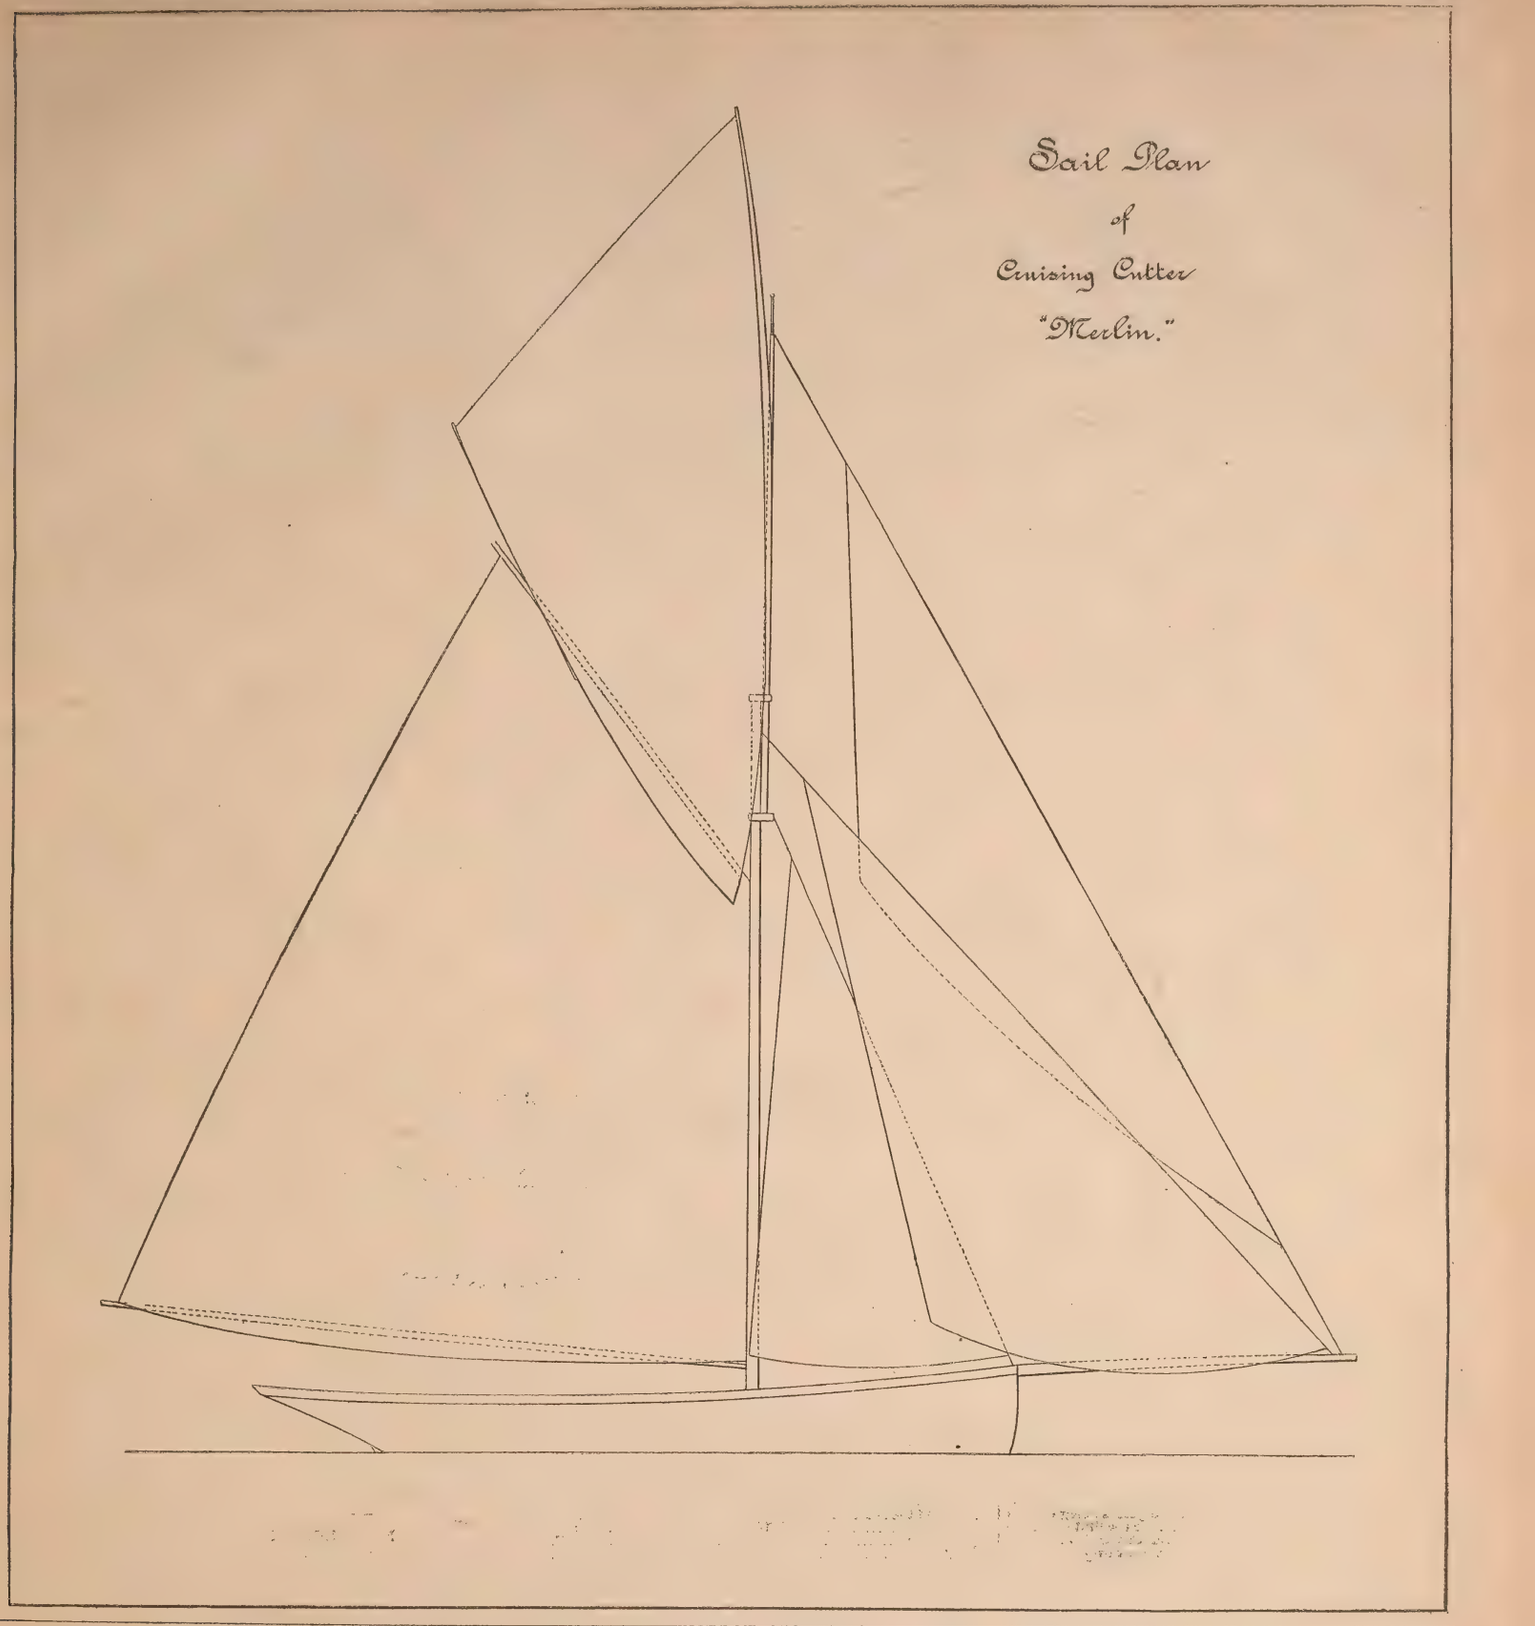
Following is a list of winners and prizes:

First class: Centerboards—First prize, $25, Magic; second prize, $10, Shadow. Keels—First, $25, Lillie second, $10, Ægir.

Second class: Keels—First, $20, Kitty; second, $10, Zulu. Centerboards—First, $20, Lizzie Warner; second, $10, Greta.



Third class—First prize, $15, Thisbie; second, $10, Spray; third, $5, Pet.

Fourth class—First, $10, Flora Lee; second, $7, Whiff, third, $5, Nancy.

Special keel class—First, $15, Vesper; second, $5, Belle.

After the races the skippers of the competing boats and a number of invited guests were entertained by Com. Hussey on board the North Star.

The Regatta Committee in charge of the races were John Bertram, C. McKenna, J. E Chandler, H J. McKee, F. G. Cooley, R V. King and S. A Crowell. The judges were E. G. Robinson, W. Hutchinson, G. Conant, T. Christian and William Morris.

THE MERLIN.

WE give this week the sail plan of the Merlin, 5 tons, the drawings of which appeared in the previous issue. The mainsail, though shown with a loose foot, is laced to the boom. The sail area is about 760ft., and not as given last week:

Mast from fore side of stem	10ft.
Mast deck to hounds	23ft.
Mast diameter at deck	6in.
Topmast, fid to sheave	19ft. 6in.
Boom	26ft.
Gaff	17ft.
Bowsprit outboard	13ft.
Masthead	5ft.
Angle of gaff	51°
Area lower sail	760sq. ft.
Center of effort forward of C.L.R.	6in.

Mainsail—Foot, 25ft. 3in.; luff, 19ft.; head 16ft. 6in.; leach, 33ft. 4in.; tack to peak, 33ft. 6in.; clew to throat, 30ft.
Jib—Foot, 15ft. 10in.; luff, 30ft. 8in.; leach, 22ft. 3in.
Staysail—Foot, 10ft. 4in.; luff, 21ft. 6in.; leach, 19ft. 8in.
Topsail yard, 23ft.

LARCHMONT Y. C.

THE first pennant matches of the season will take place on Saturday, June 7, over the club course. Commodore Munroe offers a special prize of the value of fifty dollars to the first yacht in each class in which are four starters. These prizes, which will be of silver, are to be held by the winners, and are not subject to challenge. Notices of entries must be given to the Regatta Committee at the club house by Saturday morning, and all yachts must procure numbers, which must be carried on the sail. The race will start at 10:45 A. M. The races will be sailed under the following rules: The Regatta Committee are Messrs. Chas. E. Jenkins, T. B. Brown and Capt. J. B. Miley.

Pennant regattas shall be held in June and September of each year, on a day to be fixed by the regatta committee.

Each yacht enrolled in the club shall be considered as entered for these races.

There shall be a challenge pennant awarded to the winning yacht in each class. To be held by such yacht for the rest of the season unless challenged therefore, as hereinafter provided. If, in any class only one yacht comes to the starting line, she shall be entitled to the pennant of her class.

Any yacht winning the pennant in her class, shall be entitled to hold the same for thirty days from the date of the race in which the same was awarded to her; after which time she may be challenged by any yacht of her class as follows:

The owner of any yacht desiring to challenge the yacht holding the pennant in the same class shall give a written notice to the owner of such yacht, and shall serve upon the commodore and corresponding secretary a copy of such notice. The commodore shall thereupon appoint a time for the race, not earlier than one week nor later than two weeks thereafter, and shall inform the corresponding secretary, who shall thereupon notify all the members of the club.

Any yacht of the same class may compete for the pennant by filing with the regatta committee an entry in writing, in the manner provided in the sailing rules and regulations of the club.

If at any time, from any cause, the pennant of any class shall be in the possession of the club, any yacht of such class may challenge for it by serving a written challenge on the commodore and corresponding secretary. The corresponding secretary shall thereupon notify all the respective owners of the yachts of that class that such challenge has been filed. In case no yacht of that class shall within ten days thereafter file an entry with the commodore or corresponding secretary for such pennant race, the commodore shall award the pennant to the challenging yacht, and give notice of such award at next meeting of the club. If one or more yachts enter, the commodore shall appoint a time for the race and the corresponding secretary shall notify all the members of the club.

The challenge pennants shall remain the property of the club, and shall not belong to the owners of the yachts winning the same, and in case any yacht holding a pennant shall cease to be enrolled in the club, the pennant shall be returned to the club.

Start: First Gun—For all yachts to approach the starting line. Second Gun—Five minutes after the first, for all classes to start, both open and cabin yachts. Flag signal on Pagoda will be lowered. Third Gun—Five minutes will be allowed to cross the line after the signal for the start, when a third gun will be fired. Flag signal on Pagoda raised. Any yacht that does not cross the starting line within the time allowed is timed from the firing of the third gun. It is particularly requested that prompt notice of intention to race be given to the Regatta Committee, Club House, Larchmont.

"VACATION CRUISING."—Just at this time, a most important question to many is "Where shall I spend my vacation?" The problem being with some how to condense the most amusement into a limited time at some fashionable resort; but with a large and constantly increasing number it takes the form of how to spend the allotted time so as to obtain the greatest amount of mental rest, healthy exercise and recreation at a reasonable cost. Among the latter is to be counted Dr. J. F. Rothrock, writer of "Vacation Cruising in Chesapeake and Delaware Bays," a book we can recommend to all who have a liking for out-door life about the water, and especially to novices in cruising and camping, to whom Chapter V, "Who Should go Cruising," as well as who should not go, is specially directed. The writer, taking Herbert Spencer for his text, preaches like him the "gospel of relaxation," and at the same time tells the story of three months knocking about in a small yacht in a way that is attractive and interesting. Dr. Rothrock is an earnest advocate of safe boats, and while a light draft was absolutely necessary for his work, he is a believer in depth, low weights, and those good qualities that FOREST AND STREAM has so long insisted on, and writes strongly in favor of the yawl rig for cruising. The book will be of value as a guide to all who visit Chesapeake Bay, and also to those who, while not yachtsmen, are interested in the places visited.

NEWARK Y. C.—This club will hold a union regatta on Monday, June 16, over the club course in Newark Bay, there being six classes, as follows: Class A, cabin sloops; Class B, jib and mainsail 24ft. and over; Class C, jib and mainsail 20ft. and under 24ft.; Class D, jib and mainsail under 20ft.; Class E, catrigged over 19ft.; Class F, carrigged 19ft. and under. A prize of $20 will be given in each class. The entrance fee is $3. The judges are: Messrs. Oliver Adams, Larchmont Y. C.; J. W. Thorp, Harlem Y. C.; William M. Clarke, Newark Y. C. Boats may be left at the Bay Shore House before the races or after they are over. Entries should be addressed to Charles E. Cameron, Treasurer, 717 Broad street, Newark, N. J.

WINDWARD.—This little yawl, the first in Newport waters, arrived at Newport on May 28. She was built for Mr. Hugh L. Willoughby by W. P. Stephens, West Brighton, Staten Island, and is 18ft. on water line, 6ft. beam, 4ft. draft, 5ft. headroom in cabin; keel 1,700lbs., ballast inside 2,016lbs., lower sails 385sq. ft.

NEW JERSEY Y. C.—As a change from the customary sail down the Bay, the New Jersey Y. C. sailed up the Hudson on Decoration Day, taking dinner at Fort Lee, and returning in the evening.

NEW HAVEN Y. C. OPENING CRUISE.

THE new club house of the New Haven Y. C. was filled with guests on Friday, besides a large number of club members who were to take part in the opening sail. The course was from the club house to Luddington Rock buoy, leaving it to starboard, thence to and around the buoy off Charles Island, and back, making a course of twenty miles.

At 10:45 ten yachts started with a fresh northwest breeze: Starlight, L. D. Chidsey; Marguerite, Messrs. Peck and Sanford; Vixen, Messrs. Beecher and Seaman; Endeavor, Rear Com. H. D. Billard; Acruse, Com. C. W. Scranton; Ceres, T. D. Ranson; Ferguson, L. T. Ferguson; Zephyr, G. E. Dudley; Rival, W. W. Converse; Wild Duck, Alex Lutz.

Nearly all were reefed at starting. Though not a regular race, the contest was lively and exciting, the Ferguson coming in first at 2:43, and the Wild Duck 2min. later. The only accidents were the loss of a couple of topmasts. The club will hold a large reception at their new house on June 4.

WILLIAMSBURG Y. C.—The fourteenth annual regatta of the Williamsburg Yacht Club was sailed Monday, the course being from Pottery Beach to and around the Gangway buoy and finishing off Hunt's Dock. The judges were Daniel O'Brien, Daniel Lockwood and William Lyons. The General Sedgwick, her attractions tripled by the presence of two bands besides her well-known calliope, accompanied the yachts, carrying the guests of the club. Twenty-seven yachts had entered, but of these, only seventeen started out at noon. The wind was very light, but the strong flood tide carried them through the Gate and on into the Sound, where they still drifted on until near Whitestone a breeze from the south came to their help. The times of turning the Gangway buoy were:

Mary Keegan	3 55 40	Lizzie V	4 44 40
Carrie Van Voorhis	4 01 40	Susie B	4 48 33
Snoozer	4 08 35	Tidal Wave	4 50 45
Armenia J. Foster	4 22 33	Sorceress	4 51 54
Grace Darling	4 27 08	James Tregarthen	4 53 12
Bulldozer	4 37 00	Lancer	4 57 35
Samuel G. Free	4 40 48	Sally Ann T	5 01 00

The road home was to windward with a fresh breeze, the times of the boats being:

CLASS A—CABIN SLOOPS.

	Start.	Finish.	Elapsed.	Corrected.
C. Van Voorhis	11 59 50	5 44 32	5 44 42	5 44 42
Susie B	12 00 00	6 26 36	6 26 36	6 20 06

A. J. Foster	11 41 30	6 20 50	6 39 11	6 30 21
Narrioch	11 43 37	Did not turn gangway buoy.		
Bulldozer	11 41 00	6 23 38	6 42 48	6 38 08
Grace Darling	11 41 52	8 34 10	6 52 18	6 32 38

ARRIVAL OF THE VERVE.—The Allan steamship Corean brought over from Glasgow, on her upper deck, the famous cutter yacht Verve, which last year won nearly all of the races for ten tonners on the British coast, and has never lowered her racing flag in token of defeat. In future the Verve is destined to sail under the stars and stripes, she having been bought from Mr. Clark, of Paisley, her original owner, by Mr. A. W. Sawyer, a grain speculator of Chicago, and formerly a banker of this city. The Verve is a perfect type of the racing yachts built on the English deep draft principle. The bows are less fine than the run, which begins rather forward of midships. The counter is prolonged almost to a point and extends some six feet over the stern post, which has a considerable rake. The ballast, ten tons of lead, is in one piece, cast to fit the keel, to which it is bolted. Captain H. Esplin, a well known and exceptionally fortunate racing yacht skipper, with a crew, has arrived here from Chicago and will see to the rigging, and when it is completed will sail the vessel to Lake Michigan. The Verve has been already entered for all of the regattas on the lakes including those at Milwaukee, Toronto, Chicago and Buffalo.—*Montreal Star.*

QUAKER CITY Y. C.—At 10:50 A. M., on Monday, June 1, the time of starting of the ninth annual matches of the Quaker City Y. C., there was only a light breeze from the northeast, veering, after the start, to southwest, and finally dying out entirely at intervals during the day, making slow time and a tedious drift for a part of the way. Twenty-two yachts started, the well-known Minerva taking the lead. At two minutes after 2 the T. J. Pratt, fourth class sloop, turned Chester buoy, the first boat around, but it was an hour later before the larger portion of the fleet had rounded. The flagship, Commodore Vallette's Floragar, lost her topmast and head sails in rounding. After a weary drift homeward, the T. J. Pratt arrived first at 5:40:29, her sailing time being 6h. 50m. 29s. The other winners were: Sunbeam, first class; Minerva, second class; M. S. Thomas, third class; Richmond, fifth class. The prizes awarded were champion flags, silver plate, and marine glasses.

NEWARK Y. C.—In common with the New York yachtsmen the sailors of the Newark Y. C. were disappointed in the weather of last Friday, as it was the same story over again, of calms and stray puffs. The race was over the club course in Newark Bay, but the entries were smaller than usual. In the first class the Grey Eagle found wind enough to carry her around the buoy when the flood tide helped her home first, leaving the Vixen and Emmie C. becalmed for a time beyond the buoy. The prize was the challenge pennant, 36ft. long. The Rambler won in the second class, beating the Leo by a few minutes. The race for third class boats was closer and more exciting, the winner being the Triton, while the Eddie won in the fourth class. After the races a brisk wind came up and hurried all of the boats on their homeward way. The union regatta of this club will be held on June 16.

QUINCY Y. C.—The Quincy Y. C. held their opening sail on Decoration Day, eleven boats, from 16 to 21ft., taking part. The courses for the three classes were 8, 7½ and 6 miles, two prizes being offered in each class. The start was made at 3 P. M. for the first class, the second at 3:10 and the third at 3:20. The David Crockett, J. R. Putnam, 21ft. 8in., the only entry in the first class, went over the course in 1h. 25m. 55s. actual time. In the second class the Pet, J. W. McFarland, was first in 57m. 29s. corrected time; Niobe, F. L. Dunne, second in 59m. 30s. In the third class Flora Lee, D. H. Lincoln, was first, time 40m. 51s.; Elsie, C. F. Hardwick, second in 45m. 59s. The judges were George Stewart, G. A. Ordway and N. B. Furnald.

JERSEY CITY Y. C.—The yachts of this club sailed down the Bay on Decoration Day, most of them having parties of ladies on board. An entertainment was given at the club house in the evening,

Canoeing.

FIXTURES.

June 14 to 16.—Merrimack River Meet.
June 19.—Rochester C. C., Summer Regatta, Irondequoit Bay.
July 9 to 15.—Chicago C. C., Annual Cruise.
July 14.—Allegheny C. C., Cruise at Conneaut Lake.
July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 12,—A. C. A. Meet, Grindstone Island.

THE TALE OF A BOAT.

I NOTICE the advertisement of F. D. Graves in your columns. I owned the first of these boats made, and came into possession of it after it had acquired something of a history. As many as ten years ago the boat was used in New Brunswick and Nova Scotia by our lamented friend and veteran fisherman, Mr. Alonzo Prouty, of Boston, and many a time put the Indian canoes to shame for its weatherly qualities. The same boat was used in the Adirondacks by the Rev. W. H. H. Murray, and was pronounced by him the only sectional boat he could use. With this record it came into my own possession, and I have used it during several seasons in Maine, crossing the roughest carries and running the most rapid streams. I have taken this same boat or canoe to Florida, using it there all along the west coast in hunting alligators, and never had it fail me. At one time myself and friend rolled a 12ft. "gator" into the canoe, believing we had despatched him. He came to life sufficiently to squirm in such a manner as would have used up any ordinary boat, weighing, as he did, some 400 pounds. The light elmwood, of which these boats are constructed, yielded always sufficiently to prevent staving the boat. This adventure occurred at Homosassa, and several reliable sportsmen can bear witness to the fact. I have on several occasions taken deer from the water weighing 150 pounds, which is conclusive as to the staunchness of the craft indestructible, and packed her, in fine condition, for another trip to the sunny South. This was in January last, and the means of conveyance was the City of Columbus. The poor little canoe, after its long life of adventure, met its fate along with so much of far greater value. I secured another in season to take on train with party four days after the disaster. This little boat was used in both salt and fresh water all along the west coast of Florida, and was the object of particular attention at Tampa Bay and the Anclote River.

It was afterward used as tender to the sloop yacht Breeze, and penetrated from Charlotte Harbor up the Coloosahatchie River, through the Everglades, and into the mysterious waters of Lake Okeechobee. The veteran canoeist, Capt. S. D. Kendall, formerly of Massachusetts and now of Tarpon Springs, Fla., was with this party, and many a pleasant yarn of his beguiled the camp-fire smoking hour while cruising up the beautiful Caloosa. The Boston *Herald*, of April, noticed the trip as the first ever made to Okeechobee in a sailing yacht of any size. The articles signed "Tarpon," and published in the FOREST AND STREAM, relate to this same trip. My interest in writing this is purely and only that of a sportsman, in the hope that some of the brotherhood may notice and profit by a long boating experience.

BOSTON, Mass. E. W. SOUTHER.

THE SPRING MEET AT NEWBURGH.

IF the ghosts of any of the old Continentals, who over a hundred years ago garrisoned Mecham's Fort, erected to protect the chain stretched across the Hudson, were present in the old earthworks on Thursday, Friday or Saturday nights of last week, they must certainly have wondered what army had possession of their old camp ground. Tents, flags, camp-fire and war songs bespoke a warlike gathering, but the former were mostly of a pattern unknown to soldiers, the little silk flags bore no marks of bullet or battle, the "uniforms" of the party around the camp-fire were noticeable chiefly for their variety and total lack of uniformity, while the songs, which brought back to many of the older men present memories both sad and pleasant of camp-fires of twenty years since, and of the dear companions to whose memory the holiday was dedicated, told of a later and fiercer war than that in which the Revolutionary patriots were participants.

The intentions of those present were, however, of a peaceful nature, the only struggle was a friendly one, for the occasion was the first local meet of the canoeists of the Hudson River.

Following the example of the Springfield and Hartford Clubs of last year, the suggestion made last November in the FOREST AND STREAM was taken up by canoeists, and arrangements at once made for a meet on Decoration Day. Several places were suggested, the final decision being in favor of a point about 2½ miles below Newburgh on the west bank, just above the mouth of Moodna Creek. At this place there is a high bluff projecting into the river, and shut off on the shore side by a deep cut of the West Shore railroad. At the foot of the bluff is a level stretch of ground about 100ft. wide, elevated some 40ft. above the river, and on the outer edge of this plateau are the remains of the old earthworks. A roadway leads down to the beach, which is shelving but rather stony for beaching canoes. The property belongs to Mr. Verplanck, who kindly gave permission to the canoeists to camp on it.

All the local arrangements have been in charge of Mr. N. S. Smith, of Newburgh, an enthusiastic canoeist, to whose hard work the success of the meet is mainly due. Through his exertions four beautiful flags were provided as prizes, two of blue and two of crimson silk, with deep gold borders, each having a handsome sketch in oils in the center, one of Washington's headquarters, the others of views on the river. Flags were also offered by the Mohican C. C. and Gen. Oliver, a paddle by Mr. Rushton, and a Child's folding centerboard by the New York C. C.

Dr. Neidé was one of the first to arrive, and with some canoeists from Newburgh the camp was put in order, floats anchored, and the buoys set from ranges taken on the ice last winter by Mr. Smith, and on Thursday a number of canoeists arrived and pitched their tents. Thursday night the temperature fell to an extent that made camp life anything but pleasant after a winter indoors, but after that the weather was warmer throughout the meet.

By Friday morning most of the canoeists had arrived, and the camp was full of bustle and movement. To the north, in the fort, were the Knickerbockers, of New York, who mustered ten members; just opposite were Messrs. Newman and Neidé and several others, while on the south end of the row was a large tent bearing the striking cipher of the Kit Kat Club, an association of New York artists, some of whom, Mr. Seavey among them, are also canoeists. Following the path downward to the beach, the first tent was that of the Rondout C. C., with six men present. Just below, beside a rough fireplace of stones from the beach, was the Dot and the camp equipage of her owner, and above was a tent sheltering Messrs. Whitlock, Delavan and Stephens, also of the N. Y. C. C., while further up the beach were other members of the club, making in all ten present.

The most striking picture in the entire camp was that portion of the beach below "New York" where the boats of the Mohicans, of Albany, lay in an irregular row along under the green banks, each covered with a canoe tent of striped blue and white, making—with their flags flying, a large tent here and there between, sails and paddles stacked in groups—a beautiful picture of camp life. Besides the nine men from Albany there were present members of the Lake George, Amsterdam, Rochester and St. Lawrence clubs, making over fifty canoeists in all, with forty-five canoes and eighteen large tents.

The races were in charge of Mess s, N. S. Smith, C. B. Vaux and R. W. Gibson, Regatta Committee, who selected as judges, Messrs. Bartlett and Van Dalfsen, with Mr. Harrison as timekeeper. A number of ladies were present from Newburgh, and among the spectators were Josh and Hank Ward of Cornwall, the famous oarsmen. The first race was called at 2:30 P. M.

Class II.—Paddling—Course from float to buoy, thence to buoy above the float, ending at starting point. Distance 1 mile. Prize—Silk flag.

Neversink	E. Gould		K. C. C.
Red Rover	W. P. Stephens		N. Y. C. C.
Coquago	J. L. Greenleaf		K. C. C.
Crazy	R. Tompkins		Rondout C. C.

The water was calm at the start, with flood tide; all went off well together at 2:28½. Coquago turning the lower buoy first, with Red River close behind, Neversink next. The run up was very close, each doing his best; but at the upper turn Red Rover took a handsome lead, holding it until very near the finish, when the Neversink spurting finely at the last, passed him, winning the race by 1½ feet, in 9½ minutes, with Coquago several lengths astern.

At 3:02¼ the second race was started, for Class B, sailing:

Thetis	P. M. Wackerhagen	M. C. C.
Guena	W. Whitlock	N. Y. C. C.
Aurora	C. A. Neidé	L. G. C. C.
Nettie	E. Fowler	K. C. C.
Minx	M. V. Brokaw	N. Y. C. C.

Prize—Silk flag.

The course was triangular, 1½ miles, the wind being very light from the west. The order around the first buoy was Thetis, 3:10; Guena, Nettie, Aurora, and Minx, with Thetis still leading at second buoy at 3:15¼, which lead she increased on the run home, arriving at 3:23, with Guena 1½ minutes later, and Aurora third at 3:25½.

The third race, Class A, sailing, had meanwhile been started at 3:09, over the same course, bringing out

Marion	R. S. Oliver	M. C. C.
Helena	Grant Van Deusen	R. C. C.
Dido	Grant Edgar	Newburgh.
Day Dream	W. G. Van Dalfsen	Newburgh.

Marion led throughout, winning in 21min., with Helena second, 2½; and Dido third, the time over the course being the same as in the previous race.

Following this was a paddling race, Class 4. Distance, ⅔ of a mile:

La Polka	W. P. Stephens	N. Y. C. C.
Tip	R. J. Wilkin	K. C. C.
Aurora	C. A. Neidé	L. G. C. C.
Uncas	H. Pierson	M. C. C.
Minx	M. V. Brokaw	N. Y. C. C.

Prize—Silk flag.

Aurora took the lead, setting the pace for the others with a 9½ft. maple paddle, with Tip second and La Polka close behind. All were bunched at the turn, Aurora fouling the buoy with his paddle, but still pulling ahead for first place, though barred from taking the prize. The race was very close up the course, Aurora a little ahead, Tip and La Polka alternating as second and third, until Aurora halted a moment, La Polka took first place and held it to the finish, beating Tip by three feet.

After the races the visitors departed and the camp settled into comparative quiet, the canoeists grouped in parties of three and four around their fires on the beach, one engaged with a frying pan of fish, another picking over strawberries for supper, some busy with repairs to sails and gear for to-morrow's races, others setting up their boat tents for the night.

After supper a large camp-fire was lighted in the fort around which were forty canoeists. A business meeting was first held, at which a vote of thanks was passed to Mr. Verplanck for his kindness in allowing the canoeists to occupy the camp ground. A vote of thanks to Mr. Smith and the citizens of Newburgh was also passed.

After the meeting all present joined in singing, the songs at first suggested by the day being those of the war, running as the evening wore on, into sailors' shandys and college songs, and ending with a general attack on "Roll the Man Down," which seemed to satisfy all hands. The musical portion of the performance was considerably improved by the efforts of the "windjammer" of the N. Y. C. C., whose cornet solos were much more appreciated then than when in the early morning they awoke the lazy ones.

Finally the fire burned low, the songs were followed by quiet chat and stories, one by one the tired paddlers dropped out of the circle, lights disappeared as the moon shone down through the trees on the white tents, in the shadows of the old earthworks, on the river below and the Stormking towering above, and all was quiet, save

"Like a sentinel's tread
The watchful night wind, as it went
Creeping along from tent to tent,
Seeming to whisper 'all is well.'"

SATURDAY, MAY 31.

The main interest of the canoeists was centered on the race between the Dot, C. B. Vaux, N. Y. C. C., and the Snake, R. W. Gibson, M. C. C. This race was arranged last fall, Mr. Vaux challenging the Snake at that time, but it was postponed by mutual consent until the spring meet. The prize of the winner was to be his opponent's private signal—a trophy of priceless worth to a canoeist.

The prospects for a race were very poor early in the morning, as there was no wind at all, but by afternoon a strong southerly wind came up the gorge, driving a sea before it on top of the flood tide that promised wet jackets to the daring sailors.

The course decided on was from the camp around Pollopel Island, directly opposite, a distance of two miles, to be made in one and a half hours or no race. The start was made at 3:10 P. M, at which time it was almost impossible to keep the stake boat at her moorings in the strong tide and wind, while a heavy sea was running. Mr. Whitlock, being anxious to try his new canoe Guenn, was allowed to accompany the others over the course, though not in the race.

The Snake, under a mainsail of the Stoddart pattern only, with one reef in, making a lateen, started a little ahead, but stood across at once, as her board prevented her running in on the flats, but Dot, having but a three-inch keel, stood well in toward Moodna Creek, having a single reef in each balance lug at starting, lowering the mizzen, however, after beating toward Cornwall and standing across. Guenn ran down some distance and then attempted to work across.

In the strong tideway the boats showed to their worst possible advantage, but finally worked across, though failing well to leeward of the island. All now tried short tacks down on the east shore, the Guenn finally weathering the island and rounding it, coming home flying, but the others, finding it impossible to complete the race within the time limit, came home under sail, the owners exchanging flags, as souvenirs of the contest.

The sneakboxes, for which such claims have been made, were unfortunately absent, as no better water could have been found for a trial of their merits.

At the time of the next race the wind had subsided and there was no sea. The race was for Class II. canoes. Prize, Mohican flag. Distance ⅔ mile:

Helena	Grant Van Deusen	R. C. C.	
La Polka	W. P. Stephens	N. Y. C. C.	

Both started together and turned very evenly, La Polka taking the lead home, but being passed by Helena at the finish, the latter winning by 1ft.

The next race was for Class B canoes, no limit of weight. Prize, a silk flag. Course, 2 miles:

Guenn	W. Whitlock	N. Y. C. C.	
Aurora	C. A. Neidé	L. G. C. C.	

Both boats were of the same size, 15×31, but of different models, and both were fitted with the Child's folding centerboard. The wind was very light and the time consequently slow, the course being completed in 1h. 9min.

Following this race was a sailing race for Class A boats, for a Childs's board, offered by the New York C. C., over the same course.

Helena	Grant Van Deusen	R. C. C.
Siren	R. B. Burchard	N. Y. C. C.

The Helena won in 1h. 10min.

The Class 4 paddling race, for a paddle, presented by Mr. Rushton, brought out four entries,

Snake	R. W. Gibson	M. C. C.
Aurora	C. A. Neidé	L. G. C. C.
Mosquito	E. C. Delavan	N. Y. C. C.
Tip	R. J. Wilkin	K. C. C.

The Snake won, with Aurora second and Mosquito third.

In the Class B race, without ballast, for a flag, offered by the Mohican C. C., there were two entries. Distance, 2 miles.

Thetis	P. M. Wackerhagen	M. C. C.
Annie O	H. L. Thomas	M. C. C.

Won by Thetis in 1h. 4min.

The final race was for Class B canoes, no ballast; prize, a flag given by Gen. Oliver; 2 miles.

Crazy	W. Whitlock	N. Y. C. C.
Helena	Grant Van Deusen	R. C. C.
Siren	R. B. Burchard	N. Y. C. C.
Marion	C. Winne	M. C. C.
Fior da Lice	B. Fernow	M. C. C.

Won by Crazy in 39min., with Helena second and Siren third.

On Saturday night another camp-fire was held, and on Sunday nearly all broke camp, the Rondout canoeists running up to Esopus Island to camp until Monday, the New York men sailing to Newburgh to take the steamer to New York, and the Mohicans accompanying them, some to take the steamer to Albany, while several will continue on a cruise down the Walkill and Delaware rivers, particulars of which we hope to publish later.

The view on Sunday from Newburgh was very beautiful, as the river, as far up and down as it was visible, was dotted with little canoes, while the wind was strong enough to make their motions very rapid.

Among the canoeists were a number of amateur photographers, and many views were taken. Mr. Joslin, a photographer from Newburgh, also secured five good pictures of the camp and races, particulars of which are given elsewhere.

To those who were present at the first meet of the Association, and also at this meet, the improvement in boats, gear and camp equipage, as well as in handling, was very noticeable. Many details that were new and useful must be deferred to another occasion, but mention may be made in passing of the outfit of the Mohicans, their cooking arrangements, canoe tent, deck seat, new sails, and the general completeness of boat and outfit. That the local meet was in every way a success is the verdict of all present, and it will henceforth take a place among the permanent institutions of American canoeing.

MERRIMACK RIVER MEET.

Editor Forest and Stream:

As a lover of canoeing you are cordially invited to attend a local meet of Eastern canoeists to be held on the Merrimack River, four miles below Lowell, Mass., June 14, 15 and 16. Please extend the invitation to any of your canoeing friends. A beautiful site has been selected, and permission obtained to camp, in a secluded spot near Deer Leap, on high, level land backed up by a wooded hilly water supplied by adjacent springs. It is proposed to establish a genuine camp, and individuals or parties will, therefore, provide themselves with tents, blankets and three days' rations.

Fleet will leave Lowell early in the afternoon of Saturday, the 14th, and paddle down the river, running Hunt's Falls, a half-mile series of easy rapids, en route. Sunday will be passed quietly in camp and on Monday races can be arranged if desired. Break camp Tuesday morning and paddle six miles to Lawrence, from which point canoes may be shipped home or cruise continued to Newburyport (thirty-six miles from Lowell), at mouth of river.

Ship canoes ahead, care Geo. E. Stanley, truckman, Lowell, who will transport them to river for 50 cents each. For fares and freights apply to your local railroad agent. The camp will be centrally located amid beautiful surroundings, and it is hoped that New England canoeists generally will attend. Further particulars by letter on application.

Canoeists attending this meet will please report at American House, Lowell, where some one will be in attendance to receive them, between 10 A. M. and 4 P. M., on Saturday, June 14. But come early, as fleet will leave public landing, Central Bridge, at 2 P. M. sharp. Don't get left. Milk and eggs can be obtained at farmhouse near camp; other supplies must be carried. The prospect for a good-sized party is very encouraging. Canoeists who can come are asked to advise us. Our address is Lowell, Mass. F. H. PULLEN.

LOWELL, Mass., May 30. R. F. HEMENWAY.

VIEWS OF THE NEWBURGH MEET.—Mr. J. T. Joslin, of 73 Water street, Newburgh, has for sale the following views: One 14x17, from south of camp, showing Plum Point, with canoes, Newburgh Bay, etc., mounted $1.25, unmounted 75 cents. Four views, 8x10, looking south from the camp into the Highlands—No. 1, turn of paddling race; No. 2, start in Class A, sailing race; No. 3, finish in Class A, sailing race; No. 4, finish in Class B, sailing race; price each, 75 cents mounted, 40 cents unmounted.

CLEVELAND C. C.—The cold weather of the early spring has retarded canoeing in Cleveland, but several short trips have already been made, and the first capsize of the year recorded. Canoeing is firmly established in Cleveland, and the club is growing. A cruise is projected this summer by steamer to Green Bay, by rail to Jenny, Wis., down the Wisconsin River to Portage City, carrying over to the Lower Fox River, and back to Green Bay via Lake Winnebago and Fox River.

THE MOHICAN SAIL.

Editor Forest and Stream:

I saw with great interest the article on the Mohican sail in your issue of April 24, as I have been working in the same direction as Gen. Oliver. There is one detail which I would like some information upon, namely the position of the halliard block which is usually fastened at the foot of the mast. I should judge that in the Mohican sail this block must be fastened on the boom, because the sail is arranged to be taken off the mast. But if so, I don't understand what is to prevent the boom jaw being pulled away from and off the mast when one hauls on the halliard to hoist the sail. Will Mr. Oliver please explain about this?

The Mohican sail appears to be an excellent one, and I am heartily glad to see others besides me working at the problem of combining the lateen and the lug. My own effort in that direction is called the "fan mainsail," and it has worked perfectly in the two trials I have given it. It is simple and has much less gear than the lug. It has some advantages which the Mohican sail does not appear to possess, namely, part of the sail is forward of the mast, thus lessening the weight to leeward, and the sail cannot "kick up" when canoe is running. I also think it will sit flatter than the Mohican sail. On the other hand the mast, though less than three feet high, is bifurcated, which may be considered an objection.

I hope that I may have an opportunity of seeing the Mohican sail in actual operation next August. ROBERT TYSON.

TORONTO, May 24.

PITTSBURGH C. C.

Editor Forest and Stream:

The Pittsburgh C. C. held two sailing races on May 30, which were chiefly remarkable from the fact that no competitor in either had ever taken part in a canoe race before. The Class B race was sailed in the morning with very light breeze up the river; the Class A race in the afternoon with strong wind in same direction.

The course was on Monongahela River from mouth of Nine Mile River to and around a pier of the P. McK. & Y. R. R. bridge and return, about two miles in all:

CLASS B. ALL SHADOWS.

Whiffler..W. E. Woodwell...Lateen main and dandy...Keel..43sq.ft.
Mary C...W. H. Rea.....Lateen main and dandy...Keel..37sq.ft.
Reba.....G. A. Howe.....Lateen main and dandy...Keel..37sq.ft.

CLASS A.

Marguerite..G. H. Singer....Settee main & d'dy..Goodrich b'd..64sq.ft.
Flotsam.... T. W. Bakewell..S. main & lat. d'dy..Goodrich b,d..45sq.ft.
Electa.....J. K. Bakewell..Settee main and jib..Keel.....35sq.ft.
Lady Jane..B. C. Bakewell..Lateen main& d'dy..Atwood b'd...40sq.ft.
Solitude....W. H. Mimick...Lateen main& d'dy..Keel.....40sq.ft.
——.....R. W. Bailey....Settee main & d'dy Atwood b'd...34sq.ft.

The first race was rather tame, owing to the lack of wind, the Whiffler getting the best of start, and steadily increasing her lead in the run up, and reaching the bridge about 150 yards ahead of the other two which were close together. The beat back was little more than a drift, and though Mary C. gained somewhat upon Whiffler, she could not catch that canoe and finished second, Reba paddled in.

The afternoon race had quite as much wind as the inexperienced sailors cared to encounter. The sight was very pretty just after the start, with twelve boats flying along before the wind, and the excitement began with the capsize of a non contestant in a St. Paul.

Marguerite started wing and wing, but her dandy jibed and flew off the mast, which threw her so far behind that her superior spread of canvas only enabled her to catch the fleet at the turning point. The unnamed Voyageur belongs to a member who is now in Europe, and was sailed in this race by the purser of the club who, owing to the Lansingburgh fire, has no canoe of his own at present. To help out his small sail area he hoisted a 15ft. dandy as a spinnaker on his vertical mainyard for a mast, and so managed to reach the turn with the others bunched close to his rudder.

In gybing around the pier his dandy followed the example of Marguerite's, and before he could reset it he nearly fouled the next pier, and had to go around it also, so that when he got fairly straightened away he was last boat in place of first. The beat down the river was a soaker; the water flew in sheets over the canoes, and as no one sat on deck the sails had to be kept shaking to stay right side up.

This would seem to be just the place for a sneakbox, but a 12ft. by 4ft. example of that style of marine architecture which accompanied the race was both outpointed and outrun by the three Class A canoes which managed to finish. Electa, Flotsam and Solitude all took in sail and paddled home, as did the Class B boats in company.

Lady Jane took in her dandy, after which the Voyageur passed her, but the latter and Marguerite managed to struggle home, notwithstanding two or three knock-downs, the last having a 26lb. blade to her Goodrich centerboard, which was the only ballast she carried, and which finally brought her over the line a winner with considerable to spare.

AIR TANKS IN CANOES.

Editor Forest and Stream:

The subject of air-tight tanks for canoes was very fully discussed in your journal last winter. The writer, among others, was a believer in their necessity for the safety of the canoeist, and yesterday had an opportunity of testing their value.

While sailing close-hauled in the bay from Greenville to the Staten Island Kills, he fell into the unfortunate embrace of a shad pole, with the aid of his topping lift. There was a fresh breeze and a strong tide with a moderate sea, and after a few frantic attempts to disentangle himself he found his boat filled and sails laying flat on the water. While in this position he released the sail from the shad pole which he retained in hold of, and putting his weight on the outside of the boat, righted her and lowered the sails. The water was flush with the decks inside, and the coaming was all that prevented it from flowing in as fast as bailed out; but knowing that she could settle no further, the bailer was used with great vigor and to such purpose that by the time a companion catboat had come back to offer relief, it was declined with thanks, except so far as picking up the hatch, which had floated away, and in about fifteen minutes the two were again cruising home in company.

Now it may be asked, what has this to do with tanks? The same could have been accomplished without them. I very much doubt it. The boat contained besides the iron centerboard, a hundred pounds of lead ballast. But the most valuable part of the air-tight tanks is their moral effect, the feeling of confidence that you have something under you that can't sink. I shall not seek opportunities of testing them, but when again the occasion is forced upon me, I hope to be as well satisfied with the result as on this one, and I would urge upon every canoeist who sails, to make sure that his boat will support him in the water in case of accident. SURGE.

NEW YORK, May 31.

THE CHART LOCKER.

X.—MISISSQUOI RIVER.

Editor Forest and Stream:

The Misisquoi River does not run from Lake Magog, and the nearest point is North Troy, distance ten miles or so, and from that point to Lake Champlain (distance nearly fifty miles) it is navigable for canoes. There are some carries at the mill dams, of which there are about ten, they are short carries of only a few rods at most. There is some first-class fishing in some parts of the river, most notably near the mouth. But at East Berkshire there were some fine black bass caught last year. Below Troy, where the river runs into Canada, some very nice pickerel have been caught this spring. Think that it will make a very pleasant voyage for a canceist. SNIP SNAP.

ROYAL C. C.—The first sailing race of the season, reports the London *Field*, came off on Saturday, the 10th inst., at Hendon, when the following canoes entered: Violet, W. Watney; Gladys, T. F. Knowles; Merlin, E. G. Wilkinson; Imogen, H. Church; Anonyma, R. H. Harrison. The last named did not put in an appearance. They were started at 3:30, when there was a nice breeze from the S. W., and all the little boats had a reef knocked down. Violet was first off, with Gladys on her weather quarter, Imogen and Merlin being somewhat behind-hand at gun-fire. At the buoy in the bight Violet had established a good lead, and they all settled down into their places, which were maintained to the finish. The wind in the second round fell lighter, and whole sails were now carried. Violet, however, seemed to do as well in the light wind as in the strong, and increased her lead. Merlin would probably have shown up better had her skipper given her more canvas at the start; and, as her gear has been hurriedly got together, this can hardly be considered a fair test, and she may be expected to show some of her old form later on. The times of the various rounds are as under:

	1st Round.	2d Round.	3d Round.
Violet (1st prize).....	4 5	4 45	5 30
Gladys (2d prize).....	4 10	4 52	5 37
Merlin.....	4 11	4 55	5 40
Imogen.....	4 14	5 4	5 58

A CANOE YAWL.—Mr. S. W. Burgess, of the Eastern Y. C., is having a new style of double-ended cruising canoe built at Lawley & Son's yards. The boat is from an English design, and is 20ft. long, 4ft. 6in. beam, 27in. deep. She will be rigged with a mainsail and will carry 1,500lbs. of lead on her keel.—*N. Y. Herald.*

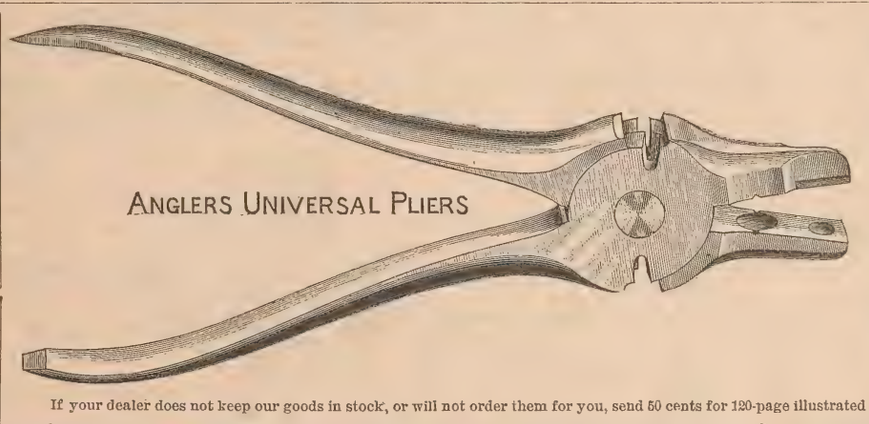
THE CONNECTICUT RIVER MEET.—The Hartford and Springfield C. C. held their spring meeting at Calla Shasta Grove, above Hartford, on May 30 and 31 and June 1. The meeting was a success in every way, and will be followed by another later in the season.

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF
Horses, Cattle, Sheep, Dogs, Hogs & Poultry.

For Twenty Years Humphreys' Veterinary Specifics have been used by Farmers, Stock-breeders, Horse R.R., Travel'g Hippodromes Menageries and others with perfect success.

LIST OF SPECIFICS.



A.A. Cures Fevers and Inflammation, Milk Fever, Spinal Meningitis, Hog Cholera, 75c.
B.B. Cures Founder, Spavin, Stiffness, 75c.
C.C. Cures Distemper, Nasal Discharges, 75c.
D.D. Cures Bots or Grubs, Worms, - - - 75c.
E.E. Cures Cough, Heaves, Pneumonia, 75c.
F.F. Cures Colic or Gripes, Bellyache, 75c.
G.G. Prevents Abortion, - - - - - - 75c.
H.H. Cures all Urinary Diseases, - - - - 75c.
I.I. Cures Eruptive Diseases, Mange, &c. 75c.
J.J. Cures all Diseases of Digestion, - - 75c.
Veterinary Case (black walnut) with Veterinary Manual, (330 pp.), 10 bottles of Medicine, and Medicator, - - - - - $8.00
Medicator, - - - - - - - - - - - - 35

☞ These Veterinary Cases are sent free to any address on receipt of the price, or any order for Veterinary Medicine to the amount of $5 or more.

Humphrey's Veterinary Manual (330 pp.) sent free by mail on receipt of price, 50 cents.

☞ Pamphlets sent free on application.

HUMPHREYS HOMEOPATHIC MED. CO.
109 Fulton Street, New York.

ANGLERS UNIVERSAL PLIERS

A very useful tool for anglers. Will split shot and fasten same to line or leader, cut wire. Can be used as a screw-driver and reamer.

PRICE, $1.00 EACH.

If your dealer does not keep our goods in stock, or will not order them for you, send 50 cents for 120-page illustrated catalogue.

ABBEY & IMBRIE, Manufacturers of Every Description of Fine Fishing Tackle,
48 & 50 MAIDEN LANE, NEW YORK.

SILK WORM GUT.

F. LATASA, 85 Broadway, N. Y.,

Calls the attention of the trade and dealers in fishing tackle to his extensive assortment of Valencia Silk Worm Gut in all grades, long and extra long, and from Extra Heavy Salmon Gut to Extra Fine. Sample thousand, 10 different grades, from extra heavy to fine, $5.00.

For price list address

F. LATASA, 81 New St., Rooms 43 & 45, N. Y.

Fishing Tackle.

Rods, Reels, Lines, Artificial Baits

OF EVERY DESCRIPTION.

Flies for all Waters.

Special patterns tied to order.

APPLETON & LITCHFIELD,

304 Washington St., Boston, Mass.

SPORTSMEN'S DELIGHT.
Merino Elastic Felt Gun Wads
SOMETHING NEW!

Ask your dealers for them. If he don't have them send us 40 cents for sample box of 256, and we will send, postage prepaid. Greatly lessens the recoil, keeps gun cleaner, gives better pattern and penetration than any other wad. One box will load twice as many shells as a box of pink-edge. Just the wad to use over powder and fill up shells, as it is only half the price of other felt wads. Manufactured only by THE MERINO ELASTIC FELT GUN WAD CO., 106 South Charles st., Baltimore, Md.

S. ALLCOCK & CO.,
Fish Hook, Fishing Tackle M'f'r's.
REDDITCH, ENG.

692R
SPRING STEEL
LONG SHANKS,
Out Points, Ringed,
CARLISLE,
S. ALLCOCK & Co.
No. (REDDITCH). 100.

Hooks made of the best Spring Steel, Swivels, Phantom Baits, Patent Standard Fly Book, Patent Waterproof Lock Joint, Trout Rods, Patent Spring Hook Swivel. All descriptions of Fishing Goods, which can be had through all wholesale houses in the United States.

AWARDS: Gold medals at Paris, Berlin, Norwich, Wurzburg and Calcutta, and the highest awards at Sidney, Melbourne, Adelaide, South Africa, Toronto, London, and other exhibitions.

Books on Sporting.

Just issued, Catalogue (No. 71) of New and Second-Hand Books on Hunting, Fishing, Shooting, Yachting, The Horse, Dog, Natural History, etc. Mainly English editions; offered for sale at very moderate prices. Sent to any address on receipt of 2-cent stamp by

I. W. BOUTON, 706 Broadway, New York.

The Willewemoc Club,
SULLIVAN CO., N. Y.

Is one of the most desirable trout preserves in this State. One share of the stock is for sale. For particulars address I. S. C., care of Forest and Stream.

JAS. F. MARSTERS,
55 Court Street, Brooklyn.
MANUFACTURER AND DEALER OF
Fine Fishing Tackle.

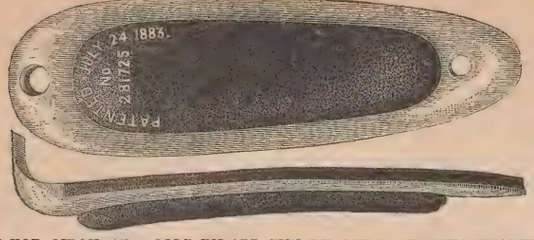
First Quality Goods at lower prices than any other house in America.

Brass Multiplying Reels with Balance Handles, first quality and fine finish, 75ft., $1.00; 120ft., $1.25; 180ft., $1.50; 240ft., $1.75; 300ft., $2.00; 450ft., $2.25; 600ft., $2.50. Any of the above Reels with Drags, 25 cts. extra; nickel plated; 50 cts. extra. Brass Click Reels, 20yds., 50 cts.; 30yds., 75 cts.; 60yds., $1.00; nickel plated, 50 cts. extra. Marster's celebrated Hooks snelled on gut, Limerick, Kirby Limerick, Sproat, Carlisle, Chestertown, O'Shaughnessy, Kinsey, Aberdeeen, Sneak Bent, and all other hooks, Single gut, 12 cts. per doz.; double, 20 cts. per doz.; treble, 30 cts. per doz.; put up one-half dozen in a package. Single Gut Trout and Black Bass Leaders, 1yd., 5 cts.; 2yds., 10 cts.; 3yds., 15 cts. Double Twisted Leaders, 3 length, 5 cts.; treble twisted, 3 length, 10 cts. Trout Flies, 60 cts. per doz. Black Bass Flies, $1.00 per doz. Trout and Black Bass Bait Rods, 9ft. long, $1.25 to $5.00. Trout and Black Bass Fly Rods, 10ft. long, $1.50 to $10.00. Also forty-eight different styles of rods for all kinds of fishing. Samples of hooks, leaders, etc., sent by mail on receipt of price in money or stamp. Send stamp for catalogue.

Established 20 years. Open Evenings. J. F. MARSTERS, 55 Court St., Brooklyn.

KYNOCH'S
Patent "Perfect" Brass Shells,
MANUFACTURED BY
KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. Cost only about half as much. Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. The crimping tool also acts as a reducer, an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by



HERMANN BOKER & CO., Sole American Agents,
101 & 103 Duane Street, New York.

JUMBOLENE

A Lotion for Sportsmen, Excursionists & Others.

Protects persons using it from the attacks of MOSQUITOES, BLACK FLIES, and other insects, and from SUNBURN and the disagreeable effects of exposure to the weather.

It is beneficial to the skin, and has no disagreeable odor; is colorless and cleanly, not staining the finest linen, and washes off readily on the application of soap and water.

MANUFACTURED BY

THOS. JENNESS & SON, 12 West Market Sq., Bangor.

Sold by the leading dealers in sporting goods throughout the country.

Harrison's Celebrated Fish Hook.

Registered.

Trade  Mark.

Whereas, It having come to our notice that some unprincipled house, to gain their own unworthy ends, and to attempt to damage our good name having spread reports to the effect that the manufacturers of the above hooks are defunct, we now take this opportunity of informing the American and British public that such reports are utterly false. The same efficient staff of workpeople is employed as heretofore, and **we challenge the world to produce a fish hook for excellence of temper, beauty and finish in any way to approach ours,** which are to be obtained from the most respectable wholesale houses in the trade.

Signed, **R. HARRISON, BARTLEET & CO.,** Sole manufacturers of Harrison's Celebrated Fish Hooks, Redditch, England.

Manufacturers also of Fishing Tackle of every description. Sewing and Sewing Machine Needles.

Chubb's Game Pieces,

The finest ornament for a Sportsman's Dining Room ever made.

Natural "Dead Game" under glass, and no more bulky than an ordinary picture.

Will send per express C. O. D. subject to approval, on receipt of express charges.

Send for photograph and prices.

THE PETMECKY

GUN CLEANER.

The only Cleaner that will thoroughly clean a gun barrel, doing the work equally well in choke bores without adjustment. Will do the work quicker and better than all other implements, for the purpose, combined. Price, $1.25. By mail, 10 cents extra. Ask your dealer for it. Discount to the trade. Circular free. **J. C. PETMECKY,**
Wholesale Dealer in Guns, Fishing Tackle, etc., Austin, Texas.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.,

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON as above.

THIS

Is our Skeleton Coat or Game Bag. Weighs but 15 ounces. Can be worn over or under an ordinary coat. Has seven pockets and game pockets. It is of strong material, dead grass color, and will hold the game of a successful day without losing a hair or feather. We will mail it to you, postage paid, for $2.00. Send breast measure.

The "O.C." New Model Patent Perfection

TREBLE MULTIPLYING REEL,

WITH CLICK ATTACHMENT,

Is the handsomest and most practical Reel Made.

Following are its points of excellence:

Center Action, an entirely new feature for a multiplying reel.

Balance Handle, revolving within a projecting metal band, no chance for line to catch upon the handle.

A Treble Multiplying Click, when the index is in the position as shown in the above illustration.

A Treble Multiplying Free-Running Reel, when the index is pushed to the right.

Raised Pillar, permitting the extension of the spool, thus increasing the carrying capacity of the reel fully one-third and greatly reducing the weight. **Material and Finish, the best. Price,** "within reach."

Please order the above "Patent Perfection Reels" through the *Dealer in your place.* If for any cause you can not so obtain them, please advise me and I will correspond with you.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JUNE 12, 1884.

VOL. XXII.—No. 20. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

ANSWERS TO CORRESPONDENTS.

With its compact type and in its permanently enlarged form of twenty-eight pages this journal furnishes each week a larger amount of first-class matter relating to angling, shooting, the kennel, yachting, canoeing, and kindred subjects, than is contained in all other American publications put together.

FIRST RIFLE, THEN SHOTGUN.

THE rifle goes first into a new country, then follows the shotgun. The former is a necessity, the latter a luxury. The rifle protects life and property from the marauder, savage or civilized. It supplies food for the family. It destroys the wild beasts that would prey upon the settler's stock. The shotgun is used in the hours of leisure and recreation. Food captured by its aid is a delicacy. It is the implement of sport. Such has been the course of the two weapons in North America.

The hardy pioneer disdained to kill his game with more than the single ball, which it was his boast that he could plant wherever he chose, and in his expert hands the old crooked stocked pea rifle became the terror of the savage tribes into whose territory he pushed his fearless way. Many years later, when the land had been cleared and waving fields of corn and wheat had taken the place of the wild grasses that once grew rank and thick over the prairies and along the valleys, when the larger game had almost entirely disappeared, the children or the grandchildren of the rifle man began to use the shotgun. Then the geese and ducks, the noisy grouse and the brown quail, the whistling woodcock and the twisting snipe became the objects of pursuit to those whose fathers had killed the moose, the buffalo and the elk.

The fathers hunted for meat. With them it was a fight for life, and each ball and each charge of powder was to be accounted for, and must do its work. The sons have inherited the hunting spirit from their sires, but no pressing need now drives them to the field. They shoot for pleasure—wildfowl and game birds when they can; but where these are not to be had, too often the tiny song birds become their prey.

We have seen with our own eyes the expulsion of the rifle by the shotgun from more than one section of this country. Time was—and not so very long ago either—when the shotgun was scarcely known in Central Nebraska. Then, the Sioux or Cheyennes or Arapahoes had to be fought off; and the buffalo, the elk, the deer and antelope were needed for food. Years rolled by, and now the rifle has disappeared. Either it has gone westward to the mountains with its owner, or rusty and dirty it stands neglected in a corner of the garret. But all the men and small boys have shotguns, and the geese in the river bottoms, the ducks in the sloughs and the quail in the towheads have a hard time of it.

There are many localities where, in the space of a single lifetime, the Indians and the large game have both been exterminated. The men, who in early years learned to use the rifle with deadly effect, find it difficult when middle life is past to adapt themselves to the handling of the shotgun. Such oldsters still carry the rifle, and, although the game for which the single ball is required has passed away, they are still able to do deadly execution on the tiny mammals that remain. Such men feel the mortification of a failure when they do not strike the head of a squirrel among the topmost boughs of a tall forest tree. This animal and the little gray hare now constitute the objects of their pursuit.

There is a wide difference between rifle shooting at game and at the target, and the weapons used for these two purposes are not less diverse. There appears recently to be a demand for rifles which may be used on the small mammals, and such an arm is really needed. Some rifle of very small caliber and carying a proportionately small charge of powder, would be welcomed by many of our readers in the South and Southwest, and might be an extremely useful arm.

We hear too little in the columns of FOREST AND STREAM of the sport of squirrel shooting in old-time fashion, and yet there are hundreds of riflemen to whom it is the most delightful form of sport.

In British North America the shotgun has always been the arm of the Indians of both coasts and a considerable part of the interior, but that is because the smoothbored musket was first introduced and the rifle is not to be had. The old-fashioned trade musket or the cheap double-barreled shotgun, loaded with a round ball and a few buckshot, is the deadliest weapon known to these Indians.

In the settling up of a country the weapon adapts itself to the game to be killed. So long as large mammals are abundant, the rifle will hold its own; but when these are gone, it must give place to the "scatter gun."

What shall we use when the birds too shall have disappeared?

INTERCHANGEABILITY IN FIREARMS.

AN interesting article in the current number of the *Magazine of American History* throws some light upon the origin and growth of the interchangeable system in the making of small machines, more particularly in connection with the manufacture of small arms. The system of course is applicable to many branches of mechanical art, but it is specially adapted to firearms produced in large quantities, and where cheapness and uniformity are a matter of such great consequence. There were in the development of the idea a series of men engaged, and the present system of turning out parts, which need only assembling to make the perfect arm, was not brought about without much opposition and prophecies of failure. Eli Whitney stands out prominently as having had a clear idea of the interchangeable system, and as having introduced some of its features in the Whitneyville Armory even before the close of the last century. A Yankee school teacher in the South, he saw the need of a machine to do the work which his cotton gin now so well performs. His ingenuity was turned toward firearms, and he found abundant room for improvement in the old flintlocks of the period.

The first breechloader invented by Hall was designed with particular reference to the use of a modified system of interchangeable parts, but it was a long time before the United States muskets could really be classed in the category of interchangeable arms. When in 1838 the new model musket was made by Benjamin Moore, the master mechanic at the Harper's Ferry Arsenal, model arms were made and sent out with sets of gauges. All these efforts were, however, rather in the direction of getting uniformity, than in securing what we now know as the interchangeable system.

The superior facilities of the Springfield Armory enabled it to outstrip the Harper's Ferry establishment, and it was there that the system under discussion was most vigorously pushed. Thomas Warner, now in his ninetieth year, deserves most of the credit for bringing about the changes from the old hand method to the new machine modes in the Springfield works, and the making of interchangeable breech screws by Cyrus Buckland, in 1852, completed the first chapter in the story. These pioneers may see the results of their effort in the great Yankee workshops of to-day, in the watch factories and the sewing machine works, where the turning out of single parts by machine tools, swiftly and accurately, has completely revolutionized important branches of industry.

The first step attempted in firearm making was uniformity, and the French mechanics in the National armories were very ingenious in this direction. The London Exhibition of 1852 brought revelations to the European workmen, however, in the exhibits of Robbins & Lawrence, of Windsor, Vt., and the revolvers of Colt. These showed that the American mechanics had far surpassed their transatlantic fellows in the direction of uniformity of parts, and that advantage then gained has not yet been relinquished.

A history of the manufacture of United States muskets, since the establishment of the Springfield Armory in 1795 and the Harper's Ferry shops in 1801, would include, if fully told, the story of the growth of the interchangeable system. Looking back from this date, it would seem almost as though the change was inevitable, but to many of those in authority from time to time there was a tendency to sharply snub the enthusiasm of mechanics who insisted that there was room for improvement in the methods then in vogue. There were notable exceptions, and in the long line of superintendents and inspectors of the National armories have been many officers who brought encouragement to those men having the ability to devise and the skill to construct the needed machinery. Hand-filing gave way to machine cuts of the greatest accuracy, until now the most complicated parts of the too complex arms of to-day are cut quickly, automatically and exactly. Difficulty in getting skillful mechanics had much to do with forcing this use of machinery to the front. Sharp competition, demanding cheapness of production, had much more to do with bringing about the advance, but its importance can scarcely be overrated. Compared with other outcomes of the original idea, firearms have taken a comparatively retrograde movement. There are many points of real crudity about them, and it is time for the sister art of chemistry to come to the aid of the armorer and offer a substitute for the gunpowder of former days.

It is no wonder that the writer, who, having watched the progress of this wonderful mechanical growth, should say: "Witnessing the results of the development of this mechanical idea, seeing them in the swelling tide of statistics, realizing them in their vast influences upon the conditions of human life, and dwelling with anxious concern upon their probable consequences on future culture and character, I plead no apology for ranking the mechanics among the great idealists in other fields of thought, while I reckon that the rise of many an empire is already dwarfed in historic moment by the rise of this mechanical ideal."

A SORT OF WILD CONTENTMENT.—Mr. Julian Hawthorne is a son of the man who wrote "The Scarlet Letter," and the *Century* magazine is a publication which claims to represent the better class of the periodical literature of the day. When the *Century* prints an article by Julian Hawthorne it is not asking too much to demand that it be free from twaddle. Here is an extract from an article contributed by Mr. Hawthorne to the June number of that magazine:

> The hunter and the sportsman are two very different persons. The hunter pursues animals because he loves them and sympathizes with them, as the champions of chivalry used to slay one another—courteously, fairly, and with admiration and respect. To stalk and shoot the elk and the grizzly bear is to him what wooing and winning a beloved maiden would be to another man. Far from being the foe or exterminator of the game he follows, he more than any one else is their friend, vindicator, and confidant. A strange mutual ardor and understanding unites him with his quarry. He loves the mountain sheep and the antelope, because they can escape him; the panther and the bear, because they can destroy him. His relations with them are clean, generous, manly. And on the other hand, the wild animals, whose wildness can never be tamed, whose inmost principle of existence it is to be apart and unapproachable—those creatures who may be said to cease to be when they cease to be intractable—seem, after they have eluded their pursuer to the utmost, or fought him to the death, to yield themselves to him with a sort of wild contentment—as if they were glad to admit the sovereignty of man though death come with the admission. The hunter, in short, asks for his happiness only to be let alone with what he hunts; the sportsman, after his day's sport, must needs hasten home to publish the size of the "bag," and to wring from his fellow men the glory and applause which he has not the strength and simplicity to find in the game itself.

We advise Mr. Hawthorne to stick to his novel writing.

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

II.

ONE night when the November wind was growling among the stunted firs that crest old "'Tater Hill," already grizzly with more than one snowfall, the brotherhood of hunters and fishers, story-tellers and listeners came stumbling along the rough frozen roads and across the frosty fields to Lisha's shop. The little box stove was no longer cold; its red jaws grinned defiance at approaching winter, and its cheeks blushed with a ruddier glow than the summer's rust had given them, and its warmth heightened the odors of tannin, wax and moldy boots that always hold their own in the atmosphere of the cobbler's shop. The firing of the stove would have unseated two visitors if a couple of sap tubs with a board laid across them had not made room for twice as many, and this was now the coveted first place for the coldest comers to sit in and thaw out their chilled marrows and their wells of conversation. To this extent had Sam Lovel been warmed when he opened his lean jaws and said with a sigh of pent-up satisfaction, "Ah, wal, Lisher, I ketched a-nuther bear t'day."

"Dew tell!" said Lisha, drawing hard on the waxed ends with which he was closing up a ripped boot-leg. "Wal, Sam, was he 's heavy 's ole Cap'n Powerses hog was? 'Killed tew hogs terday,' sez 'e, 'both on 'em good ones, but one on 'em was a sollaker, I tell ye—weighed ninety!' Was ye' bear 's heavy 's that, Sam?"

"Wal," Sam asked, "haows three hund'ed an' seventy-seven? That's his heft ezackly."

"Real weight or guess weight?" some one asked.

"Why, real weight, 't course, an' no guessin' 'baout it."

"Where 'd ye weigh him?"

"T' hum," Sam replied shortly.

"Sho!" sneered the doubter, "ye haint got no scales nor bolances! Haow could ye weigh 'im t' hum?"

"Wal, naow, I did weigh 'im fair an' hones', an' he weighed jist ezackly what I tell ye. I c'n lift jist three hund'ed an' fifty paound, an' I couldn't lift him inter j-e-s-t twenty-seven paound. Naow 'f that don't make three hund'ed and seventy-seven, I haint got no 'rethmytic."

A long young man, whose arms and shanks seemed to have lengthened beyond his means to keep them clothed, ventured to say as he looked admiringly upon his new buck-skin mittens, too precious to be taken off his hands, but kept opening and closing and turning on them just before his eyes, "The's a painter a hantin' on Hogs Back, I dew raly b'lieve, I hearn the gol darnedest yollupin' up there t'other night, julluck a womern a hollerin', 'n' I hollered, 'n' it arnswered, an' comin' nigher, 'n' then I started my boots fer hum, I tell ye!"

"Sho! Sho! Peltier, yew git aout!" Lisha roared, for he thought it his exclusive right to see and hear all strange things first, "'Twan't nothin' but a big aowl, I bet ye!"

"Twan't no aowl," cried Peltiah, clapping his mittened palms together with a resounding smack, "'twas a annymill! Guess I know a naowl when I hear 'im!"

"Wal, mebby 'twas a lynk. A lynk 'll git up a c'nsid'able 'f a skeery yowlin', 'n mebby 'twas tew ole tomcats a fightin' up 't ye' west barn. D'ye ever hear, boys," Lisha continued without waiting for any reply from Peltiah, "baout Joel Bartlett's Irishmun 't he sent up int' the aidge o' the parster a choppin' one day? Didn't ye, none on ye? Wal, up he went, and bimeby he come a runnin' back scairt half ter death, an' hollerin' 'murther! O, murther! it's a painter I seen, sure 's me name 's Pat Murphy!' 'Show!' sez Joel, 'haow 'd he look, Patrick?'

"'Wal,' sez Pat, 'he was yolly, sur, an' he had a long tail on 'im.'

"'Wal, naow, Patrick, wa'n't it aour ole yaller tomcat?'

"'Be gob, sur, it moight,' sez Pat, an' he lit his pipe an' went back to his choppin' 's contented 's if he' hedn't never ben a painter in V'mont."

Peltiah's panther being thus contemptuously disposed of, the conversation turned for a time to owls.

"Aowls," said Lisha, as he rolled a waxed end upon his aproned knee, "'ll make a turable onairthly an' skeery noises, p'tic'ly big aowls, which the's more 'n one kind on 'em, hoot aowls, an' white aowls 'n I d' know what aowls. I've hed 'em make my hair stan' right strot up, sence I was older 'n Peltier is, tew."

"Wal, I don't keer a darn what ye say," said Peltiah, after breathing through the back of his right hand mitten to assure himself for the hundredth time that it was genuine buckskin, "'twant no aowl 't I heard, 'twas a nannymill! 'F I hed me a rifle I'd go a huntin' on 'im," but he could arouse no interest in his panther further than the offer from Jonas Gove of his rifle for half the bounty if the panther was killed, or a half a dollar a day for the use of the weapon, which was declined.

Tom Hamlin said that he had heard "a dozen gret aowls a hootin' an' a shoutin' as he come along."

"Yaas, Tawmus," said Solon Briggs, who was weather-wise as well as otherwise, "so'd I, an' the's goin' to be some kind o' fallin' weather 'fore long, you see 'f the' haint."

"Wal, yas," Tom assented, "'most allus the' is arter they hoot so. Haow d' y' 'caount for it, Sole?"

"Waal, I'll tell ye, Tawmus. I've meddytated on 't c'nsid'able an' my idee 's this"—crossing his legs and putting his right forefinger into the palm of his left hand—"D'ye ever have the rheumatiz?"

"Yas, I've hed 'em."

"'N' wa'n't they wus 'fore a storm?"

Tom nodded repeatedly, and said "they was wus."

"Waal, naow then," Solon continued, "the aowls 't we hear is big aowls, an' nat'ally they're old aowls, 'n' they've got the rheumatiz, an' when the's a storm a-comin' on the rheumatiz begin to rack 'em, an' they holler aout. Haint that re'son'ble neow, and"—looking around upon the company and bringing down his finger with a clinking smack upon his palm—"and phillysoffycable, so to speak?"

"P'haps," said Lisha, as he rasped his knife upon the sandstone, "somebuddy could tell us suthin' 'baout shootin' aowls; haow is it, Jozeff?" he asked, looking between his shaggy eyebrows and the top of his spectacles at a thickset fellow who was taking his ease in a further corner of the shop.

"Naow, Lisher," said Joseph, "yeou keep on tellin' yer stories an' lemme 'lone, if yeou please."

"Jozeff," said Lisha in a terrible voice, shaking his knife at the unwilling story-teller, "yeou tell 'baout ye shootin' the aowl, er I will!"

"Wal then," said Joseph, slowly getting into a sitting posture and knocking the ashes from his pipe, "I guess you'd make it wus 'n I would, 'n' so I'll tell it. Ye see, the' was a big aowl come, gol blast him, an' kerried off half a dozen, I d' know but more, no mebbe baout that 'maount o' M'ris' chickins, an' I tole M'ri, I did, 't I'd fix him 'fore he knowed it. So next night, I guess mebbe next night arter, one er t'other anyhaow, I looked aout the winder an' I seen him a sittin' on a close pos' an' I got my gun, I did, an' hid. M'ri open the winder kinder easy, an' I poked the gun aout an' onhitched on 'im, I did; but somehaow the gun wa'n't loaded fur aowls, er I was too fas', er suthin, an' I never teched 'im! Shot over, I s'pose, any way I thought I did. Wal, next Monday night when the close was all a hangin' aout, he come agin, he did, an' sot on the same close pos'. I hed the ole gun already, an' M'ri opened the winder agin, an' I run 'er aout, an' took dead aim a foot below th' aowl, fur sez I to myself, sez I, I won't overshoot this time, sez I, an' I let flicker, an' I be darned if I didn't miss him, but, by gosh! I blowed my harnsome shirt 't hung right below 'im all to flinders, I did. It tickled M'ri t' think 't I made sech a good shot, an' I spec' she tole on it. I didn't, not fust, I don't b'lieve, 'n' Lisher, darn his ole picter, he got holt on it." When the laugh subsided, Joseph added, "Wal, 'twa'n't a bear, 'n' he didn't tear my insides aout, if my shirt did git tore!"

Uncle Lisha tossed the mended boot to its owner, who sat nursing the stockinged foot to which it belonged, and laying aside his tools arose and took off his apron, which was a signal to his visitors to depart, and so they faded away in the starlit night.

AWAHSOOSE.

VERMONT.

LASSOING A MAN-EATER.

I SPENT the month of February in Nassau, New Providence, with two most congenial companions. While I am not much given to keeping an elaborate diary, still I could not refrain on this occasion from making a few notes of the events of each day. The following is just as it was written at the time and is merely a note book jotting:

"Johnson, what is that dark object between us and the lighthouse?" I asked as something caught my eye bobbing up and down on the waves.

"That, sir, is a dead cow, sir; they towed it out from Nassau this morning, sir, and it won't be long before the sharks have it eaten up too, sir."

Sure enough, scarcely were the words out of our skipper's mouth before I saw a black fin slowly glide around the floating carcass, then a flap of a great tail out of water, and we could see the man-eater at his breakfast.

"Quick! Johnson. Steer for it."

Nearer we came, and standing on the boat's thwart, I counted seven sharks, some feeding, some circling about and others fighting; at least they seemed to be quarreling over the choice morsel that had fallen into their jaws. Oh, for a gun, revolver, or even a large hook of some kind. Here was a chance to gratify a long-cherished wish. How many times the Judge had said: "I don't take any stock in this fishing for salt-water fish with a long hand line over the side of a boat, but I would like to catch a shark." Now here was just the opportunity and we had nary a thing to make the capture with. By this time we had made the carcass fast to the boat's stern with a light line, and the anchor had been dropped to prevent our being carried out by the tide. We sat in silence and watched these tigers of the deep for perhaps an hour. By that time they had eaten the entire head and a large part of the body. They seemed to care not a bit for us, now rubbing against the frail boat's sides, again dashing with head out of water clear on top of the cow. Some of them were monsters fully fourteen feet long, others were not more than one-half that length. The little fellows would watch their chance, when the big ones had taken their bite and retired, to rush in, make a grab and scoot, and all this time we sat and looked on and could do nothing. Once the Judge remarked:

"Billy, you have the reputation of always being loaded, or at least carrying a shooting-iron. Now I am sorry to be disappointed in you." "Frequently a man has a tough reputation, Judge," I replied, "but he is the victim of circumstances. Now I will admit I look hard and tough, but I am not the cowboy in every sense of the word, though I get the discredit of it."

At first we were rather afraid of the great jaws and wicked eyes, but the old saying, "familiarity breeds contempt," was again illustrated. I picked up a small sponge hook such as the sponge hookers of these islands use in bringing up sponges from the bottom. The staff was broken, so it was only four or five feet long, but it was strong enough to hit one a smart rap on the head with, and after rapping a few of them I had the monsters well stirred up.

I had spent a winter on a cattle ranch in Texas some years before and there learned to throw the lasso, and the thought came to me that I might rope a shark. They had no horns certainly to throw the rope over, but I once could pick up a steer's foot when said steer was under tolerably fair headway, and why not get a noose around a shark?

The wind had nearly died out. Nassau lay two or three miles to the southward, as sunny and white as always. Had there been breeze enough we would have anchored the defunct bossy and sailed to the town so near and yet so far, and got a gun or spear, and returned and filled the boat with sharks. But, of course, the wind had failed us, besides we would in all likelihood have found the cow very much wasted upon our return.

I took the main sheet, fastened one end to the mast and quickly made a noose in the other. I noticed that a number of the sharks came at a good speed, and as they neared the cutter they would turn nearly belly up, and grab a chunk from the under side. If it was not readily detached they would grab again for a fresh hold and frequently would lift the entire body nearly clear from the water.

I knew it would be no use to try for one of these underhanded chaps, but waited for one to tackle the outside hold. I had not long to wait. Some ten or fifteen rods away I saw one coming that I knew meant business. There was a sort of a ten-pounds-of-round-steak-and-give-it-to-me-quick expression about his countenance that I particularly liked. He was not as large as some of them, but would do for a starter. On he came, with no bashfulness or diffidence noticeable, and dropped his jaw or else raised his head and left the lower jaw where it was, I cannot say which, as I was becoming just a trifle excited. At any rate, about the time he had his head nearly two feet out of water and had made up his mind to grab right then, the rope was thrown and, as good luck would have it, struck in the proper place, and his head was well in it as I straightened it out with a good strong jerk; the noose tightened eight or ten inches behind his gills and then the fun commenced, also the excitement. Just imagine you were there. I yelled as the rope fetched up with a savage yank that seemed about to take the mast out of the craft, but it did the business, as it tightened it so that Mr. Shark had no other wind than that tied up in him. He pitched, tugged, plunged, twisted, reared, snorted and squirmed. He didn't skip a note, and after he had finished all of these commonplace maneuvers, he put in a few on his own hook (this is not a pun). Though the rope was fastened to the mast near the center of the boat, the terrific exertions of the choking shark sent us whirling in every direction. After awhile he began to show signs of having enough of everything except stale air and strength, and as he quieted down we pulled him alongside and belabored his head with a club and I out with my knife and stuck it into him where I thought it would do the most good. He gave up completely. I think the life was choked out of him. With a strong pull and a pull all together we brought him over the side and into the boat. We did not care to be on too familiar terms with him at first, as he might have been playing 'possom and come to, and one swish of that tail would have taken us off our pins.

After the deed was done, we shook hands, the Judge and I, and thought how we could crow over Jack, who, as usual, was afraid it was going to blow and had us put him ashore that morning after we had started. Our next move was for shore, to glory over our fellow men. "Now, Johnson, let go that bovine remnant, up anchor and for Nassau. This beats 'groupers.' No such fishing have they had here this winter." The light breeze slowly fills the sail, and we glide toward the town, and all impatience, whistle for a stronger puff, but whistling don't always bring it, so we had to wait. It seemed as though we would never reach the stone steps marked by the flagstaff in the distance, but without many more tacks we are there. Jumping ashore, a darkey is sent after a donkey cart, and the loungers always found on the wharf lend a willing hand—expecting the pennies, of course—to haul the captive ashore and onto the cart. Then the triumphal march begins. It is led by the Judge and myself, arm in arm, followed by the sleepy burro, drawing the cart, on which was laid the eleven feet and eight inches of shark; and as the papers say, "citizens on foot" brought up the rear, said citizens consisting of a string of twenty or thiry negroes in usual Nassau winter costumes, *i. e.*, pants, part of a shirt and a hat. We proceed up the narrow street into the hotel yard, and halt at the doorway of the Royal Victoria, unload the freight on the greensward beneath the "gumber limber tree, sah."

We are the heroes of the season, as we modestly relate the story of the shark. I let the Judge tell it, his reputation for truth being better than mine. Johnson and the dead fish verify his statement and no impertinent questions are asked. But where is Jack? The Judge intimated that he is probably in the shade keeping his "skin from cracking." We easily found him and dragged him forth.

"Jack," said the Judge, "what kind of fish do they catch here?" Without a moment's hesitation he named the same old string that we had heard from every darkey on the island from one to six times. "Margate fish, hamlet fish, mutton fish, yellow snapper, runner, grunt, hind," and ended as ever, "dar be de grouper."

"Well, so I have understood," replied his Honor, "come up here, we have caught a grouper." The story was gone over again, and we had a jelly cocoanut with Jack. So much for one of the most enjoyable of the many happy days at Nassau.

I have now against the wall of my den the backbone and tail, also the polished jaws with their six rows of serrated teeth of the man-eater, and they bring back to memory the sunny island with its white city set in verdure, its clean blue green waters and coral reefs, fruits and darkies, and plants, and there comes over me a wish to catch another shark ere I grow too old.

WM. B. MERSHON.

EAST SAGINAW, Mich.

HOW OLD MISTIS KILT ER BAR.

ONE bright Sabbath morning in the early spring, after eating a late breakfast, I lighted my pipe and strolled down to the border of the little lake, near which stood my modest domicile. There, squatted *à la* Turk upon two cypress logs toggled together and projecting into the lake, I found my ancient colored friend Stephen Slaughter. Sitting there upon this quiet Sabbath morning engaged in kneading cotton lint into a ball of dough, at peace with the whole world and without a single care for the future, he was doubtless happier than a billionaire would ever dare to be.

Albeit never disposed to censure my fellow man for indulging, even upon the Sabbath day, in any of those innocent pleasures or recreations that serve to lighten the burdens of life, and although in the present case I felt a sympathy with, and condoned the sin, if any, of the peaceful occupation in which my old friend was preparing to engage, yet envious perhaps of the happiness and contentment that shone in every linament of his dusky face, and hung in every fold of his tattered raiment, I began to lecture him upon its evil. He looked down shamefacedly, and listened in silence until I made an end of my sermon, by asking him if he was not aware that he was breaking one of the sacred precepts of the Decalogue. Pretending not to understand the meaning of my language, he looked around him, as if examining the stability of his seat, and replied very quietly that he did not think "dem logs were gwine ter break."

Feeling that my lecture was a failure, I sat down on the bank near him, and soon began to take an interest in his unsportsmanlike proceedings. The game he was preparing to ensnare is a habitant of the waters of the South and West, known by the name of buffalo—a scaly, sucker-mouthed fish, often attaining a weight of from twenty to forty pounds. They are rather a coarse fish and full of bones, but not unpalatable when caught at the proper season. Our colored friends sometimes jerk or dry them in the sun, but when cooked after undergoing this operation the aroma exhaled is not exactly that which is wafted from orange groves or the "Gardens of Gull." My old friend's manner of capturing these "buflers," as he called them, was as follows: To the end of a short line, which was attached to the extremity of a stout pole, he fastened several large hooks so as to have their bearded points project all around from a common center. This he called a grab. Upon the same line, above the larger hooks, he tied several small hooks, and these he baited with the dough into which I had found him kneading the cotton lint. The float upon his line, when the hooks were lowered into the water, informed him of a "nibble," when a quick jerk of the heavy pole drove the large hooks of the grab into his unsuspecting victim and he was lifted out of his element by main strength, and without either compunction or sentiment on the part of his captor.

Steve, after having baited his hooks and dropped them

into the water, looked up, attracted by the noise made by an ox cart loaded with colored women who were on their way to church by the road that ran along the lakeside. Scratching his wooly head and turning to me, he remarked that "'dem ligous fokes too good ter ketch fish sundys, but dey buys my buffers, an dey eats em too." By this time the cart had reached that point in the road where it ran nearest to the place where we sat, when an old colored mother in Israel lifted up her great black hands, rolled up her great white eyes, and in tones as if her very soul was tortured by the sight, exclaimed, "Why, bress de Lord, is dat you dar fishin, brer Steben? Fore de Lord, you is." Brer Steben did not deign to make any reply, but when the cart had passed, he said, with a low chuckle as if talking to himself, "I bets I sells dat nigger one bufler yet fore she gits home."

He had hardly ceased speaking, when the chain or fastening which held down the body of the cart in front, either broke or became unfastened, and turning upon its fulcrum, the front end of the body shot up, and hind end went down, and the pious old mother and her scandalized sisters were dumped out into the dusty road.

"Dar now," said Steve, as he witnessed the catastrophe, "I knode dat ar good oomans wer gwine ter hebin too fass." Then turning and addressing me, he continued, "Dat ole wagin turnin somerset minds me uv how my ole Mistis kilt er bar."

Knowing from experience that it required no persuasion to induce Steve to finish his yarns when once he began to spin them, I puffed away at my pipe in silence. He therefore went on with his story, which was as follows:

"Twer while we alls lived in ole Firginny, fore Mars Weyum [William] fotched us out here. One day we all black fokes wer sottin out terbarker, an Mars Weyum he wer dar wid us settin on he hoss, an he say, 'Boys, deys er shower comin up, an you alls better be gittin ter de house.' So we alls and Mars Weyum ridin long, starts fur de house. Den Mars Weyum tun roun on he hoss, an he look back ober todes de piny ole feel, an he say, 'I behanged, boys, ef yonder ain't er bar.' Only he diden say behanged (to me), you know what he say, Mars John. Well sir, we alls looks an sure nuff dar wer de bigess black bar you eber seed, des tarein cross de feel and makein fur de pines. Arter de shower wer ober Mars Weyum he tucken put Unk Bob on de gray mare, an little Pete on er mule an sont um roun fur ter reform de naberhood. Den he tell me fur ter kotch old Selim an ride ober ter ole Mistis, fur to noterfy Mars Garrett, an ter tell ole Miss, how she not ter git skeerd ef she hear um playin de dickens down in de piny ole feel. Only Mars Weyum diden say dickens, he say sumfin heap wus. Well, sir, I des jumps on ole Selim an I tuck out fassern er railroad, an when I gits dar ole Miss done gone ober ter see ole Miss Polly, an den I noterfy Mars Garrett bout dat bar, an he say, 'You lyin, you dam black scoundul you.' But I swar I aint, an den he blow he horn, an fore goodness he blow up more dem houns dan dar is fishes in dis here lake. Tis de blessed troof sir. I never did hear sich er yelpin an er yowlin. But when Mars Garrett git he whip an slosh inter em er time er too, dey des fassen up dey moufs an trot long hine us ober ter Mars Weyums.

"When we gits dar, sir, de whole endurin country done riz up. Bars diden trot roun dar like er passel er hogs, like dey does here, an de niggers dar wer des ez feer'd er bars ez dey is er lions and tagers. Dat wer one stray bar what done straggle down from de Blue-ridge Mountin. Leasways, Mars Garrett he say he speck he wer. Well, sir, dey blows dar horns, an den dey all starts down ter whar de bar jump ober de fence, an Mars Weyum he say ter me, 'You kin come er long, too, Steben.' Den I say how I ride mighty fass when I gwine ober ter old Mistis, I speck I better put ole Selim in de stable, caze I knode he wer mighty tired. But Mars Weyum say tired er no tired, I want him ter smell dat bar. An I say out loud, 'yas, sir,' an den I say ter myself how ef ole Selim smell dat bar wid me on he back, he got ter hab er better nose dan ar houn Mars Garrett got. Den I rid long slow hine all un um.

"Presenly Mars Garrett he say ter Mars Weyum, 'Billy,' he say, 'des keep dem yuther dogs back twell ole Ratler git er sniff er dat bar heel.' One time I bin hear Mars Garrett tell dat young ooman what come home wid Miss Sally from de high school dat ole Ratler nose so cole ole Marster sot he mint julups on it in de summer time, an dat how ole Miss put ole Ratler head in de milk pan ter freeze de ice cream she wer eatin, an she laff an she say she bedoggoned ef she eat any more.

"Well, sir, sure nuff fore ole Ratler git in er hundud yards uv dat ar bar track he des flung up he head, an he say come er long boys. Den dey had it. Up de hill, an by de big terbarker house, an inter de pines—way dey went, yow yow, yow yow, an evy wunst in er while I heer'd ole Music squeal out fine, des like Miss Sally do when she play on de planner. Den sir I knode things wer gittin mighty hot fur dat bar. Ole Selim he rar an he pitch an he chomp he bit, but I hilt him back twell we got inter de thick uv de pines, and den I stopt him. An I say ter ole Selim, 'Look here ole fellow, ef you hongry fur bar I aint. Den I lissen an I hear dem dogs way ober todes Roun Top mountin, goin yow yow, yow yow, an den dey went ober de mountin, an I diden hear nothin.

"I des sot dar on ole Selim and let him browse round on de grass, an I gin ter think bout dem ar bad chillun what ole Miss read er bout de bars eat up in de bible lass sundy. I git so skeer'd I des tuck dat ole pack er cards outen my hat, an all dem marvels outen my pocket, an I drap um down on de groun under ole Selim belly an den I say my prayers ober twice.

"Bout dat time ole Selim juck up he head and stick out he ears, an I lissen, an I hear dem dogs comin back ober de mountin, yow yow, yow yow, an sir dey des kep er comin closer an closer, an closer an closer, twell it look like de whole worl done tun ter houns. Fuss thing I knode ole Selim he gin er snort, an he rar right straight up, an I ketch holt de pummel er de saddle, an I snatch up my legs, an bless yer soul Mars John dat ar bar an bout two hundud er dem dogs des shot under ole Selim belly like dem menny ingines gwine fru er tunnel.

"When ole Selim come down sir, he look like he bin hear Mars Weyum say how he want him smell dat bar. He des tuck right straight arter dat bar wid me scrooched up dar wid my foots on he back, des like one dem baboons what rides round in de show.

"Presenly I hear sumfin go bou-e-e, bou-e-e, like fofe er July done come, and I looks down, an me an ole Selim wer des er flyin ober dat bar an bout er thousan er dem dogs rolled up in er knot bout big ez Mars Weyum's gin house ober dar.

"I think ole Selim muss er jump bout leas two hundud yards, but when he lit sir, I des let down my legs, an I stick my heels in he belly, an I nuver let him stop twell we git clean back ter de house.

"Ole Aunt Patsy, what wer cook, she come er runnin out, an she say, 'Name er de Lord, is dat bar done kill evybody?' I say, 'Go way, fool, I done kill dat bar so ded he done cole ez ice by dis time.' Bout dat time Mars Garrett he ride up an say how I muss git two dem mules, an put de geer on em, an drag dat bar outen de woods. I ast him easy, so Aunt Patsy cooden hear, ef dat bar wer ded sure nuff. He say how he sperience diden certerfy how menny lives er bar had. He mouten be more'n haff ded so fur ez he knode.

"Well, sir, I got dem mules an I went back wid Mars Garrett, an sure nuff dar wer dat bar stretched out flat he back, an des ez big, an des ez black ez dat pious colored ooman what roll her eyes at me while er go. Dey hitched dem mules onter dat bar, an wid me er leadin um, dey drug him outen dem pines twell dey comes ter de big road, whar it goed up Red Hill. Des fore we gits dar, Mars Garrett he say ter Mars Weyum, 'Billy,' he say, 'darn ef dat bar ar ded yet. I seed him kick.' But Mars Weyum he laff an he say ez how Mars Garrett done hang roun dat young ooman what come home wid Miss Sally, twell he think evy thing what got legs kicks. Des den dem mules drug dat bar out inter de middle er de big road, an who should be gwine up dat hill in er ox cart wid ole Unk Dan er drivin her, but ole Miss. Ole Miss wer so fat she cooden git in de carige door, so she make Unk Dan drive her bout in er ox cart, an dat how come she dar. An when she see dat bar drug out inter de road, she tell Unk Dan stop, an she say. 'Fur goodness sake, Garrett, what make you kill dat great big hog sich warm wedder fur?' Den she raise up and look ober de hine end er de cart, an fuss thing ole Miss know de chain done buss, an ole Miss come rollin down de hill des like er hogshead er barker. Bless yer soul, Mars John, ole Miss roll right smack ober dat bar, and she des spread dat bar out flat ez yer han, sir. Mars Garrett he jump down an run scotch ole Miss, an when he ax her ef she wer hurt an ole Miss say no, he say he needen ax dat bar ef he wer hurt, for he know ole Miss done squash evy breff he had outen him. An dats de way old Mistis kilt de bar," said Steve, as, seeing the water dimpling around his float, he seized his stout pole and soon landed a "bufler" for the pious old woman who had rolled her eyes at him.

TUCKAHOE.

YAZOO RIVER, Miss.

SCHOOLS OF FORESTRY.

UNTIL very lately the American ideal of a skilled forester has been a man who could shoulder an axe, go into the tall timber, and there cut and pile his two or three cords of beech or maple a day. The early settlers had to make war upon the woods because they concealed prowling Indians and occupied room needed to raise crops. Farms must be cleared before the plow could run; wood was a drug, and timber that would be worth from two to four hundred dollars an acre were it standing to-day, was burned to get it out of the way. Scarcely any one looked far enough ahead to keep belts for shelter or for future supply. Thirty-five years ago the upper part of the Genesee Valley was richly stocked with white pine and valuable hardwoods; to-day they must bring their supply from Michigan and Canada. New States have been overrun and their forests brought into market as fast as the store of the older States has been exhausted.

As settlers have gone West from the originally well-wooded regions of the East they have carried the old notions with them, and in the precious timber tracts of the new States, where it was certain that there would very soon be a high price for all the working wood within reach, farms have been cleared, without leaving shelter belts or reserves, with the same lavish thoughtlessness which marked the early settlement of New York or Pennsylvania.

We are just beginning to pay the penalties of this long-continued breach of physical law. The floods have lifted up their angry voices in warning. Pen, camera and pencil have been busy in depicting the heartrending details of deluges in the valleys of the Mississippi and its tributaries, and with few exceptions the press has attributed these floods to the true cause—cutting off the woods from steep hillsides.

It is true that, as the Cincinnati *Commercial Gazette* said, there were seven heavy snowstorms, with thaws and cold snaps coming between them in such a way that the country around the headwaters of the Ohio was sheeted in thick ice, then five great rains fell upon the impervious glassy surface, down which, as a matter of course, Undine went tobogganing at a portentous rate. But if the steep hillsides had been covered, as every such slope should be, with a thick growth of trees, for one thing the snows would not have been so firmly consolidated into ice, because the freezing and thawing would have been more moderate. Then again, the ground would have frozen very little underneath such a forest, so that when the thawed snow and rain-water began to run off, much of it, checked by the manifold hindrance of standing and fallen treetrunks, roots, moss, leaves and undergrowth, would have penetrated to the subterranean sources of springs; much would have been held, as in a vast sponge, by this undergrowth, etc., and the delivery of the remainder into the streams would have been so much retarded that by full and yet harmless stages those streams could have carried the water away to the sea.

But the same denudation that caused the excess of precipitation and its rapid delivery into the streams, prevented that excess being stored up to feed the springs, and so they will fail in the dry time when their water would be most grateful. This harm done by droughts and floods then is definite and tangible, and as was said above has been quite generally assigned to the true cause—forest spoliation.

But in the case of timber famine it is not so clear. A short supply of working wood impoverishes people in so many and such indirect ways that it is not at all sure that the real cause of the suffering will be seen by most people. There will be hard times, and folks will not know exactly why. The price of every article one uses will be a little dearer, and as every one is under the same pressure it will be harder to sell one's labor or its products. Working wood is directly or indirectly needed for the economical production of every article we use, or for its cheap conveyance and sale to the consumer. As civilization becomes more developed and complex, a great deficit like this of more than a half billion dollars a year will be distributed so that the pressure is not at one spot much more than at another; this is one great advantage in a complex civilization. But there is this danger, that the real cause of such a distributed evil will not be so clearly discerned by the great mass of people. In a strong centralized government this would not perhaps be very bad if only those controlling matters saw the true cause of any great widespread calamity and vigorously applied the right remedies. The centralized governments of Europe have taken hold of this matter of the waters and forests with the strong hand, and public sentiment has mostly come into accord with the action of the State.

But in a country like ours the legislative and executive cannot go far in advance of public sentiment. Congress has therefore done wisely in providing for such an exhaustive statistical exhibit of the amount and quality of our yet existing forest wealth as that which has been made in the Census Office of the Department of the Interior, under the direction of Prof. C. S. Sargent of Harvard University. These statistics, among other ways of putting the facts before us, are embodied in a series of maps of the whole country and of the several States. These show by colors, *e. g.*, which regions depend partly, and which wholly, on wood for fuel; and what portions depend upon coal. One is amazed to see how large a part depends altogether and how large a part of the remainder depends partly on wood. Over thirty-two of the fifty millions of our people have no fuel but wood, and it is estimated that they use about four and one-third cords of wood each in a year, or 140,537,439 cords, valued at over three hundred millions of dollars. Then for railroads, steamboats, mining and amalgamating precious metals and other mining operations, in the manufacture of brick and tiles, salt and wool, some five million of cords more are required, making a total of over $321,000,000 worth a year used as fuel. The value of the charcoal used in the manufacture of iron and the precious metals, and in the twenty largest cities is over five millions of dollars. Of course, there is a vast amount of wood used for fuel and of charcoal of which no estimate can be made, but the above immense total is that which an estimate confessedly partial shows us.

Another bulletin (No. 17) gives the value of the sawed lumber products of our forests as over $233,000,000; but this is considerably short of the full amount. Neither does this include tanbark, rosin, or turpentine, and many other forest products.

When we come to consult the maps of Michigan and Wisconsin (Bulletins Nos. 6 and 7) and see what a small part is now left of their pine forests that used to be so confidently spoken of as inexhaustible, and then remember that had proper methods of cutting and marketing been used, the vast areas which, as the color shows, were originally covered with the precious white pine, but are now cut off, would have continued for ages to yield this timber without diminishing the stock, it is not easy to feel kindly toward those who have so robbed the present and yet more the future generations. When the end of our present seeming abundance comes, every poor man will be burdened in a great number of ways in which he is not now. It will be much harder for him to get decent clothes, furniture, lodging and wholesome food for his family. Many of those now earning a good living in the thousand and one trades into whose product wood largely enters will be out of employment, and will be added to the number of competitors for work in the occupations that remain. It will take a good while for people to make up their minds to plant and plant and plant on the scale that the case demands, and then more time and means will be spent in learning the exceedingly complex science and art of forestry; and after that it will take from twenty to fifty years before enough can be raised to supply the crying need.

When that pinch comes a well equipped forest school like those which all leading and most of the smaller nations of continental Europe maintain will be an absolute necessity. Such a school is not organized and got at work in a day or a year. We cannot take the methods and curriculums and perhaps not even the teachers of the European schools of forestry and transplant them in block to American soil. All will need modification, just what and how much can only be learned by experiment.

The State of New York has either a very large elephant or a great treasure upon her hands in the extensive forests of the Adirondacks. If the lumbermen are left to do as they please much longer those forests and the underlying sponge of vegetable substance, often three or four feet in depth, is in great danger of being burned up and washed down stream by freshets. In that case it will be almost impossible to get those areas clothed again with woods, and if they are not, then the Hudson, Mohawk, Black Grass, Raquette, Saranac and other rivers which rise in that region will almost certainly become very dangerous and destructive torrents. The navigation of their now navigable portions and of the canals connected with them and fed by them will be so interrupted and so costly that it will not pay to keep it up. Very serious and permanent damage will be done to the extensive manufacturing interests connected with these streams which do so much to give New York its place at the head of the manufacturing States of the Union. Agriculture, too, will suffer from droughts, failure of springs, and climatic irregularities.

If the State is to protect this area it will cost an immense sum every year unless, by calling in the aid of forest science, it is made, as it readily can be, a permanent and lucrative source of those forest products for which there will surely be before long a famine demand. This is a solution of the much debated and exceedingly perplexing question, which will be a vast benefit to the lumberman, the tanner, the charcoal burner, the paper-pulp maker, the health-seeker and, above all, the taxpayer.

This result can never be reached unless a good forest school is established somewhere in that region, and then, either by the State, together with the present owners of the lands (who hold all but about 750,000 of the 4,500,000 acres of the whole) or by the State alone, the entire tract should be set apart and kept in the highest possible condition as a scientifically administered forest reserve.

Such a school and reservation would be a fountain head of the practical knowledge which we must before long call to our aid to deliver us from the intolerable gripe of timber famine.

S. W. POWELL.

BROOKLYN.

GAME IN THE NATIONAL PARK.—Bozeman, Montana Ter., May 31.—Concerning the list of species of animals, stated to be found in the National Park, the caribou has never inhabited that part of the country to my knowledge, and I have hunted and trapped on the headwaters of the Yellowstone and Snake River more or less since 1871, but I never have seen nor heard of any caribou being killed in that region, nor did I ever see any tracks. The same may be said in regard to mountain goats. On the western slope of the Rocky Mountain, near Bitterroot, Deerlodge and the head of Salmon River in the Saw Tooth Range of the Rocky Mountains, mountain goats are to be found, but I have never seen nor heard of any being killed in the National Park.—AN OLD HUNTER.

Natural History.

THE RED-HEADED DUCK.

BY. REV. J. H. LANGILLE.

[From advance sheets of Birds in Their Haunts.]

ON the 30th of March (1882), while Niagara River was lashed into a tempest by a raw west wind, I saw from the north side of Buckhorn Island a flock of hundreds of redheads (*Fuligula ferina* var. *americana*) riding down the middle of the current in the most perfect repose. Nearly every one had the head resting on the back, the bill under the scapulars. Only occasionally was there one which seemed to act as sentinel.

Several widgeon, also, whose white crowns rendered them quite conspicuous, were in the flock. There was something peculiarly impressive in this long line of many abreast of living creatures, rocked and tossed on the foaming billows, and yet reposing as sweetly as if on some inland lake of glassy smoothness. Long did I scan them and much did I admire them, as the powerful field-glass brought them just before me.

A more complete study of these interesting ducks was reserved for me, however, on St. Clair Flats. Here they are most abundant in the migrations, and not a few remain to breed. In the bright hot days of June very considerable numbers may be seen diving leisurely for food along the deeper and more rapid channels, thus procuring their fare of small mollusks and fishes, the larvæ of aquatic insects and the roots and leaves of certain aquatic plants. Not infrequently the males are quite noisy, loudly uttering their deep-toned *me-ow*, which is the precise imitation of the voice of a large cat. The female, especially if rising from her nest or out of the water, has a loud, clear *squak*, on a higher tone than that of the mallard or dusky ducks, and so peculiar as to be readily identified by the ear even if the bird is not in sight. The gray aspect of the wings in flight is also very characteristic of this species.

The nest is generally built in the thick sedges over the water, and consists of the leaves of the cat-tail and of various kinds of marsh grass, a slight lining of down being added as incubation proceeds. The eggs, generally about nine or ten, but sometimes as many as fifteen, some 2.45x1.75, are nearly oval or oblong oval, having a very smooth, firm shell, and of a rich light brown tinge, sometimes slightly clouded, scarcely, if ever, tinged with blue or green. When moistened a little and rubbed with a dry cloth, they are susceptible of a high polish. The young in the down has the crown of the head and the upper parts generally, of a clear olivaceous green, the cheeks and underparts bright yellow. The eggs are fresh or nearly so the first week in June.

A stately and beautiful bird indeed is the male, as with head well up he rides upon the water. A little over 20.00 long, the bill, which is about as long as the head and rather broad, is blue, shading into dusky or black at the tip; the male has the head and more than half the neck brownish red with a violaceous gloss above and behind; the lower part of the neck, the breast, upper and lower parts of the back black; beneath, white sprinkled with gray or dusky; sides, scapulars and space between, white and black in fine wavy lines of equal width, giving a gray effect in the distance; wing coverts, gray speckled with whitish; speculum grayish blue; iris orange.

Female similar, with the head and neck grayish brown and the breast more or less mixed with gray, or whitish.

Resembling the canvas-back, it is quite distinguishable by its shorter, broader bill, depression at the base of the bill, absence of black on the head and back of the neck, and broader lines of black in the penciling of the back. Abundant on the seacoast of the middle districts, but becoming less common northward and southward, it breeds in the interior northward, moving southward in October and returning north late in March or early in April.

THE COUESIAN PERIOD?

To the Chairman Section of Avian Anatomy, A. O. U.:

SIR—Your recent article entitled "The Couesian Period" has aroused in me some curiosity, and I should therefore like to ask a few questions, which I expect you will be kind enough to answer, as I am a member of the A. O. U.

1. In your paper you subscribe yourself as "Chairman Section of Avian Anatomy, A. O. U.," and date it "American Ornithologists' Union." Does that mean that the document has any official connection with the said committee? Do the members not only agree with you, but have they had knowledge of the letter before sent? The answer to this is very important, as some one might think that the title mentioned had only been appended in order to give increased weight to your propositions, as coming from the chairman of the anatomical committee of the A. O. U.

2. Is it logical to name an epoch before the epoch has expired? You have fixed as its terminus the year 1900. How do you know that it will end there, and how do you know that no greater ornithologist will impress his name on the epoch when the time comes to name it? Whence comes the right or privilege of a professor of botany to name epochs in ornithological history before they are ripe for history?

3. Is it logical to say that a period commenced with a text book (the "Key," 1882), and that it closes with another of the same author (the "Key," 2d ed., 1884)? Is this to be regarded as a condemnation of the second edition? When the first edition started a period, the second edition ought to start a second period; how then can it close it?

4. You assume that you speak in the name of all the American ornithologists; have you ever conferred with any eminent ornithologist about the matter before making your proposition?

5. When speaking of the Bairdian epoch as ending in 1872, are you aware that three volumes of the great "History of North American Birds by Baird, Brewer and Ridgway"—certainly the grandest work on North American ornithology since Audubon's days—were published in 1874, the fourth in 1884, and that the fifth is still unpublished?

6. Are not the leading features of the present North American ornithology still "Bairdian" in the broadest and best sense of the word? Who is the North American ornithologist who can proclaim himself free from the mighty influence of that great genius, and is not following in the footpath trodden by Professor Baird? What are the scientific features distinguishing the new epoch from the past?

7. And in conclusion of the last question, who is the ornithologist—not botanist—who dare say that the Bairdian epoch has ended?

Mr. Chairman, Section of Avian Anatomy, A. O. U.: If you can satisfactorily answer these questions, then are we willing to accept your propositions. If not, we will drop "the Couesian epoch" and "the Couesian period" until the year 1900, or at least until "the Bairdian epoch" has expired.

Of course, it is not our intention to depreciate Dr. Coues's great merits as an ornithologist, but we contend that these can be duly acknowledged, without detracting an atom from the honor due to the father of modern North American ornithology. We protest against prejudicing history, and we protest against the untimely and tactless intervention of a botanist seizing the opportunity of making himself agreeable.

AMICUS SOCRATES, AMICUS PLATO, MAGIS AMICA VERITAS.

BIRD NOTES.

Editor Forest and Stream:

May 1.—Observed first chimney swallow and first sand martin; also, first brown thrush and first wood pewee.

May 2.—Mourning doves, white-bellied swallows and sandpipers seen to-day.

May 3.—Saw the first white-rumped shrikes.

May 6.—Saw first bobolink this morning; first myrtle bird or yellow-sided warbler.

May 7.—Saw white-eyed vireo; wood thrushes abundant; first catbird.

May 8.—White-throated sparrows plenty.

May 9.—The orioles as punctual as ever, arrived this A. M.

May 10.—Warbling vireo and worm-eating warbler.

May 13.—Yellow-throated flycatcher abundant.

May 14.—Saw first summer yellow bird, first night hawk, first great-crested flycatcher; two male rose-breasted grosbeaks were killed to-day.

May 15.—Saw first large flock of warblers, noticed the black-throated blue warbler, American redstart, chestnut-sided, black and white creeper, myrtle warbler. Found a golden-winged woodpecker's nest in an old apple tree. First white-crowned sparrow.

May 16.—Saw first humming birds at 5:30 o'clock A. M.

May 17.—Saw first blackburnian warblers, first spotted warbler, Wilson's thrush, first hermit thrush; also, killed a wild pigeon that measured 17½ inches in length, 25½ in alar expanse. Saw first indigo birds.

May 18.—A large flock of red crossbills made a short stay in our orchard. Saw first scarlet tanager.

May 19.—Saw two blue martins by the Onondaga creek; also saw a warbler of a very curious kind—orange-colored body and dark brown wings and tail—about size of myrtle bird. First black-bill cuckoo.

From May 20 to 27 I saw a flock of crossbills each day; have never seen any until this year.

G. ALBERT KNAPP.

ONONDAGA, N. Y.

Editor Forest and Stream:

Below please find result of my observations of the arrival of *Insessores*, as recorded by request of Dr. H. K. Fisher, Superintendent of the American Ornithological Union. Though not complete, it embraces nearly all of the S. R. of this order visiting us:

March 15th, robin; 16th, crow blackbird; 18th, bluebird; 20th, meadow lark; 22d, night hawk; 23d, plover and chipping bird; 29th, cat bird; 30th, red-shouldered blackbird; 31st, chewink. April 1st, purple finch; 10th, belted kingfisher; 17th, purple martin; 20th, cedar bird. May 3d, brown thrasher; 12th, barn swallow; 15th, chimney swift; 16th, bank swallow, crimson-throated humming bird and Baltimore oriole; 17th, scarlet tanager; 18th, house wren; 19th, golden wren; 20th, kingbird; 28th, bobolink; 30th, yellowbird.

The local conditions are not favorable for noting the *Natatores* or *Grallatores*, and I know of but three of the order *Rasores* found in this vicinity, and they are all R. Of the order *Scansores* grouped as S. R., we have only the cuckoo, and it may be classed as rare. I have not observed a single individual. Of the *Raptores* found there I believe only the brown hawk, the osprey, and the "little corporal" should be considered as S. R., and I have not seen either as yet.

L. F. SPENCER.

SPENCERPORT, N. Y. June 1, 1884.

Editor Forest and Stream:

Report of bird observations during May:

T. V.

May 1—Black and white creeper (*Mniotilta varia*).
May 3—Yellow redpoll warbler (*Dendræca palmarum*).
May 4—Common American crossbills (*Loxia curvirostra*).
May 4—Yellowshanks (*Totanus flavipes*).
May 6—Water thrush (*Siurus nevius*).
May 8—Ruby-crowned kinglet (*Regulus calendula*)—female only.
May 9—Maryland yellow throat (*Geothlypis trichas*).
May 12—Chestnut-sided warbler (*D. pennsylvanica*).
May 14—Nashville warbler (*Helminthophaga ruficapilla*).
May 14—Black-throated blue warbler (*D. cærulescens*).
May 15—Black and yellow warbler (*D. maculosa*).
May 15—Blue yellow-backed warbler (*Parula americana*).
May 17—Canadian flycatching warbler (*Myiodioctes canadensis*).
May 18—Morning warbler (*Geothlypis philadelphia*).
May 19—Bay-breasted warbler (*Dendræca castanea*).
May 21—Blackburn's warbler (*Dendræca blackburniæ*).
May 21—Black-throated blue warbler (*Dendræca cærulescens*)—females.
May 23—Olive-backed thrush (*H. ustulata swainsoni*).
May 23—Yellow-bellied flycatcher (*Empidonax flaviventris*).
May 26—Blackpoll warbler (*Dendræca striata*).
May 26—Brotherly-love greenlet (*Vireo philadelphicus*).

S. R.

May 2—House wren (*Troglodytes domesticus*).
May 3—Kingbird (*Tyrannus carolinensis*).
May 4—Baltimore oriole (*Icterus galbula*).
May 5—Chimney swift (*Chætura pelasgica*).
May 6—Catbird (*Mimus carolinensis*).
May 6—Brown thrush (*Harporhynchus rufus*).
May 6—Red-headed woodpecker (*M. erythrocephalus*).
May 6—Yellow warbler (*Dendræca æstiva*).
May 6—Red-tailed hawk (*Buteo borealis*).
May 10—Black-throated green warbler (*Dendræca virens*).
May 11—Scarlet tanager (*Pyranga rubra*).
May 12—Wilson's thrush (*Turdus fuscescens*).
May 15—American redstart (*Setophaga ruticilla*).
May 15—Red-eyed greenlet (*Vireo olivaceus*).
May 15—Sparrow hawk (*Falco sparverius*).
May 16—Humming bird (*Trochilus colubris*).
May 16—Pewee flycatcher (*Contopus virens*).
May 16—Wood thrush (*Turdus mustelinus*).
May 16—Indigo painted bunting (*Passerina cyanea*).
May 17—Nighthawk (*Chordeiles popetue*).
May 19—Rose-breasted grosbeak (*Zamelodia ludoviciana*).
May 21—Green heron (*Butorides virescens*).
May 23—Bobolink (*Dolichonyx oryzivorus*).
May 23—Bank swallow (*Cotile riparia*).

J. L. D.

LOCKPORT, N. Y., June 1.

NEW BIRD BOOKS.—We are informed that the second edition of "Coues's Key to North American Birds," has been published, but as we have seen no copy of the work we are unable to review it.

HEN AND PARTRIDGE.—A Maine paper reports that a man in Damariscotta discovered that one of his hens had strayed her nest and was sitting upon eight eggs in a pasture lot, but he also found that a partridge had added to the stock twelve eggs and was sitting in company with the hen.

RECENT ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN.—Purchased—One hippopotamus (*H. amphibius*), two slender-billed cockatoos (*L. tenuirostris*), one roseate cockatoo (*C. roseicapilla*), two black swans (*C. atratus*), one night heron (*N. grisea*), three Garganey teal (*Q. crecca*), three tufted ducks (*F. cristata*), two red-headed poo chards (*F. ferina*), one alligator (*A. mississippiensis*), one black snake (*B constrictor*), one rattlesnake (*C. adamanteus*). Presented—One common macaque (*M. cynomolgus*), two common rabbits, eight white mice, one prairie dog (*C. ludovicianus*), eleven opposums (*D. virginiana*), three flying squirrels (*P. volucella*), one red-headed duck (*F. ferina americana*), three screech owls (*S. asio*), one broad-winged hawk (*B. pennsylvanicum*), one turtle dove (*T. risorius*), two Swainson's buzzards (*B. swainsoni*), one great-horned owl (*B. virginianus*), one land tortoise (*C. clausa*), one water snake (*T. fasciatus*), one gila monster (*H. suspectum*), two alligators (*A. mississippiensis*). Born in Garden—Twelve prairie dogs (*C. ludovicianus*), one swift fox (*V. velox*).

Game Bag and Gun.

DEER DRIVING.

Editor Forest and Stream:

I have for years obtained much enjoyment from the weekly perusal of the FOREST AND STREAM, and I have been especially interested in the articles by C. H. Merriam, M.D., on "Deer in the Adirondacks" recently published by you. I have for the past thirteen years passed from three to ten weeks yearly in camp in the Adirondacks, and fully appreciate what he says regarding the various methods of hunting practiced there. But I think a little might be added to his remarks about "driving." He says, "Of the three methods of hunting heretofore considered, driving is the least sportsmanlike, and affords the deer the smallest chance of escape. It requires neither skill nor cunning on the part of the executioner; for patience and a very ordinary amount of common sense are the only essentials." This is all very true as regards the particular method of driving which he describes, but I think that the following method, which our party and many others whom I could name generally pursued, is both sportsmanlike, and requires a considerable amount of skill on the part of the "executioner."

The last of September or first of October usually found our camp pitched either near one of the tracts of land which have been burnt over (called a slash), or on the banks of one of the smaller rivers. At daybreak we were usually around the table partaking of our morning cup of coffee and a hastily prepared breakfast. As soon as possible we depart for our watch-grounds upon the slash, taking positions where the deer are in the habit of crossing the open land. The sportsmen generally watch alone, so that as many runways as possible may be watched. After a time, from the distant mountain side comes the faint note of the hound's first bark as he strikes a fresh track; now fainter, as he circles around the hills and through the valleys. The watcher must be on the alert and cannot relax his watchfulness for a moment, for he knows not how soon the deer will rush by on the run, and if he is so fortunate as to obtain a chance, it requires a quick, sure shot, to insure venison for camp. He cannot sit on the watch-ground, read or sleep, and leave the watching to his guide, and when the deer take water, be rowed within a few feet of the deer and then bang away until he succeeds in killing him; but he must depend entirely upon himself and must be able to shoot quickly and accurately.

If one wishes to enjoy the most exciting pleasure of all Adirondack sport, let him try this method of driving and experience the keen excitement which he will feel when he sees a fine buck coming toward him and realizes that he can only shoot once or twice, and that upon his skill depends the state of the camp's larder. If any one wishes to enjoy this sport, let him camp next autumn, with good St. Regis guides, near the open land to the south of Round Pond, on the north branch of the Saranac, or upon the shores of Follansbee Junior, which is on the border of a large tract of burnt slash, and, if the deer have not been driven from that section of the Adirondacks within a few years by the great number of summer visitors (not sportsmen), he can have it in abundance.

In the case of river hunting, it is nearly the same, except that the deer runs up or down the river or crosses it, giving but a moment in which to shoot. I have known parties to camp on the Meacham River and to have venison in camp all the time and to kill no deer except in the manner mentioned above. I could name a party of quite noted sportsmen who did that very thing only last September. To be sure, it is not as lazy a way as killing deer in large waters, but it is more sportsmanlike, gives the deer a chance to escape and affords the sportsman much more real gratification if he is successful.

AMPERSAND.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

One who has been familiar with firearms almost since the time he shuffled off his swaddling clothes, as I have been, could not but be interested in the discussion in your columns concerning the performance of shotguns. I have more than once been on the point of adding my mite to the contribution, but so far have been deterred from doing so by my almost unconquerable bashfulness, and an unwillingness to vaunt my own exploits. Furthermore, I feel as all sensitive old men must, who look on this roaring, surging tide of modern progress, as if I were a lumbering old craft, stranded on the shoals of old-time ideas. However, it is possible that I may give a hint or two of value to some of those who are tossing so gaily down stream.

I have used many guns from the hands of all known and many unknown makers, and though the best gun I ever shot (except one of my own invention, described some time since in my Adventures) was a Manton-Richards-Greener-Tolly-Scott-Lefevre-Colt-Remington-Baker-Parker-Sneider-English-American hammered and hammerless, single and treble-bolted, rebounding breech, top, side, and under-snap action, muzzle and breechloading, cylinder-choke, 0 gauge and twenty-four pounds weight, ordinary charge, one pound best blasting powder and four pounds condensed shot with six gilt-edged spherical wads on powder, and two half-moon wads on shot, in paper and brass shell—I have never found any difficulty in making any gun shoot tolerably well, and just as I wished it to shoot up to a certain distance. No gun, save such rare and exceptional ones as the two above mentioned can be expected to kill a chickadee clean over one

hundred yards, and it is unreasonable to ask for greater excellence.

Now, if I wish to make a long shot, and have the pellets delivered within a small compass, at the instant of the ignition of the powder I give the gun a sharp and strong push, and in the next fraction of an instant a twirl and a slight movement backward. The first adds to the force of the powder, the second and third motions draw the shot together, and produce a close pattern. If I wish to get any small bird for a specimen without injuring the skin and feathers, at the moment of pulling the trigger I jump backward, thus diminishing the force of the charge to almost any degree I desire. In shooting at a flock, when it is desirable that the gun should scatter, I give the muzzle a flirt from right to left just so far as is necessary as the shot are leaving it. In this way I once killed fifteen wood ducks at a shot, though they were sitting on a log lying exactly at a right angle with the direct line of fire. So I once killed two deer running one behind the other, my rifle being charged with two balls, once a common practice in Adironda when muzzleloaders only were used. It took nice calculation to get the second ball out at the right instant, but I accomplished it, striking the first deer just behind the shoulder, the second in the back just forward of the hips (or perhaps I should say, one behind the fore shoulder, the other before the hind shoulder. As I often read of the fore shoulders of quadrupeds, I suppose they must have hind shoulders). If any one doubts these statements, and some people are forever doubting the most reasonable statement of hunters and anglers, I can at any time show the guns with which the shots were made, and will be most happy to exhibit them to any who call upon me at my house in Adironda. Neither gun, however, is at all remarkable to look at.

Yours for the truth,

MAJ. JOSEPH VERITY, U.S.H.M.

ADIRONDA, May, 1884.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

The discussions in FOREST AND STREAM on the choice of hunting rifles have been very interesting to me. "Penobscot" wrote a very good article, and I corroborate his statements in regard to the .40-caliber. As I have hunted in Montana, Wyoming and Idaho for over fourteen years—part of the time for market, hides and specimens—I give you my experience

I have used rifles from .40-caliber up to .65-caliber, and the best killing gun I ever handled was a Sharps .40-caliber, 70 grains powder. In 1872 I killed two large buffalo cows with one single shot. The ball passed through behind the shoulders of the first and penetrated through the heart of the second, thus killing both. I also found this gun (.40-caliber) to be "dead medicine" on bear, more so than larger bores. The reason that most buffalo hunters out West prefer the .40-caliber is easily explained. First, according to the weight of powder and lead, the .40-caliber gives the flattest trajectory as well as best penetration. Second, a .40-caliber bullet makes a very small hole, where it enters the body, and as bear and most other kind of game are generally fat during the hunting season, the hair and fat plug up the hole and prevent the escape of blood outwardly; and experience clearly shows that a wound which bleeds inwardly will kill an animal in less time than a wound that bleeds outwardly. Theoretically the largest caliber rifles may be the best killing ones, but practically this is not so (*i. e.*, a .40-caliber compared to a .65-caliber). Like "Penobscot" I do not believe in the "shock paralyzing" theory. I have also used repeaters of .44, .45 and .50 caliber, and have never had any trouble with them. I think that a .40-75-225 or .40 90-240 or 300 will be the favorite cartridge for hunting large game.

At no distant date, the hunting rifles will have to take a rest, as the large game is fast disappearing in this part of the country. AN OLD HUNTER.

BOZEMAN, Mont.

TEXAS GAME PROSPECTS.

I HAVE just passed through four counties of North Texas and took my time to notice our prospects for next September. Fort Worth was my starting point.

All through Tarrant county quail are breeding, and Bob White is heard on every side. Prairie chickens are not doing so well.

In Cook county, quail are abundant, along the creeks they swarm, and are to be seen running along the roads just before the sun goes down. Pinnated grouse are more plentiful than in Tarrant county, and good shooting can be expected.

My next county was Montague, the noted home of Bob White. As usual, I found him on all sides. Creeks appear lined with them and the post oaks, known as "the cross timbers" are literally alive. I do not know of any county so well stocked. Whenever I pass through Montague county, it reminds me of Norfolk, England, and their large preserves. One thing, a sportsman once he finds Montague, cannot go amiss. Through the timber along the prairie creek, among the farms with a good dog, you are bound to fill your bag.

The next county is Clay, and the beautiful little city of Henrietta, the home of Northern Texas cattle kings. This is a prairie county. Young chickens are numerous, and next August they will be in good shape. Chicken shooting will be my first out, and Clay county I have concluded to make my grounds. The county is just fenced up into large pastures, and land that was cultivated turned into grass. These old fields I examined and found young chickens just hatched. I just put these fields down as where young chickens will lie like rocks. I have commenced to count the days so as to have the dogs ready. It is hard work in August, but our Gulf wind makes it cooler than the Northwest States. Along the creeks I also found quail doing well, and what little timber the county has is alive with quail. I put in half a day looking up turkey on Big Wichita and was surprised at the number left over to breed. I saw droves of them, and flushed several hens from their nests. Young turkey I have down on the Big Wichita for next November. I passed through into the Indian Nation and saw several bands of antelope. Took a look at Beaver Creek, and found turkey doing well. Went up to Cash Creek, and there I saw too many signs of old camps and turkey feathers scattered around. I put Cash down as shot out.

On my return home, I took a look at Red River. There I saw a little more corn planted than can be gathered. I put that down for geese next December. I have marked out my blinds, and if the driver kills any more geese with No. 10 after I have shot BBB I have made up my mind to keep quiet about it. I shall also mind and hold my old gun steady when drivers are around.

I took in Red River and found chickens very numerous, the dry season having driven them along the well-watered Red River Valley. Passing down the Little Wichita, I noticed the duck lakes well filled up and "yonkerpins" in bloom, showing plentiful feed for ducks. I turned back over the rolling hills into Henrietta well satisfied with the prospect of North Texas, and considered myself lucky to live in a country so plentifully supplied with game. ALMO.

HENRIETTA, June, 1884.

AMATEUR DEER SHOOTING.

FOR the ordinary sportsmen it is generally best to possess himself of the services of a guide, if he is set on killing game. But it sometimes will happen that no guide can be procured, and the sportsman must turn his back to the woods and count his journey and expenses a dead loss, or rely on his own undeveloped resources. In company with several other congenial spirits, I was camping on the shores of Connecticut Lake (second lake). Deer were numerous, but wary, because of the constant jack-shooting that had been going on. Several deer had been secured, none of them with antlers, however—all does. The old "snorters," as the guides called the bucks, suddenly withdrew at the sight of the familiar torch, leaving the sportsmen to take up with the unsuspecting females as his only reward in the chase. All the shooting had been done with buckshot, and, of course, at close range. It had occurred to me, on taking in the situation, that a change of tactics might bring better results. Why not use a rifle at long range and try them at daylight—say the early morning? The plan seemed feasible to all the party. I only waited a good opportunity to execute it.

I had possessed myself of a repeating rifle of .38-caliber, with which I was tolerably familiar, and a cedar boat, too large, however, for shooting purposes, but very light considering its size.

It was on a Monday morning, a heavy fog was brooding over the lake and surrounding woods; guides and sportsmen were wrapped in happy dreams as I sallied forth. I had called a mate, who, though he could neither shoot nor paddle, was taken along as a passenger. About two miles from camp, near the foot of the lake, a deep bay, undisturbed by campers, became my objective point. My plan was to allow my companion to row me down the lake; but, judge of my surprise, when, after going, as I thought, the required distance, I came in sight of the shore not far from where I had started. We had been moving about in a circle. This was not our only discouragement, however, for the loons allowed us to come provokingly near, and several times I brought my rifle half way to the shoulder with hopes of quieting their tell-tale screams.

Taking a fresh start, for we were not to be discouraged, we at length came within half a mile of the shore I had selected, when, requesting my friend to lay aside his oars, I took the paddle, and, without lifting it out of the water, sent it slowly but surely toward the bay. The fog had now lifted, and in a half hour more the sun would be above the treetops, and the case began to look hopeless; but on rounding the last point that hid the bay from sight my friend gave a start, as if he had come in contact with an electric battery. He was sitting in front of me, so that what he saw I saw not. On we went, however, till within forty rods of the shore, when, seeing nothing, I whispered my intention to go on and examine the shore for fresh tracks. It was now my turn to be startled, for my friend answered back in a hoarse whisper that seemed as loud as thunder, "For heaven's sake, look at that deer!"

Turning the boat a little, sure enough there stood before us a noble buck, regarding us with the greatest apparent indifference. On, on we went, my companion looking for all the world like a figurehead to a ship, so still and rigid were his muscles, though differing from most figureheads in that he wore a large white hat set well back on his cranium. I had now shortened the distance say ten rods, when the buck in his quiet feeding gave me an excellent shoulder shot, so letting my paddle slip into the water, I brought the Winchester, which had been resting across my lap, to a steady aim and fired. By good fortune the ball entered the spine and down came the noble game, to rise no more.

"Wal, now, boys," said Uncle Tom, speaking half to us and half to the guides who had come down to the boat landing to see our prize, "Wal, now, boys, that is the finest specimen of a deer that has been shot on this lake for many a year."

THE SNIPE HUNTING TRICK.

WHEN I came to this State three years ago, being fond of sport and having been born with a rod and gun in my hand, and accustomed to handle both on all legitimate occasions wherever sport was to be had, I lost no time in making inquiry as to where I could find some shooting. I may say that I was then in Sacramento. Having been directed to the tules, about forty miles from the city, but in what direction I do not choose to say at present, and, being accompanied by a friend, I took up quarters at a hotel in the neighborhood and proceeded to prospect. A goodly number of hangers-on were there, hoodlums, ranchers, etc., who, finding out that we were strangers in quest of sport, volunteered a prodigious amount of information as to the rendezvous of myriads of geese, ducks, etc. (this was in December). Perhaps we looked a little verdant; at all events, our new friends took it for granted that we were, and, soon ventured to try "tricks upon travelers," like Shandy of old. After telling of prodigious feats in the shooting line, including a tale of the fellow who killed 100 geese at one discharge of his 8-gauge muzzleloader, and who, it was said, was present, but being modest, allowed his chum to tell the tale. A fellow who claimed to be a professional hunter inquired if we ever hunted snipe. Giving my companion a wink, I replied in the negative, whereupon it was declared on all sides that the best snipe ground in the State was to be found within six miles. We expressed a wish to take a hand in, and the "boys" told us to be ready about dark the next evening.

The night came and so did the "boys," and my friend and self went off with them. As we were informed no guns were needed, and one of the boys carrying a lantern and a net we knew something was up, and lay low. After traveling about six miles we came to a "slew," across which we rowed in a flat-bottomed boat, and went on through tules and mud a mile or two further. Here on an open grassy spot a halt was called and our companions, four in number, told us to squat down and hold the net, while they proceeded to beat the grounds for the birds, which we were informed would be attracted and bewildered by the light and would fall an easy prey to the net. We promised obedience and expressed at the same time much curiosity to see how the affair would culminate.

As soon as our friends disappeared, Tom and ourself held a brief and hurried consultation, the result of which was that the lantern was fastened to a pole and we made "tall time" for the boat. Skulling ourselves across the "slew" we lay low again for developments. Soon we heard our friends coming although it was too dark to see ten paces. They were laughing and chuckling in high glee at the trick played upon the "greenies." The absense of the boat caused them a good deal of conjecture, as the lantern being up they supposed we were still holding the net. Being too far off to hear clearly or see their movements, but knowing well that they would have a good eight miles to go round ere they got on the home trail, we left, and before 10 o'clock were snug in bed.

When we came down to breakfast next morning, the landlord expressed his intention to do the treating while we remained, and the barroom habitués treated us with marked respect, but no further advice was volunteered.

About a week after, just before leaving, we learned that the fellows got back about 3 A. M., wet, dirty and full of profanity at being outwitted.

We spent a few days in that locality and had fine shooting.

LEONIDAS.

SOLANO COUNTY, California.

TWO-EYED SHOOTING.

Editor Forest and Stream:

In a late issue of FOREST AND STREAM, I note some observations on the subject of "Two-eyed Shooting," or shooting with both eyes open instead of only one. It seems to be discovered at last, after centuries of profound ignorance on the subject, that this is the only sensible way to shoot, and it is now in order for all who have practiced two-eyed shooting to come forward and crow. I notice that "A Sportsman" from Georgia crows very loudly indeed. He says he is the only man in the entire South who has ever shot in this way, as far as he knows; in other words, that of all the other millions of shooters in the South, he is the only one who has had sense enough to understand the business, "Faithful among the faithless, only he."

This is high honor, indeed; but I can assure the Georgia gentleman that he is not alone in it. I can claim an equal, if not a greater honor than he. I have been a shooter since twelve years of age, and am now almost as old as the hills. I have shot with a great variety of pistols, shotguns and rifles, and have sometimes sighted and fired a cannon. And yet I never fired a shot in my life without holding both eyes wide open. I dare say that the Georgia gentleman cannot say as much as that. If he cannot, then I claim a greater honor than he has. If he can say as much, then I claim an equal honor. Moreover, it is my opinion that I beat him in the honor anyhow, for I cannot, to save my life, shut one eye and keep the other open. I never could do it in my life. If I shut one eye, the other closes simultaneously, in spite of all I can do. Therefore, in my case, "learning comes by nature." At least it is so as regards shooting. When learning comes by nature, it is genius of the highest sort; and genius is much more honorable of all men than mere talent, which has to have the learning driven into it by birch or hazel switches, hard work or long experience. If the Georgia gentleman's two-eyed shooting has not come by nature, I am more honorable and admirable than he, in precisely so far as genius is more honorable and admirable than talent.

It is my opinion that his two-eyed shooting did not come by nature, because he maps out a line of argument by which he reached the conclusion that it is the best way. No line of argument was needed to teach me that, it came the first time I pulled a trigger, by nature or genius. The Georgia gentleman and all other youths should take this consideration into their breasts and cherish it: namely, that find as great a man as you may, you will, if you look around, find some other man somewhere, who is just as great, if not a little greater than he. If they cherish this consideration it will probably prevent them from making humiliating exposures of themselves. Greatness is by no means singular. There's lots of it in the world if one will only look around to find it. It is this consideration which withholds me from making too great a boast of myself, for while it is true that I do not know of another person in the entire South, or elsewhere, who is a two-eyed shooter by nature or genius, yet I am sure if I should boast of it I should find hundreds and perhaps thousands coming forward to dispute with and humiliate me. Therefore I wear my honors meekly, prepared to surrender them at any moment to some greater person who may prove himself to be so.

In regard to accuracy of fire, while I do not claim anything exaltive, yet it is due to science and the small brotherhood of two-eyed shooters to state the absolute fact that I am a good shot with pistol, shotgun, rifle, cannon or even hand-grenade. I have never been with a company of shooters with whom I did not hold a fair and even superior hand, so much so as to excite the envy and secret ill will of many. When a boy the other boys soon refused to go squirrel hunting with me, for it nearly always happened that they came back with nothing, or next to nothing, and I with a bag full. When a Texas Ranger, years ago, I was thoroughly hated by the brag shots of the company, for the reason that they always got left when it came to a trial of skill. One fellow by the name of John Myers quit speaking to me, and has never spoken to me from that day unto this. Fact is I believe he prayed nightly that the Indians might get my scalp. Poor fellow! Some years later the Indians got his scalp, while mine is still on my head. Even now I never go out with a company ducking, quailing or sniping without coming back quite as good a man as the best of them, and often the best. Thus it is that genius sticks to us to the last, while what comes by talent is often forgotten and lost.

If I have talked too much of myself, it is well understood who is to blame for it. The Georgia gentleman provoked me to it. If I have sinned in this respect, he caused me to do it, and is therefore the bigger sinner. If I am to be blamed, he should be blamed the more, and doubtless will be. However, we have both written in the interest of science, and it seems to me scarcely possible to sin in such an interest.

In the same interest I will state that I shoot very quickly—almost the very instant that the gun is brought to the shoulder. If I stop to "draw a bead" or take sight, my gun goes to wobbling, and then I can scarcely hit the side of a house. If I shoot instantly, the gun has no time to wobble, and then I send my lead to the spot I wanted it to go to. As to whether I take sight or not I cannot say. This is certain, however, that I see only the fore sight, and never see the hind sight. To me the hind sight is a perfectly useless incumbrance on a gun. This might not do for very long-range shooting, but it suits all my purposes excellently.

Now let us hear testimony from others on this subject. How do you aim, with one eye or both eyes? N. A. T.

PALESTINE, Texas, May 27, 1884.

HINTS ON SNIPE AND QUAIL SHOOTING.—I never hunt snipe with a dog. I use the dog as a retriever. I hunt snipe down wind, because they almost always rise up wind and come to the gun. When they are wild and are hunted up wind to give a dog chance to scent them, they will rise wild, but when they see you bearing down on them, knowing they must go toward you when they rise, they will lie, and when they do rise they rise toward you and you get your shot. In hunting quail, I never hurry after flushed birds for the reason that birds after being flushed hide. If you hurry after them they will rise in twos and threes, and sometimes most of the covey will take wing again. Let them alone for five or ten minutes, and when you go to where you have marked them they lie so close that sometimes it is a hard matter to make them rise, although you are only a foot or so away. Again, quail seem not to emit an odor immediately on alighting. I have frequently marked them down and hurried after them and I could not find one. Calling off my dogs, I would wait ten minutes and go back and get up the whole covey one by one. And again, you give your dogs a fine lesson in staunchness by making them stand till you are ready to proceed after the birds, then "fetch," and your dogs will not trouble you in their eagerness. I imagine some of your readers saying, "but it is cruel to keep your dog in a constrained position." It is not so. Dogs soon learn to shift position. My dogs will stand for half an hour or more if I do not find them (in cover), and it is not worse to make them stand for five minues. It may seem to be waste of time (when time is limited), but one can fill his bag sooner this way.—SPORTSMAN.

A BEAR IN MADISON COUNTY, N. Y.—Hamilton, N. Y., June 1.—On the morning of May 28 people in the vicinity of Lake Pleasant were startled by a report that, during the previous night, a bear had made a descent from the mountains and attacked a flock of sheep belonging to Farmer Sturges, who lives near the lake, killing and wounding three sheep and two lambs. A hunting party was immediately organized, Mr. Sturges offering a reward of $10 for bruin's scalp. The gallant Nimrods, among whom were two Auburn sportsman, Mr. C. E. Thorne and Dr. C. F. MacDonald, ascertained the line of the marauder's retreat by the aid of dogs, and then divided into couples for the purpose of surrounding and investigating the mountain, where he was supposed to be concealed. After the lapse of about two hours shots were heard in the direction taken by the Auburn sportsmen, and the remainder of the party, hastening to the spot, found the bear's lifeless body stretched upon the ground, the result of a charge of buckshot and a rifle ball from the respective weapons of Messrs. Thorne and MacDonald. The carcass was borne to the hotel, and being placed on the scales, tipped the beam at 309 pounds.

GUN RUST PREVENTIVE.—I wish to call the attention of sportsmen to the cheapest and best "anti-rust" for guns (and any other metal bodies) that exists. It is the cheapest article yet brought forward, can be obtained anywhere that an apothecary shop exists, and is not a "patent" or "proprietary" article, to wit: the common "cacao butter." A few cents' worth will last any sportsman years, as the slightest amount on a metal surface protects it effectually. It is at ordinary temperature a solid, but melts at a slight elevation of temperature, and has been found by European manufacturers of fine surgical instruments as far superior to vaseline and other compounds in protecting from rust, even when these instruments are shipped by sea as far as India, proving entirely sufficient. I use nothing else on my own gun. Had formerly tried one thing after another and given them all up for this simple, easily obtained and cheap article.—C. W. E. (Boston).

BALTIMORE AND WASHINGTON.—Your correspondent has lately returned from a trip to Baltimore and Washington and found the sportsmen of the two cities busily putting in the dull period between times on clay-pigeons (which by the by they complain of not being able to hit) and thus keep in practice for the opening of the "timber doodle" season, as woodcock are affectionately termed in those sections. I am told there are many birds round about Baltimore and Washington, especially the latter city. In Baltimore I learned there is a prospect of a good crop of celery the coming season, which, of a consequence, will make a good year for ducking.—HOMO.

ARIZONA QUAIL WANTED.—Toledo, O., June 6.—Is Mr. Brown, of Tucson, Arizona, to disappoint his friends who hoped to have some Arizona (California) quail through his kindness?—J. B. BATTELLS.

BELATED GEESE.—Concord, N. H., June 2.—Mr. Frank Battles, a well known Boston sportsman now doing business in this city, killed a pair of large Canada geese in the Merrimack to day.

VIRGINIA QUAIL.—University of Virginia, May 30.—We have had a dry spring, and I hear more partridges whistling than I have heard since I came here to live, two years ago.

WHERE TO GO.—At this season of the year the angler, whose impatience led him months ago to look over his tackle and get rods, reels and fly-books in order, is in a quandary. He is trying to make up his mind where to go for his vacation, and is balancing in his mind the attractions of different regions. And it is not remarkable that he should find it hard to make up his mind when we see how many spots there are, within comparatively easy reach, where the trout and the bass are still numerous. Going no further than our own advertising columns, we see noticed publications treating of a dozen different sections. One may obtain maps and guide books of the Adirondacks and may follow in the footsteps of glorious old "Nessmuk," may be his own guide through Northern Maine, over Moosehead, or Tim and Seven Ponds, among the Androscoggins—country of monster trout or may paddle his canoe lightly and easily among the Thousand Islands, where the bass abound and the mighty mascallonge has his lurking place. No wonder it is hard to determine where to go; but whatever the final decision it will be well for him who is about to make an outing to learn all that he can concerning the country he intends to visit. He should read up the guide books with care, and should, so far as possible, familiarize himself with the maps. He should do this, not merely because he desires to know as much as possible about the country he is going into—though this is reason enough—but also because there is a possibility always that he may have to put his knowledge to a practical use. We have known of more than one fisherman in the wilderness who has been "turned" and unable to find camp when he wished to.

Sea and River Fishing.

RHYME OF A BASS.

CLAD in the greenness wherewith hath summer them arrayed,
A clear stream the willows and bending sedges shade,
And spin down upon it slim threads of golden light
Which the quiv'ring wavelets knot in meshes bright.
In this tangled net of sunshine that ne'er holds him,
A bass swims where the swirling flood enfolds him.
As he with lazy fins the yellow meshes breaks,
Above him flits a gay-winged fly in merry freaks,
Of hue so bright and strange that he is half affrighted,
Till in the stream has the silly thing alighted,
Staggering o'er the swirling pools and rippling shallows,
As drunk with sunshine, or giddy, dodging swallows.
Then the bass bethinks him that this gay new-comer
Naught but a blossom is of the air of summer,
A chrysalis the bud, this the gaudy flower,
Drowning here its briefly blooming sunlit hour.
Then up he darts to seize it with a sudden madness,
Born part of hunger and part of that wild gladness
Which moveth all things in this glorious season,
Proving sometimes better, sometimes worse than reason.
But how this gay-clad insect his attack resenteth!
With sting so sharp that none but fiend inventeth!
No blundering bumble bee, no wasp nor buzzing hornet
Hath e'er so pierced his lip, nor e'er so torn it!
Then he spies an angler on the brink above him,
Intent upon him: does he hate or love him?
Ah! The wand he holds nods to him, but restrains him,
To its slender thread belongs the sting that pains him.
To the depths he plunges with his dear-bought treasure,
Wondering in this sport to whom belongs the pleasure.
The coolest deeps, where he has had his life-long sport,
Afford him now no help in this his sorry sort.
In vain he grinds his wounded jaw upon the gravel,
The barbed steel holds, though up or down he travel.
Then tries the upper world where birds and insects live,
To see what aid to him this higher realm shall give;
And as he cleaves the limpid wave he scatters pearls
For ransom, brighter than shine in coronets of earls.
Twice his length he leaps above and in brief survey
Sees trees and banks and man turned topsy turvey,
Their doubles quiv'ring toward him on the troubled stream,
While he shakes his head to loose the torturing fleam.
But naught he knows to try does in this stress avail,
And courage, strength and cunning all begin to fail.
Gasping, he sinks with languid fin beneath the flood,
And slowly stains the current with his oozing blood.
As down he floats, aweary and well-nigh spent of strength,
Across a sunken limb the loose line drags its length.
Last hope! He gathers all his weak remaining force,
And back beneath the branch directs his feeble course.
It holds, nor yields it to the angler's fervent strain;
The swift stream aids his flagging fins—he's free again!
Thanking, as he drifts away, this last entangler,
A happy fish leaves there a not so happy angler.

AWAHSOOSE.

RAINBOW TROUT AND STEELHEAD.

WITH OTHER MATTERS SALMONOID.

I DO not think that we should condemn the rainbow trout too severely for his supposed relationship to the steelhead. The latter creature, as I have known him, is a large trout of ten to twenty pounds weight, and looking somewhat like an Atlantic salmon. He is found in the Columbia River in the spring at the time of the early salmon run, a spent and worthless fish, apparently working his way back to the sea after a mid-winter spawning. The animal is structurally a trout and not a salmon, but it seems to live in the sea, and to ascend the rivers for a short distance to spawn, thence again returning, like a salmon.

In this steelhead condition, the fish bears little resemblance to the rainbow trout, as we know the latter in the streams of California. It is, to begin with, nearly twice as large as the largest of the latter; it is lank and slab-sided instead of chubby, and its mouth and jaws are very much larger than in the rainbow trout.

But in the study of *Salmonidæ*, we have learned how deceptive are differences in looks and differences in habits. The trout adapt themselves with wonderful readiness to differences in their surrounding, and these surroundings in turn react on them and change their "looks."

On careful comparison of the rainbow trout with the steelhead, the only structural differences which appear are these two: The rainbow trout has a mouth which is small for a trout, while the mouth of the steelhead is large, the jaws extending well behind the eye. In this regard, there is a marked difference between the largest rainbow trout (McCloud River) I have seen and the average steelhead, the caudal fin in the steelhead is truncate while in the trout it is lunate.

But in all species of trout, the mouth grows larger in old fishes and is largest in spent males, and in the same way the caudal fin becomes more truncate with age.

I do not know the young of the steelhead, nor do I know any character by which it could be distinguished from the rainbow trout.

On the other hand, if the rainbow trout ran into the sea, and there grew more rapidly, changing its appearance and habits as other fresh-water salmonoids do when they get into the ocean, they ought to make exactly such a fish as the steelhead.

My present belief is (always subject to change on the introduction of more evidence) that the steelhead (*Salmo gairdneri* Rich.) is a sea-run form of the rainbow trout (*Salmo irideus* Gibbons), and that the two are not really distinct species, but forms of one species. If so, the name of the rainbow trout should be *Salmo gairdneri irideus*.

To what degree the two forms may mix, I do not know. It is apparently certain that the great body of the rainbow trout of California and Oregon do not descend to the sea, and consequently never become steelheads, and I do not think that the steelhead matter has any great weight as an objection to the introduction of the rainbow trout into Eastern waters. Whether the species in the East will stay where it is put or go off somewhere else, we can only find out by experiment.

Something similar to the change into steelheads seems to take place in the other Pacific coast trout. In Puget Sound the red-throated trout (*Salmo purpuratus*) abounds everywhere in the sea as in the brooks, and large specimens (25 pounds) are sometimes taken, which seem to be the "steelheads" of that species. All of these spawn in fresh water; hence, they must be in some degree migratory.

Again, the "Dolly Varden trout" or charr (*Salvelinus malma*) is ordinarily a brook fish, in size, habits and appearance altogether similar to our Eastern brook trout. But it is common in the salt waters of Puget Sound, and specimens weighing 11 pounds have been several times brought to me by the Indians at Seattle and Victoria. These large fishes are silver gray in color; they live in the sea, and consequently must run up the rivers in the spawning time; but of their identity with *Salvelinus malma* there is no sort of doubt. They are, I take it, the "steelheads" of the species.

Another case of the same sort, if the matter is correctly understood, is that of the Canadian sea trout (*Salvelinus fontinalis immaculatus*). These seem to be sea-run brook trout, who have grown so large and become so peculiar in their habits, that it may be best to recognize them as a distinct subspecies, as we do the landlocked salmon. They are the steelheads of the brook trout, and their progeny, if planted in small inland brooks, would, I think, in time adapt themselves to circumstances and become brook trout again.

I am not much of an admirer of the rainbow trout, but I do not see in what important respect it is inferior to the European brook trout (*Salmo fario*). In technical regards the two species are exceedingly similar. They are "as much alike as two peas," nor do I know of any difference in habits.

A finer fish than either of these, larger, gamier and handsomer, is the species which I have called the red-throated trout (*Salmo purpuratus* Pallas). This is the trout of the Rocky Mountain region and the Great Basin, of the Yellowstone, of Utah Lake, of Lake Tahoe and of the Upper Columbia. In the FOREST AND STREAM it has been called Clarke's trout, but I submit the above "common name" as one preferable for general usage, Lewis and Clarke had little to do with it. It has been named *Salmo clarkei* and *Salmo lewisi*, to be sure, but it was well described and well named long before the days of Lewis and Clarke. In all specimens I have seen of this trout, there is a deep red blotch at the throat, between the branches of the lower jaw. This was noticed by Pallas, and it may have suggested the name "*purpuratus*" (empurpled) which he gave the species.

I believe that this trout is better worthy of experiment for fishculturists than either *Salmo fario*, or its American double, the rainbow trout.

While my pen is in this matter I would like to say a word as to the relative merits of our American brook trout (*Salvelinus fontinalis*), and the brook trout of northern Europe (*Salmo fario*).

In the English usage of these names, our trout is not a trout but a charr, and I take it the highest praise that can be given to any salmonoid fish is to say that it is a charr. That is the superlative of trouthood. The genus *Salvelinus* stands at the head of the series. In beauty, in gracefulness, in wariness and in gaminess all the true charr seem to surpass any of the trout. They are less hardy, as a whole, and inhabit only the coldest and purest waterst. Thus, where both charr and trout are found, the latter occupy a much wider range.

The red charr of Europe, the sälbling or ombre chevalier (*Salvelinus alpinus*), and its near relative, our Rangeley Lake blueback (*Salvelinus oquassa*), are delicate and beautiful little fishes, less voracious than the average trout. The least graceful and most voracious of all the true charrs is probably our American brook trout. He is more hardy and less delicate than the ombre chevalier or the blueback, but leaving these ideal forms aside, in beauty and grace none of the true trout approach him.

DAVID S. JORDAN.

INDIANA UNIVERSITY, June 2.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—V.

WHEN our neighbor appeared next morning with the lumber he asked about the varmints, and when told they had failed to come and see us, said: "Well, boys, guess you're all right now, for they hardly ever come after the second day. What's to be done to-day, fish? I'll row a couple of ye to-day, and show ye the good places." (Mem.—He charged $2 at the final settling up for showing the boys the good places that day, rowing thrown in.)

While getting things in readiness for the day's fishing we had a chance to look Brother M. over and size him up, not having had time in the hurry of putting the camp in shape to do so before. His age, he said, if I remember rightly, was past fifty years. He was nearly 5 feet 8 inches in height, broad-shouldered, solidly built from the ground up, and stood firmly on a pair of large, well-shaped, muscular legs. His arms were models of strength and muscle, and his hands, large and sun-browned, looked—for lack of a better comparison—like a pair of "Pride of the West" hams. A full, deep chest, with this development of limb, marked him a man of great strength and a bad customer to deal with if it came to a matter of blows. A pair of keen gray eyes, under shaggy brows, a full, reddish brown beard, slightly grizzled, and a shock of hair that had originally been a crushed sweet-potato color, but now tawny and weather-beaten, completed his make-up. This was neighbor Merrill, in physical development a cross between a buffalo bull and a cinnamon bear, and with a voice to match. He was companionable, too, and a great talker; in fact, as Ben said, "Blowin' his horn was one o' his best holts;" but we had no trouble in our dealings with him, as he filled to the best of his ability all his agreements with us, and we treated him squarely in return. By his own admission he had been one of the "bhoys" in days when he was younger and living back in "York State," having trained in the John Morrissey gang before that sweet-scented citizen aspired to Senatorial honors. The finish of many a tough scrap with the pugilistic fraternity had found him on top, but he had tired of these empty honors, and moved up here into the very wilds of Michigan to bring up his boys in a pure atmosphere, away from the wiles and temptations that had encompassed their paternal parent in his younger days; away from evil companionship and whisky. Whatever other shortcomings neighbor M. may have been possessed of, I honored him for his motives in this, and respected him for the example he set them by not touching a drop of the cursed firewater himself, and I trust his boys will honor this teaching and grow up to be useful and respected citizens of the great Wolverine State.

But we were impatient to be off, and as the morning had cleared up with promise of a beautiful day, we left the camp in the best of spirits and ready as Ben said, "for a fight with anything from a pound up that wore fins."

Our camp was located in the bight of a small bay on the southeast shore, from which point we could command a full view of the lake with the exception of perhaps three miles of the lower end, and from here, before we start out for our first day's fishing, we may as well jot down some of its

features as seen from where we stood and as afterward learned in different excursions from camp.

Sweeping around to the left the eye followed the shore northward to a point where the lake narrowed to about three and a half miles wide, from whence it trended off northwest and down to the outlet, holding a width of three to four miles. Around this point and well down to the head of Big Black River, the outflow, is a narrow strip of water running back into the woods, a matter of an eighth of a mile, rush fringed and shallow, that is dignified by the name of Sturgeon Bay, and just at the mouth of this little bay flows in Little Black River, the name suggested no doubt by the very dark color of its waters. Up lake to the right of camp the shore swept around in a graceful curve almost to the extreme head of the lake, the dark green background broken only in one place by a rugged ledge of rocks a hundred yards or so in width, cropping out of the hill nearly flush with the water's edge a short distance above the road coming in from Merrill's place. This ledge, Merrill said, extended down the lake near the center in a straight line nearly to the point where it narrowed, under water from where it cropped off at "the rocks," a depth of fifteen to thirty feet, but readily traced in a boat when the water is quiet. On either side the water dropped off deep, and along this sunken ledge he said was to be had some extraordinary bass fishing later in the season. He forgot, however, to apprise us of the existence of this bass ground until the day before we broke camp, but as it is not in the nature of the "Kingfishers" to nurse a grudge, we have forgiven him long since, and even at this late day beg to tender him our thanks for the information so tardily given, as some of us will no doubt take a notion to pay Black Lake another visit.

Nearly the whole of the southwestern shore line is fringed with a scattering belt of bulrushes that grow out into the lake from a few feet to a hundred yards, and out from the margin of this belt from 50 to 200 feet runs a bank, not rocky, however, which in places is ten to fifteen yards wide, in others only a few feet, and under water from one to three fathoms. This bank, or reef it might be termed, may be traced when the lake is quiet, nearly its whole length by the "musrat grass"—as Merrill called it—and aquatic plants that reach up in many places an inch or two above the water. Along this streak of submerged grasses and water weeds is the abiding place of that long snouted cannibal, the pickerel, and here, too, may be occasionally found the despotic king of all these northern waters, the mighty muskalonge, from whose path within the bounds of his chosen territory all fish must stand aside.

Just out in front of the camp, Merrill pointed out the spot where the year before our friend Hughes had smashed his rod on one of these monstrous fellows without as much as the fish finding out that Hughes was there.

"Yes, sir," he went on, "Mr. Hughes and another gentleman of their party—and I tell you boys that man Hughes is a gentleman—Hughes and the other gentleman—I forgit his name—was a fishin' that day an' I was a rowin' for 'em. Right out there 'longside o' that grass, Hughes hung a pickerel, mebbe a four or five-pounder, an' was havin' a mighty sight o' fun with him, an' jest as he got him wound up where we could see him, another fish that looked nearly as long as I am made a rush an' grabbed him, an' that's the last we seen o' that pickerel an' some o' Hughes's line. He jest made the water bile as he turned 'round an' started off, an' that pole o' Hughes's wasn't no more 'n a bulrush to that fish. No, sir, he jest broke it up like he would a bulrush, an' Hughes all the time a tryin' to hold him. That's jest where he missed it, an' he felt mighty cut up about breakin' his pole, but I tell you, boys, them little minny poles is no 'count fur them big muskylunge, an' the hull trouble was Hughes didn't know it. There's some mighty big ones in this lake an' you'll see some of 'em 'fore you git through, mind what I tell you."

This smacked of a very sizable fish story, but as we had begun to find out neighbor M.'s capabilities for constructing big yarns out of a mere handful of material, we left a wide margin on this one for shrinkage, and remembering the string sent us, were prepared to entertain others that might follow, with a due allowance for the old mossback's fertile resources in presenting the points and avoiding the rough places in a good fish or bear story. However, what we afterward saw with our own eyes convinced us that there were "some mighty big ones in this lake," and the tale, shorn of its embellishments, of Bro. Hughes's disastrous encounter with one of these great fish was duly credited to our neighbor as a stray case or truth.

In Merrill's pet boat, a beautiful little double-ender—"one o' them weather-boarded boats," as Ben expressed it—Dick and I took our way down shore, intending to make the circuit of the lake by nightfall if possible, and study the water carefully as we went around.

The other boats headed for the Rocks, where Merrill said "they could ketch jest as many bass as they wanted."

Clear down to the point where the shore took a turn to the northwest Dick and I fished slowly and diligently and carefully, without a solitary nibble to disturb the evenness of our pulse. This was not encouraging.

Here we concluded to let the lower end of the lake go over for another day, and heading across, a pull of nearly four miles brought us into the shoal water near the further shore. I was at the oars pulling leisurely in toward a clump of bulrushes where we thought perhaps we might find a bass hunting around for a morning meal, when Dick, who was facing the shore, whispered excitedly, "Look! Look yonder, quick, at them deer." I turned quickly, in time to see two graceful does leap lightly over a fallen tree near the edge of the water and disappear at a couple of bounds into the woods. Dick said there was a buck with them, but I was too late in turning to get a sight of him. They had come down to the water for their morning drink from the plains just back of the belt of woods bordering the lake, and were standing in the water when Dick first saw them.

The rifle was lying alongside of me on the thwart but I never once thought of it till Dick said, "What did you bring that rifle out for, to shoot pickerel?" I really had brought the gun along to try a shot at a loon, three or four of which had been laughing at us from a safe distance all the morning, but I am afraid that had I got sight of the deer in time, and thought of the rifle, the blood of my ancestors would have asserted itself and one of those innocent creatures might have come in violent contact with a .44-caliber bullet, in which case I would have been liable to a fine for infracting the game law of the great State of Michigan, besides feeling "meaner 'n a yaller stray dog" over it for the rest of the trip, for no sportsman likes to have the fact staring him in the face that he has broken a law of the land. Still, when opportunity offers for a shot at a deer, the temptation is great to shoot, so great that few of us can command perfect control over the trigger finger even though it be the middle of July and the timid creatures in the red coat. Who of us all that claim kinship in the brotherhood of sportsmen and anglers will gainsay it?

We pulled ashore to stretch our legs a few minutes and—I may as well confess it—with a sneaking desire possessing us to get another sight of the deer, although they were by this time probably a half mile away back on the plains snorting a wondering protest at being frightened from their morning drinking place.

We shoved out after a short rest and headed up the lake, Dick saying naively as he took his seat at the stern, "Well, those were the first deer I ever saw in their native element!" his Scotch ire flaming up in the same breath with, "What the divil are you laughing at now? you 'pear to be troubled with a protuberance of spirits this morning; better soak yer head in the lake awhile, it might take some o' the hilarity out of you." This caused the hilarity to break out afresh, but Dick's habitual good humor soon asserting itself he "jined in" with his high tenor and for five minutes the neighboring woods rang with a first-class laughing duett. Harmony was restored and quiet settled on the waters when he lit a fresh pipe, put on a live frog and made a long cast out to the edge of the deep deep water, remarking as he sat down, "I'll jest feel fur a bass out there." No bass being there in a feeling mood we pursued our way, keeping a shoreward eye for another deer, but all within miles of us had, no doubt, taken the alarm and "struck for tall timber," as we saw no more that day.

Along this shore we found shallow water extending out from twenty yards to nearly half a mile in places, the bottom hard sand and pebbles, and nearly free from grass or bulrushes until well up to the head of the lake.

The water gradually deepens from the shore to the outer edge of this sandy bar, varying in depth along this line from 10 to 20 feet. Here the bar pitches suddenly off to an unknown depth, the line being plainly marked by the difference in the color of the water, that outside having an almost inky black appearance, and all that shoreward a much lighter, but yet very dark hue. This body of water is rightly named Black Lake, for verily it is the "lake of the dark waters."

Along the break of this bar, straight across from our camp, the Hughes party had found their best bass fishing the year before, taking a great many of large size, but now the fish seemed to have "hied themselves," as Ben would have said, to parts remote; for here were Dick and I, two old fellows that thought ourselves "purty middlin' smart bass fishers," fishing with the loveliest of speckled frogs, toothsome to bass and pickerel alike, and not a solitary tug at the lines to gladden our hearts the livelong morning. We tried a Hill troller, a Chapman troller and a Buel spoon, but they were not spoony enough to be fooled by any such glittering shams.

Dick finally said, "I don't believe there's a durned fish in four mile of us, an' if there is, they're like some o' my customers" (Dick is a famous caterer to the public stomach in the matter of pies and things), "a little too facetious in their appetites to know when good things are offered to 'em." Dick had hooked on to the wrong word again, and I was forced to nip an incipient snicker in the bud by seizing the frog bucket and bending over the side of the boat under pretense of refreshing the croakers by sousing them in the lake, and it was only by a mighty effort that I smothered a rising snort and prevented another temporary coolness.

[TO BE CONTINUED.]

THE COLOR OF LEADERS.

BY DR. JAMES A. HENSHALL.

I HAVE been much interested in the various articles by practical anglers on leaders, rod-joints, reel-seats, etc., that have appeared during the past few months in FOREST AND STREAM, and as the subject seems to languish, lately, I wish to add my mite.

As to leaders and snells, I do not think it makes any difference, practically, as to their color. The greatest desideratum, it seems to me, is to have them as fine as possible, consistent with the strength required, and this is not much with a flexible rod. A snell, or leader that will sustain a dead weight (out of water) of a pound, or even a half pound, is sufficient for black bass or trout fishing with a suitable rod; for the amount of strain exerted by a fish on the rod and tackle is very much less than is popularly supposed.

The praiseworthy experiments to determine the color of leaders least visible to the fish as described by some of your correspondents, however commendable, are sure to end in disappointment; such, at least, has been my experience. Experiments to this end have been made by practical anglers for many years with no other result than to show that the finer the gut the better, without reference to color. My own experiments in this direction have not been few, and I have demonstrated, to my own satisfaction at least, that any color of leader or snell will answer equally well, from hyaline to black, though I confess that I am partial to a slight bluish stain, or mist color, and perhaps without any well-defined reason, except that it *ought* to be least visible to the fish.

But when we enter the province of speculation and conjecture, and try to see for the fish, or in other words, to measure their visual capacity by our own, we are doomed to disappointment, though we bring to our aid all the known resources of the science of optics. I lately read, somewhere, that an English angler declared that the salmon took the fly under the delusion that it was a shrimp, because while said angler was beneath the surface of the water, the artificial flies on the surface appeared to him like shrimps. To have made some show of proving his statement he should have first demonstrated that salmon could be taken with shrimp bait as successfully, and in the same situations, as with the fly. The only way to experiment with profit, in this direction, is to experiment with the fish themselves, otherwise our efforts will be like the play of Hamlet with the melancholy Dane left out. The sense of sight in fishes is but little understood, as is, indeed, the anatomy of their visual organs, which fact precludes all analagous reasoning from our own standpoint, alone. I have satisfied myself, however, that they see as well in their own element, perhaps better, than we in ours.

That the color of the leader is not important is very evident when we reflect that the boy with line of wrapping cord, red, white or blue, or the angler with line of twisted strands of black sewing-silk, to which the hook is affixed with leader or snell, is as successful in taking trout or black bass with bait, as others with lines of the most approved colors. And one of your correspondents affirmed that he was successful with a leader stained black, which, likewise, accords with my own experience in fly-fishing. Sharks do not hesitate to take the bait even with the huge hook and chain and swivel accompaniment, nor do codfish, and other marine fishes, refuse the bait because of the large hooks, wire snells, or coarse white lines; yet it is to be presumed that their discernment is as acute as that of a brook trout.

Still, though any color may answer, I prefer lines and leaders of neutral tints as being more in accordance with the eternal fitness of things, than for any other good reason. I have used, with success, snells and leaders of the finest silver suture wire, for trout and black bass, but, practically, they are not pliable enough, and are too heavy.

On the whole, then, I think we shall have to be content with our leaders and snells as we find them to-day, simply selecting those that are the finest, roundest, and most perfect, remembering, meanwhile, that a sight of the angler himself, is more fatal to successful fishing than a display of the coarsest leader, or of the most *outré* in color.

CYNTHIANA, Ky., June 6, 1884.

NEW JERSEY PIKE FISHING.*

NEVER caught a pike! Well, unless I am much disappointed there will be a dozen in this boat in two hours, and not of my catching either. We can't help getting them. Everything is just right. The pond is not fished much. It is large enough to give room for all sizes of fish and for their food, but not so large that the fish can get into out of the way places where one may not find them. There are deep waters for the big fish, flats three or four feet deep for the medium-sized ones, and broad, weedy shallows for the small fry.

The day is all we could ask. The gentle south wind just ruffles the water, making a screen between us and the fish. The thin clouds keep off the glare of the sun, without being threatening or gloomy. It is seldom good fishing in a bright sun. It makes the fisherman show too plainly, and throws strong shadows of him and his pole over the water.

Keep a sharp lookout for the path which the miller said would lead to the cove where the boat lies. I spent half an hour trying to find the place when I came here the first time. But I caught my share of sixty-five fish in spite of the lost time.

The boats on these ponds in Southern New Jersey are mostly very simple affairs, mere shallow boxes, and their oars are made from slabs by trimming with an axe.

Ah! there is the cove, and the boat is as I said, though the oar is better than is generally found. The boat is full of water, as usual. I never have found a boat in New Jersey that did not have to be bailed out before it could be used.

Fix up the tackle now, while I ply this tomato can. This bailing of a boat is a curious process. You dip and dip, and seem to make no impression, then, just as you think you will never get through, you find that the water is almost gone.

What hook would I use? Why, that medium sized one, as big round as the end of one's thumb, with a ring on the shank, and six inches of iron wire fastened to the ring. That hook has caught nearly one hundred fish. Some people like two hooks, one a little above the other, but I have found a simpler rig to be the surest. Never fasten the hook right to the line. A big fish may bite it off in two seconds. The only time I have tried it in ten years I lost hook and fish on the second bite.

Now for the bait: Cut a piece out of this white perch; make it like a thin, slender isosceles triangle, two and a half inches long with half an inch base, and stick the hook through quite near the large end. When it is trailed through the water it will look quite like a little fish. When we get a small pike, a piece of his white underneath part will make the best possible bait. This is what the poet, Holmes, says of it:

> "There's a slice near the pickerel's pectoral fins,
> Where the thorax leaves off and the venter begins,
> Which his brother survivor of fishhooks and lines,
> Though fond of his family, never declines.
>
> "He loves his relations, he feels they'll be missed,
> But that one little tid bit he cannot resist;
> So your bait may be swallowed, no matter how fast,
> For you catch your next fish with a piece of the last."

Now we are all ready to get aboard. Take a seat in the bow, I'll take the stern and scull. Throw in as soon as the water is two feet deep; keep the line a little shorter than the pole, and let the bait drag through the water as a fish would swim; keep it six or eight feet off from the boat. The fish won't mind us; if we go over a pike he will only sail out to the bait. Shake the pole a little, or alternately raise and lower the tip. This makes the bait wriggle and run in a taking way. Except in very deep water don't get deeper than a foot or two, and if the weeds are thick keep very near or on the surface. That heavy sinker near the end of the line keeps the bait down and enables one to have better and quicker control of it. Steer the bait through any openings in the lily vines, the pike are apt to lie there.

Watch the bait, or the place in the water where it is; if a fish takes it he almost always make a swirl. If anything stops the bait it may be a lily stem, or it may be a pike. A little experience will tell what is the cause. Bait stopped? That is only a weed; pull steady; now it is free. Ha! that was no weed. Drop the pole a little. What a pretty swirl he made. Now tighten the line gently on him. Feel him there? He thinks the little pull of the line is the struggle of his prey. Give him about half a minute to get the bait well into his mouth. When he moves off jerk sharply against the way he is going. Now! Lift him quickly. Ah! he's gone over the other side of the boat. Never mind, he was rather small and there are plenty more. In hooking a fish, strike sharply, but afterward lift steadily, though rapidly, so that the fish will just swing into the boat or into your hands. Don't seize the fish, but the line near—, another bite—Oh! don't jerk the bait right out of his mouth. Slack the line instantly, then gently tighten it and wait—there, he has it again. That's right, give him time. If he moves directly away, jerk straight up. Try to draw the hook back in the corners of his mouth. Now pull. Well landed for No. 1.

Now we will have a good bait from him. Several in fact. It don't spoil him any. It just takes away a little of the thin part.

Throw out there and draw past that old stump. See that swirl where a fish jumped at the bait as it left the water. Always draw out carefully in a good place. A fish may be following the bait, deliberating about it, and finding finally that "Blessings brighten as they take their flight," may jump just as it begins to move rapidly away. However, try for him again. Ripple the bait along the surface and look out for a big flounce. There! My! how he made the water fly.

* The pike of Pennsylvania and New Jersey is the same as the pickerel of New York and New England.

Strike quickly now. No; he's off. Never let a fish run to the end of the line without doing something. Either pay out line, or better still, strike quickly. If you just hold still he is not stopped sudden enough to set the hook, yet he thinks something is the matter and lets go the bait.

Put on a fresh bait and give him another chance. Never use a chewed or ragged bait if a good one can be had. There, he has it again. See how the water boils up as he works his fins. That is a sure sign of a large fish. Now strike. Don't try to lift him; don't get his head above water. Let him run a minute, but keep a tight line. Now tow him round to me and I will take a short hold on the line and lift quickly. There he is, and a big one, too. He is safe, but the hook fell out as soon as he was fairly on the bottom of the boat. Examine now his big jaw. See that long slit made by the hook. It would never have torn past his bony lips, but the hook could easily have been shaken out if the line had been slackened or the fish had floundered two seconds in the air. What will he weigh? Say a pound and a half, a first-rate fish.

And this is another good one; no small fish are around here. If there were, those big fellows would have some dinner.

Now, throw out beyond that group of lily leaves. Work carefully, for the water is clear and shallow. There, that is just right. And see that little swirl ten feet off, and this V-shaped ripple going toward the bait. More slowly. There, he has it.

But the water is too shallow here for very large fish. See these small ones moving off as the boat nears them. Let us go across to that cove on the other side. I hear the fish jumping there, and we may get a few on the way over. If anything bites, strike quickly, for we will move too fast to allow time for chewing. Ha! well hauled in. There—no, we were too quick for him, and as he was well lifted from the water, he will probably not bite again now. But we will mark the spot, and come around again in a few minutes, after he has had time to recover. He is pretty sure to bite again. This willingness of the pike to bite a second time, if unhurt, renders a tough bait, such as we are using, of great advantage. For if you jerk the bait out of his mouth without hooking him, you keep your bait and he loses it. He wonders what became of it, and how it happened to get out of his tight grip. Therefore, when he sees it again he is likely to take it more quickly and savagely than at first. If, however, you use a tender bait and leave it in his mouth, he will not bite again till that morsel is stowed away.

Now let us try along this deep channel. If any fish is here, he is a big one, and lies deep. So put on a large bait, and fish well under water.

Can anything be nicer than this gliding along, over the slow-moving, clear, coffee-colored, cedar swamp water, with the pine-covered banks on all sides. This is practically the primeval forest. We are fishing as the Indians might have done had they possessed our tackle. What a peculiarly delightful motion this sculling is. No noise, no apparent effort. There is no need of any hope of success to make our situation all-satisfying. But we have the hope, and well founded too. What's that, a snag or a fish? A fish. Then wait till he runs. He ought to be a big one, for this is very deep water. Whew! how he rushes. Don't pay out any line, keep the point of the rod down when he comes to the top of the water. Hold him back from those weeds. Now bring the line round slowly. There he is, a good three-pounder. Knock him on the head to stop his struggles. See how broad and deep he is, and what a paunch he has. He must have just breakfasted on a fourteen-inch relation.

Now let us turn toward the landing place, for the sun is too bright for further fishing. Straighten out the fish so that we can see them. Sixteen in all. One of three pounds, two over one pound, none of them very small. That is first-rate for a beginner. T. K. B.

FISHING AT BUZZARD BAY.

HOW often information, a direction or a letter published in your valuable journal will give great enjoyment to its readers. Let me thank one of your correspondents, "The Doctor," for pleasant fishing jaunts, and many happy days spent among the good kind people of Cape Cod. See FOREST AND STREAM, Oct. 24, 1878, page 245, correspondence headed "Bass Fishing at Cohasset," signed "The Doctor." When I read that very excellent letter it fully determined me to make the same trip. I never filed away that number of FOREST AND STREAM; it is before me now. But not till the summer of '82 did I carry out the full instructions so carefully and truthfully given in "The Doctor's" letter. I took the Fall River boat to Fall River, thence by Old Colony Railroad to Cohasset Narrows (now called Buzzard Bay) via Middleboro; stopped at Parker's comfortable hostelry; saw the fish caught as "The Doctor" describes; did not catch any ourselves, not having proper tackle for striped bass and bluefish, but determined to return next summer properly armed.

We, still following "The Doctor's" directions, took the train down to that quaint old fishing town Provincetown. Fresh salt breezes, hearty appetite and good people made the trip a joyous happy one. The outlook from High-pole Hill is indeed charming and very extensive; white breakers line the shore, pretty Cape Cod Bay, sailing vessels, and the blue ocean form a delightful picture from that eminence; and if you are a single man be very very careful of the bright eyes of those smart and intelligent young ladies of pretty Provincetown.

On my next trip to Cape Cod we varied the route, and found it a very pleasant one. July 17, '83, found me aboard the magnificent steamer the Pilgrim. A joy was in store not anticipated by me. Down the wharf came Cappa's splendid band, followed by that gallant body of gentlemen the veteran corps of New York's favorite Seventh regiment. The Pilgrim's great paddles turned, rounding the Battery, boat and corps flags flying.

Next morning we parted with the gallant corps, taking railroad to the beautiful city of New Bedford, thence by steamer to the bluffs of Martha's Vinyard, where if you wish to stop a while, pure air, comfort, elegance and good society await you. On again by steamer to quiet, sea-girt, pleasant Nantucket. Another steamboat ride carries you to Wood's Holl (salt-water fishing is said to be good here). Then a short railroad ride brings you to Buzzard Bay. Now for fish at last. Take a short stout rod, with 600 feet of cable laid line on a large multiplying reel, go to the railroad bridge, the tide rushing rapidly out to the bay, let out 100 or 150 yards of line (after baiting a strong hook with menhaden or small eel) and when a bluefish bites, you will think for a moment that a portion of Plymouth Rock has struck the end of your rod: it will test your rod and reel, and well try your strength to walk to the beach at the end of the bridge and reel your fish in against the rapid waters, combined with the power of a nine or ten-pound bluefish wishing to go the other way. And what joy (providing you get the fish in) to see his bright sides lie on the white sandy beach. It is rare, exciting sport, as "The Doctor" truly writes. His remarks are also quite correct about the striped bass fishing to be had, also off the same bridge.

Buzzard Bay is beautiful and healthy, with fresh salt water breezes constantly blowing over the cape. Yachting is excellent. Sharks can be caught if parties like that kind of fishing. We caught quite a large one off Wing's Neck. A pleasant visit can be made to Onset Bay (close by), where is held the annual camp meeting of the Spiritualists.

How I should like to see "Kingfisher" on that bridge at Buzzard Bay, with rod and reel and 100 yards of line out in the rushing, roaring out-going tide; a ten-pound bluefish on his hook, rod bending and reel buzzing. I fancy hearing him say, "Well, well, well! I only wish Ben, Dan and Frank were here. Old Massachusetts for ever!" I hope that "The Doctor" may see this note and know of the pleasure his letter has given to at least one of your readers.

WILLOUGHBY.

SPORT AT BLOOMING GROVE PARK.—On May 29 the evening train on the N. Y. L. E. & W. Railway carried about fifty members and guests of the Blooming Grove Park Association to Millville, where teams met them. Seventeen being the limit, that number of the party drove up to the club house, seven miles away, leaving the others at Mr. John Deming's comfortable and delightfully clean and tidy house, which is especially fitted for accommodating the club members who choose to remain all night. Decoration Day, all having arrived, some went fishing for trout, others walked over to the breeding park, some joined in the rifle shooting contest for a badge, others in shooting clay-pigeons ("mud birds" as Dennis called them) also for a badge. (Scores given elsewhere.) Our worthy president, H. W. Nason, captured both prizes, then "went for the boys" in fly-casting, but there met his equal in Mr. Frank Martin, who cast two feet further than any of the other contestants, Mr. Nason coming out second. There were some sweepstakes and private matches, and any amount of fun of various descriptions. Evening brought its indoor sport. Exchange of stories and very little in the line of absolute feats. As far as could be judged all were pleased with the housekeeping and gratified at John M. Stellenwerfs method of attending to the wants of members and guests. On the 31st, 20,000 trout fry, 400 yearlings and two year old trout were turned out in the streams of the preserve. Fly-casting.—D. E. Martin 58 feet, H. W. Nason 56 feet, A. J. Post 53 feet, T. W. B. Hughes 50 feet, W. D. Baldwin 48 feet, W. Fielder 48 feet, W. H. McCord 45 feet, J. A. Van Elden 45 feet, G. Hodgman 25 feet. Afterward Mr. John M. Stellenwerf, the superintendent, in a private trial of five minutes, cast 82 feet.

FISHING IN TENNESSEE.—Memphis, Tenn., June 6.—It is true, we catch no such different varieties of fish as are caught in those beautiful lakes of the North, but for black bass and speckled perch, I hardly think any lake can beat those in our vicinity. Blackfish Lake is situated due west of Memphis in the State of Arkansas, twenty-five miles from Memphis, on the Little Rock Railroad. Its name is derived from a peculiar kind of perch caught there, which is perfectly black, and a gamy little fish. I have seen black bass caught with line and troll in the lake, weighing, on pocket scales, from seven pounds down, also fine specimens of speckled perch, weighing as high as five and one-half pounds. Last season two friends and myself fished in this lake constantly and our largest catch on a two days' fish, using Skinner's fluted troll and cut bait (as we could not conveniently procure minnows) was two hundred and sixty pounds of game fish. This, I think, your readers will admit to be a splendid catch, considering we did not have live minnows. I have not been able to visit the lake this season, owing to the extreme high water, but am making arrangements to go at the earliest possible moment. Have heard of some very fine catches made this year, the parties reported black bass plentiful and biting well. We will let you hear from our party when we return, for we certainly expect to make a large catch.—J. S. K.

MISSISQUOI MARSHES.—Highgate, Vt., June 2.—The writer returned Saturday from a trouting expedition in the Megantic country. The cold weather and high water somewhat interfered with our sport, though our knowledge of the ground enabled us to make a fair catch of *S. fontinalis*, which opened the eyes of the natives. Mr. Parker Leach, of this town, and Messrs. Louis Cabot and Harry Dutton, of Boston, have leased the Bullard marsh, which lies on the south side of the mouth of Missisquoi River in this town. This gives the club complete control of the Missisquoi marshes, and they intend to protect these grounds during the close season. Our thoroughly-determined fish warden, Mr. F. H. Atherton, of Waterbury, Vt., up to May 10 had seized in this vicinity nine trap nets, three fyke nets and seven seines, and has succeeded in breaking the backbone of the gang of outlaws who have been infesting our waters. His task has not been an easy one, but his indomitable courage has given him victory in every encounter with these fish pirates, and he will pursue his work until he has completely cleared out and stopped this illegal fishing, and I trust that the sportsmen of this State will, in a suitable manner, give a public recognition of his services at an early date.—STANSTEAD.

SPORT IN CALIFORNIA.—San Buenaventura, Cal., May 24.—Our sportsmen are all turning their attention to fishing now. We have good fishing in the ocean, but few indulge in it. The Ventura River, just at the edge of the town, is a fine trout stream, and many an angler has wended his way toward its source and returned with a fine basket. As a matter of course, we have a few trout hogs here. One of them caught nearly 300 in one day. The Santa Clara, Sespe and Piru rivers, or creeks, in this vicinity also, contain plenty of trout, especially the Sespe (pronounced Ses'-pee). No very large trout have been caught, most of them averaging from six to ten inches. Our deer killing season opens in July, I believe. We have an abundance of them in some places. I know of a place within two or three miles of this place where I can get one or more almost any day, and will as soon as the season opens. But for all that they are not as "thick as hops" about here.—TYPO.

MOSQUITO AND BLACK FLY.—We have heard many commendations of the "black fly cream" prepared by A. S. Hinds, Portland, Me., as an effective insect repellent. The cream is advertised elsewhere.

MR. HOAGLAND WILL WELCOME YOU.—In response to the inquiry of a correspondent we print the following from the New York *Sun* in reference to the Pequest, a stream which traverses the picturesque valley of the same name, in the county of Warren, New Jersey: "For many years this stream has been the favorite resort of a few fishermen, who have secretly known it as one of the best trout streams in America. The hospitality of the good old farmers along the stream, with but few, if any, exceptions, is proverbial. They seem to try to outvie each other in their efforts to make the sportsman happy while he is among them. The stream, as it passes through the property of Mr. Theodore Hoagland, located about midway in the best fishing ground, is simply alive with trout of unusually large size. Two gentlemen are said to have taken 289 trout in one and a half days' fishing this spring, the smallest weighing eleven ounces and the largest three and a quarter pounds. The trout here seem to be almost inexhaustible, owing to the many large springs which empty themselves into the main stream just at this point, thus affording an excellent feeding ground. Mr. Hoagland is a wealthy, intelligent, amiable and hospitable farmer, with a jolly red face, indicative that he is at peace with himself and all mankind. Having comparatively retired from active farm duties, he loves to devote his attention to the sportsman. He watches the stream for hours in the hope of seeing an angler enter his grounds, for his most exciting amusement is to observe an artistic fisherman cast his fly, and he lends excitement to the sport by his demonstrative actions when the artist succeeds in hooking a large fish. Mr. H. is rather old to fish himself, but he entertains right royally, and expresses himself as being only to happy when a real jolly sportsman favors him with a visit. Probably the best and pleasantest way to reach this stream is by the way of Hackettstown. I have no doubt that the proprietor of the American Hotel will be pleased to give the necessary details. The ride over the mountain is very invigorating, and the view simply superb."

THE MAINE LAKES.—Farmington, Me., June 2.—I send you copy of Phillips *Phonograph*, with an item of one day's catch of trout in Oquossoc Lake: "Mr. Barry, a guest of Mr. Tuttle, at Lake Point cottage, brought in a beautiful specimen weighing 8 pounds and a fraction; Frank Bacon, a young novice, captured a plump 8-pounder; E. H. Sampson, Esq., of Boston, brought one to his net that scored 7¼ pounds; H. M. Whitney, of Boston, after a desperate struggle landed a 7-pounder, and Col. Rockwell, also from the 'Hub,' killed one of full 5 pounds weight. Besides these monster specimens a large number of lesser weight were brought in and served at the table in Kimball's best style. Within a few days there have been taken from the little steamboat wharf in front of the house one trout of 6 pounds, one of 5 pounds, one of 3½ pounds, and several of minor weight. This is a record of which our visiting sportsmen are justly proud." Oquossoc is the most accessible of the Rangeley Lakes, being only two hours' carriage drive from the end of the Sand River Railroad. A line of steamers connects with the other five lakes that comprise the chain. I think the best fishing is to be found on the second lake, Mooselucmeguntic. A gentleman told me on my down train this morning that he caught, the last day he fished (which was Saturday, May 31), three brook trout that weighed 17 pounds, being of 8, 6 and 3 pounds.—F. N. B.

TROUT AND WATER SNAKES.—Elmira, N. Y., June 7.—I noticed in FOREST AND STREAM of June 5 an account of "A. H. G.'s" experience with water snakes and trout. Five or six years since, on Tim Gray's Run, a tributary of the Lycoming, near Ralston, Pa., I was fishing down stream one afternoon, and had nearly reached the mouth of the stream. I cautiously approached a favorite pool, which was perhaps thirty feet across and four feet deep at the center, and began casting at the outer edge, gradually working toward the middle. I was surprised that I did not have a rise, as I always expected to capture eight or ten fine ones there. I was about leaving when I had a rise from a small trout at the further side of the pool. I cast four or five times at the same place, getting a rise each time, as I supposed, from the same trout, and at last fastened to him. But how hard he pulled for a small trout! As I drew him near I found a water snake over two feet long, fastened at about the middle of a six-inch trout. I drew them across the pool and as much as a yard on the sand before the snake let loose, when it made for the water before I could kill it. The marks of the teeth were plainly seen on the trout. I don't say the trout looked gratefully toward me as I tossed it back into the water, but no doubt it felt so. Now, tell me if you can, why did that trout try so persistently to take my fly?—W. M. S.

EAGLE RIVER.—Milwaukee, Wis., June 3.—Included in a party of three who were in camp at Eagle River, and who in ten hours landed twenty-eight muskallonge, the aggregate weight of which was 415 pounds, was Fred Taylor, the well-known Chicago sportsman. Twelve of the scaly monsters, weighing 195 pounds, were captured by Mr. Taylor, who took them to Chicago and for two days had them on exhibition in front of his place of business, nicely packed in ice. During the time they were so exhibited it required the attendance of two policemen to keep a passageway open on the sidewalk, so great was the crowd attracted by the muskallonge. A placard announced from whence they came, on the Lake Shore road, and it is noticeable that inquiries from Chicago made to the Lake Shore's passenger department, regarding rates, desirable fishing grounds, facilities for supplies, etc., have materially increased in number since Mr. Taylor's free exhibition.

THE AFRICAN POMPANO.—In a late number of FOREST AND STREAM is a note on the so-called "African pompano," of our Florida coast, to which I may be able to add something. This large pompano, which is rather common in Southern Florida and Cuba, is not an overgrown form of the common pompano, but a distinct species; nor, so far as we know, has it anything to do with Africa or with the African *Trachynotus goreënsis*, with which Dr. Günther, and after him several American writers have confounded it. Its right name seems to be *Trachynotus rhodopus*. It is known in Cuba as "palometa," which means dove, and in Florida as "permit," which is a corruption of palometa. There are four species of pompano known on our southern coasts and in the West Indies. (1.) *Trachynotus carolinus*, the true pompano; (2.) *Trachynotus rhodopus*, the big pompano or permit; (3.) *Trachynotus rhomboides*, the round pompano; (4.) *Trachynotus glaucus*, the gafftopsail or banner pompano.—DAVID S. JORDAN.

POUND NETS SEIZED IN THE HUDSON.—On Friday last, Mr. Matthew Kennedy, Game Protector, assisted by Deputy Sheriff Hallenbeck, of Hudson, and a representative of FOREST AND STREAM, took a steamer from Hudson and went down to Rhinebeck. They captured eight pound nets and took them back. The nets were all new and cost from $200 to $400 each. Last year there was one pound net put in the river and its success encouraged others. It is safe to say that the offense will not be repeated, as the men are mourning their loss and the prospect of being fined an amount equal to the cost of their nets. These nets were all between Rhinebeck and Claverack, and the meshes were 2¼ inch, just right to take small fish. We saw white perch in the nets which would not weigh two ounces. The drift net and seine fishermen are rejoicing.

BARNEGAT BAY.—Forked River, N. J., June 9.—Weakfish are now coming into Barnegat Bay, and a number have already been taken with hook and line. Sheepshead are now here and biting well, and in the course of a few days we shall have some fine sport. This place is about three hours from New York via Philadelphia and Reading Railroad. There are one or two good hotels and, unlike most of the places on Barnegat Bay, we are situated directly on the water, thus avoiding long rides to the bay. Parties intending to come here would do well to write a few days in advance either to Capt. Thomas Potter or Capt. Forman Mathews, so as to have bait, etc., ready, as the hotels are quite full and the boats well patronized most of the time.—A.

TROUT IN CONNECTICUT.—An official of the Hartford and Connecticut Western Railroad, writes under date of June 4: I wonder if trout fishing is as good everywhere as it is on our road this season; we are having parties from both ends daily. They go from Hartford and come from Rhinebeck on the Hudson, where we connect with the New York Central railroad, and they all report more trout than there have been before for years, very plenty and good size. Two anglers came in to Hartford the other night after one day's fishing with 200 trout. Another the next night with sixty, and the next night two with each a large string, and they all report the sport so fine it's giving us quite a travel among fishermen.—A. J. J.

NEWS FROM THE BUCKTAIL.—In camp on the Tiadatton (Big Pine Creek). Have had one glorious week anyhow. Shall go on down stream next week. Have a chance to send this out to-day, so I write. Will write up the log and forward it, if my paper has stood the pack-basket. The cruise has been a ratter on the Bucktail. Her keel and garboards look as though she had been used as a stone boat. But, as the river broadens and deepens she jumps fewer stones, and the cruise becomes more tame. So far, about the only use for the double blade has been to keep her off the rocks. I am full fed of fish, well slept on browse, and on the whole, content. It cannot last forever—more's the pity.—NESSMUK.

GUTTA PERCHA CEMENT FOR RODS.—I wish to express my thanks to Mr. Wells for the articles he has written on rod making. I can add that a gutta percha cement which does not have the horrid smell that he speaks of as so unpleasant in that used by shoemakers, etc., can be made by dissolving gutta percha in chloroform, which is a better dissolvant than the bi-sulphide of carbon, the latter being used in the common article because of cheapness. The strongest and best gutta percha is found at rubber stores in thin whitish sheets, looking somewhat like birch bark (thin). It will dissolve in the chloroform (if left a few hours) perfectly. —C. W. E.

ROCK BASS IN THE MOHAWK.—Albany, May 31.—The bass (rock) are being caught now in the Mohawk in great quantities. Two of us on Decoration Day caught about one hundred, some being about nine inches in length and quite fat. We did not see any black bass, nor did we want to.—J. K. T.

WEAKFISH are biting and the Staten Island fishing resorts are crowded with fishers. At Prince's Bay, where is the New York Fishing Club House, August Collins, of New York, this week caught a weakfish weighing seven pounds three ounces, said to be the largest taken there for many years.

ADIRONDACK PINE PLANTING.—William Pickhardt, forester and general superintendent of the Adirondack Club's tract in the southwest part of Essex county, last week sowed seven bushels of white pine seeds upon their lands. The seeds came from Maine, where they were threshed from the cones.

Fisheulture.

DESTRUCTION OF OYSTERS BY NATURAL MEANS.

BY far the greater damage done to oyster beds, in certain regions at least, result from the ravages of two natural enemies, the common starfish (*Asterias vulgaris and A. forbesii*) and the oyster drill (*Urosalpinx cinerea*). The natural history of the former and the mode of operation of both are so peculiar as well as destructive and so little known that a description of each would not be out of place.

Asterias vulgaris is the common starfish north of Cape Cod, while *Asterias forbesii* is common south of that point, but both overlapping and running into each other, while their differences are so slight that it requires an expert eye to distinguish between them. As is common in most starfishes, the number of rays or arms are five, radiating from a central disk. The aspect of the starfish above is such that the common name, starfish, can be easily accounted for. All of the rays as well as the disk, upon its upper surface, are covered with spines placed near together, upon a frame work or skeleton of calcareous matter not visible naturally and exposed only when dried and examined closely, or better by placing in weak caustic potash. A little to one side of the center of the disk and near the angle found by two of the arms, is a small plate called the "madreporic body" on account of its resemblance to madrepore coral, which, if examined with a pocket lens, will show this resemblance very well.

The object and use of this body will be explained presently. The under side of each arm contains several rows of suckers, placed in the middle and extending from the tip to the center of the under side of the disc, to which all the rows converge. Just at the center is a circular opening which serves as a mouth, and is protected by five sets of teeth, each set being composed of six spicules. Just outside of each row of suckers is a row of spines on each side, which can be and are closed over the suckers when they are not in use, meeting in the center so as to form a complete protection. Outside of these are other rows which merge gradually into the spines upon the dorsal surface. At the tip of each arm is an eye which is very primitive, but probably of some use. If one of the suckers be examined it will be found to be composed of a blind tube, opening into the interior of the animal, but presenting the closed end outward. If followed the sucker will be found to pass inside of the animal through an opening in the frame work of the under surface, each sucker passing through a separate opening. All of the suckers in each arm connect with a tube which passes through the arm, all of the five tubes meeting near the gullet and forming a tube which connects with the "madreporic body." Water enters this body, which serves the purpose of a sieve, straining the water, and thus preventing the entrance of foreign particles; then passing through the circular tube into each of the five branches, and from there into the suckers. By contraction of any sucker the water is forced out into a secondary vesicle, there being one to each sucker, and when it is needed that the sucker should be filled again, this vesicle contracts, thus driving the water back again into the sucker. By applying the end of a sucker to a rod or other object and then contracting the muscles and driving the water out, the sucker sucks, acting just like a boy's leather sucker, and it is by this means that the animal moves around from place to place, frequently with a rapidity which would not be expected from such an inanimate looking creature.

Upon all the spines of the starfish are little pincher-like objects called pedicellariæ, which serve the purpose of removing foreign particles which may happen to fall upon the back. By placing the hand near a live starfish in water, the pedicellariæ will grasp the hairs upon the hand and hold on with such power that the starfish can be taken out of water by this means. The apparently independent action of these bodies led to the former belief that they were not a part of the starfish, but parasites upon it. Other species of starfishes may have as many as thirty-six rays. In basket stars (*Astrophyton*), the primary five rays divide and subdivide toward the end, until several thousand are the result.

In regard to its habit of eating, the starfish presents its greatest peculiarity. Its mouth being small, the first supposition would be that it lived upon small animals, which is not the case, but on the contrary, oysters and mussels form its chief food. Approaching an oyster it crawls upon it and bends its arms down over, partly encircling it. The starfish then protrudes its stomach from its mouth, surrounding the oyster with it, and remaining in this position actually digests and absorbs the oyster with its stomach completely outside of the mouth. This operation can be watched at any time by placing a mussel or oyster in a dish of salt water containing a starfish. The manner in which the soft parts of a shellfish are thus digested without injuring or breaking the shell is a mystery, unless we suppose that some fluid is secreted which paralyzes the oyster. Certain we are that it does digest it without leaving any mark upon the shell, and it must have some means of opening the tightly closed shell in order that the digestive fluid may act. A species of deep sea starfish contained a large sea urchin within the mouth, and it seems from this, that certain species do eat in a normal way.

It may not be out of place to mention here the proper way to keep starfishes so that their natural shape shall be preserved, this not being well known to marine collectors generally. By simply allowing them to dry naturally they entirely lose their shape and flatten down to a shapeless mass. Kill them in fresh water and then dry in an oven, or, still better, kill in alcohol and dry in the sun or in an oven, and the natural shape will be well preserved. Upon the southern coast of New England starfishes advance in immense "schools," devastating large fields in a short time. As these animals form valuable manure, it would be worth the trouble of the oystermen to obtain them for this purpose. It was formerly the stupid habit of the oystermen to cut the starfish into two, three or four pieces, not knowing that each piece would in time reproduce itself, and form two, three or four perfect animals instead of the one started with and supposed to be destroyed.

The other pest, *Urosalpinx*, is a univalve shell, not differing in any marked respect from the ordinary marine gasteropods. It is very small and inoffensive-looking, but is capable of most disastrous work. All gasteropods possess what is called an "odontophore," or tongue. This consists of an elastic strap, upon which are arranged transverse rows of teeth. Each end of the strap is worked by muscles, which, alternately contracting, cause the toothed strap to work backward and forward over the end of a pulley. The strap consequently acts after the fashion of a chain saw upon any substance to which it is applied, and the resulting wear and tear of its anterior teeth are made good by the incessant development of new teeth in the secreting sac, in which the hinder end of the strap is lodged. As the anterior teeth are worn down they are absorbed, and others formed in the sac take their place. The "oyster drill" approaches the oyster, and, placing the end of its pulley upon the shell, begins working his apparatus, and continues until a perfectly round hole is the result, for the soft carbonate of lime resists but poorly the continuous action of these siliceous teeth. The hole is always round and prettily made. Holes made by other similar species may frequently be seen in dead valves of shells washed ashore on beaches. Once getting the hole made, the rest is easy, for by applying its strap in a similar manner to the flesh, the oyster may be literally rasped up and eaten. Of course a whole oyster cannot be eaten by one little oyster drill, but it is probable that after eating his fill he moves off and attacks another. The oyster partly killed probably allows its shell to open, and then it is devoured by crabs (*Panopeus*) and the like. The "drill" is the oyster's worst enemy, for it will flourish in brackish water, while starfish need salt. Oyster beds upon the southern coast of New England suffer much more from starfish than do those in the Chesapeake, for this very reason.

RALPH S. TARR.

DISTRIBUTION OF CATFISH.—The Potomac River catfish has at last found a place in the heart of the U. S. Fish Commissioner, and 300 of these fish are now en route to Wisconsin in the care of one of the Commission. They will be distributed among the lakes and rivers of the Badger State and allowed to grow up with the country. For many years catfish were considered poor food by Washingtonians unless it was the negroes, and they preferred any other variety, but of late they have come into the market and are extensively used for making chowder. Some residents of the capital declare they are better food fishes than the German carp, which is being so extensively propagated by the Government. The same car that carried catfish to Wisconsin also carried the last shipment of Potomac shad for this season. The shipment consisted of 950,000 young fish. They will be distributed in the waters of Colorado. The station on Sixth street and the cars will soon be arranged for the fall distribution of young German carp.—HOMO.

MOSS FOR CRAYFISH.—The Vicksburg (Miss.) *Herald* says that Capt. M. Hughes has discovered that the use of a layer of Spanish moss in a dike or dam prevents the damaging work of crayfish in boring holes through them.

There is a controversy as to whether an eagle will sit on a limb and let himself become encased in ice. Edward P. Roe related an instance of that kind, and his accuracy was questioned. John Holder now tells how, at Bloomington, Ill., he had an eagle brought to him covered by ice so completely that it could not move legs or wings, fell from the tree on which it had perched, and was captured by a boy.

FIXTURES.

BENCH SHOWS.

June 10, 11, 12 and 13.—The Second Annual International Bench Show Chicago, Ill. Mr. Charles Lincoln, Superintendent.

Sept. —.Bench Show of the Philadelphia Kennel Club. Mr. P. C. De Saque, Secretary.

Oct. 8, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 14.—Non-sporting Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Charles Lincoln, Superintendent.

AMERICAN KENNEL REGISTER.

OUR little monthly contemporary, the *American Kennel Register*, continues to meet with great favor on all hands. The best evidence that it was needed is seen in the anxiety of breeders and owners to register their stock. The June number runs up the entries to between 1300 and 1400, and the pressure for entries is so great that this month's *Register* is again enlarged to twenty pages. The *Register* started fifteen months ago, as a twelve page paper, but for several months now it has been regularly printing sixteen and twenty pages, which is certainly a good deal for the merely nominal subscription price—one dollar. It is a complete record of all events interesting to dog-owners and breeders.

THE CHICAGO DOG SHOW.

[Special to Forest and Stream.]

CHICAGO, June 10, 1884.

THE opening day of the second grand international bench show at D Battery Armory was all that could be desired in point of exhibits and attendance. The Hon. Carter H. Harrison, Mayor of the city, formally opened the show at 8:30 in the evening with a happy speech. The judges are Messrs. Mortimer and Taylor, and awards were made Tuesday in the English, Irish and Gordon setter classes. The champion English setter prize went to W. B. Gates's Paul Gladstone; extra champion prize English setter bitches, W. B. Shattuck's Dido II.

POINTERS AT NEW YORK.

Editor Forest and Stream:

I visited the last New York dog show with the avowed intention of examining critically and thoroughly both the large and small size champion pointers, having in view chiefly Beaufort, Meteor and Bang Bang. The attendants of the two first named dogs allowed me to see them out of their stalls, and after a most thorough examination I could arrive at but one opinion, viz., that Beaufort is by far the grandest pointer I have ever seen, barring none. I did not arrive at this conviction hastily, but studied them well from head to foot. My conviction was strengthened by corroboration on the part of several of the oldest and best pointer men, who not only have bred pointers, but won with them after they had bred them against all comers. Imagine, therefore, my surprise after the show to read Mr. Cornell's remarks, wherein he states that Beaufort's "legs are extremely bad, being crooked fore and aft." I was dumbfounded at such words, and still believe my original criticism of the dog was correct. I again examined him more critically than before, only to be convinced he has the most magnificent set of legs and feet that ever a pointer stood upon, and not only that, but his hindlegs are most beautifully crooked as they should be. Mr. Cornell is evidently much at fault here, and when speaking of Beaufort's legs must have had Bang Bang's in his mind, which are wofully straight at the stifles, a most glaring fault. It seems strange that Mr. Mason, with his extended knowledge of pointers, would pay $1,000 in good money for a dog with bad legs fore and aft.

The articles in your paper after the Washington show of 1883, both by your editor and Mr. Mason before he owned Beaufort, spoke only a part of his beauty. Mr. Cornell further adds that Bang Bang is the most strikingly handsome pointer dog in America. How Mr. Cornell, the Secretary of the Westminster Kennel Club, can make such a statement, I am at a loss to understand. He must either be sadly deficient in knowledge of the points of the dog, or is carried away with the fancied superiority of his dog as viewed by his partial eyes. The first thing that struck me as I was examining him in his stall was his "black eyes and black nose." Is this a charming attribute of a lemon and white pointer? Stonehenge says it is not admissible. Vero Shaw, in his article on pointers says, that in a lemon and white pointer this blemish is "sufficient for disqualification." How in the face of such authority as Stonehenge and Vero Shaw can Mr. Cornell still claim that "Bang Bang is the most strikingly handsome dog in America." Perhaps the first-named gentlemen are incompetent to state the points of a lemon and white pointer. Will he throw lemon and white pups? Will some black and white ones creep in mysteriously? In that unfortunate event, they should be drowned.

Heretofore Sensation has been held up as the typical pointer. If such is the case, what shall we do with Meteor? for they are opposite types. If Meteor is a good dog, how about Sensation? The first is long on the legs and short in the back, the latter short in the legs and long in the back. Which is the typical dog? Which shall I breed from? Both cannot be correct types. Who is at fault? The result is that the Westminster Kennel Club, instead of enlightening us as to correct type, has so confounded us that we are all at sea. Were I dependent upon the foregoing I should be equally at a loss how to act; but, relying upon my own judgment, I shall breed to Beaufort, as he comprehends my highest ideas of what a large pointer should be. As a stock getter Beaufort has no superior in this country, and is getting very fine stock. Bang Bang, on the other hand, I understand, gets black and white puppies from every bitch put to him. If so, why is this? It was reported at our last show that the Westminster Kennel Club offered $500 for Beaufort at the Washington show. Would they buy a dog with such glaring faults as they attribute to Beaufort? If the offer had been accepted they would have had at least one pointer to which they could have bred their bitches without being obliged to go outside their own kennel.

Mr. Cornell claims Beaufort is throaty. All large dogs are throaty, but there is no excuse for a small dog like Bang Bang being so. Let us try to improve rather than lead breeders astray by statements which are not verified, when lemon and white pointer bitches bred to lemon and white stud dogs throw black and white pups. A BREEDER OF SPORTING DOGS.

Editor Forest and Stream:

Mr. Cornell displays such lack of knowledge in treating his subject that it would seem as if his real motive were only to belittle Knickerbocker and Beaufort, and to try to support Mr. E. C. Sterling's most erroneous judging. To say the least, his letter displays very bad taste and is altogether uncalled for. His statement that Knickerbocker is "cowhocked," needs no further comment than that it would be well for Mr. Cornell to post himself on subjects of which he is ignorant, before passing public opinion.

Mr. Cornell says "Meteor was the best of the lot." Can he conscientiously say so, when Sensation was considered by him a typical pointer? Verily, I think them the extremes of one another. He further states, "His (Meteor's) one important fault is that his head is not handsome. There is almost no stop below the eyes and little depth of skull." So in head he has an important fault; is dish-faced and has no brain. His snipy muzzle, and at times badly carried ears, he forgets to mention. And a dog with a head that has not a redeeming

feature about it, not considering his other faults, he wants to see noticed at bench shows and thinks worthy of the title "champion."

That Knickerbocker is somewhat faulty in parts mentioned by Mr. Mason in his able article, "Pointers at the Late N. Y. Show," I freely admit, and that he is a better pointer than the "plain dog" is saying but little to his credit. Mr. Cornell has either forgotten a great deal about pointers or else needs a little more experience. He finds faults in others' dogs where none exists, but is oblivious to those that exist in his own. Does he consider Bang Bang's short and throaty neck perfect? He, a small and young dog! Does he consider him perfect in stifles? I must admit his tail looked nice at the late show, but when I saw him before, the abundance of coarse hair and carriage of that appendage was most marked. Besides, does he think black nose and eyes the correct color for a lemon and white dog?

On the whole, Mr. Cornell, we are well satisfied with our dog. Will admit of the faults that exist but will always defend him from abuse, and in conclusion will state that he is getting good liver and white and lemon and white stock, and we are not troubled with a superabundance of black and white pups.

GEO. L. WILMS.

Editor Forest and Stream:

Since you have opened your columns to Mr. Mason to criticise, and in my opinion, to misrepresent the pointers at the recent New York show, I feel safe in sending you the following, and while it refers only to the dogs in my kennel, I think you will accord me the same right to speak in their favor that you did Mr. Mason to speak against them. My kennel is a public one. I advertise my dogs in the stud and my pups for sale when I have them. I therefore don't question any man's right to criticise them, but I do question his right to misrepresent them, when his purpose is so palpably to detract from their market value and to bolster up the market value of his own. I take a great pride in my dogs, but I don't pretend to ignore their value to me in dollars and cents. I would continue my breeding kennel just as it is, whether or not I ever sold a pup or the service of a dog. My income is from another business, no more legitimate nor agreeable than dog breeding, but more profitable. To the pride which a breeder should feel in winning prizes with his animals in my case is the desire to add to their reputation and thus to the market value. I hope my position, therefore, will not be misunderstood. When the day arrives, which I believe it will, that I can win prizes with dogs of my own breeding, as I do now with dogs which my judgment prompted me to select and bring together to form my kennel, I will be still prouder than I now am, and I will consider them still more valuable than I now do.

To criticise Meteor unfavorably at any other point than his head is, in my opinion, either ignorance or malice. If he were a trifle deeper through the nose and a trifle higher in the skull it would add to his beauty, not a whit to his worth. His head is not defective anywhere; it simply might be improved. Not a sixteenth of an inch could be added to or taken from the length or width of it without injury. If his ears hung a trifle closer to his head I would like them better. His eyes are faultless. His neck is not equalled by any large pointer living. It is as clean and fine as a sword. From the back of his ears to the tip of his tail the dog is simply faultless, and none know it better than his defamers. When he was shown in the ring at New York in the champion class, in competition with Beaufort, there was not a well-informed pointer man among the spectators who did not see at a glance how far superior he was. Beaufort's handler pressed the dog's baggy throat up with his hand as well as he could and pushed his head up as much as possible to make him stand light on his fore feet and not expose his Durham bull chest and shoulders, and with his other hand he held the dog's tail out by the tip of it to make what otherwise naturally hung limp with a downward hook at the end look straight. Meteor was cut loose by his handler to move around and show himself naturally, and when the judge ordered Beaufort turned loose and he moved off like a cow it was his Waterloo. Meteor suffered during the four days of the show from an abscess on his cheek, which probably a thousand persons every day handled and pinched and squeezed, simply because they saw the lump so prominent, and which burst on the third night of the show. It is not to be supposed he felt in very good show fix, but when he went into the ring he was in comparison with Beaufort as a thoroughbred to a plough horse. I say very freely that I don't feel at all proud of his beating such a dog as Beaufort, for that dog's reputation rests upon not a thing but his owner's advertisement that he is the handsomest dog in America. The honor of his winnings at Washington and New Haven only needs to be scrutinized to be appreciated. Meteor's first appearance was at Cincinnati in March last, where in a class of fourteen he won first, under Major Taylor's judging. He was next shown at Toronto, in the same month, and won first under Mr. John Davidson's judging, and I am informed Mr. Davidson pronounced him the handsomest pointer he ever saw. He was next shown in St. Louis, where he won the championship without competition, the owner of Faust deciding not to show his dog against him, and he also won every special for best pointer, under Major Taylor's judging. At New York he won the championship; the sweepstakes and all specials, under Mr. E. C. Sterlings judging. The soreheads, whose dogs could not win, may cast all the reflections they please upon Mr. Sterling's interest in the dogs I exhibited at New York. I care nothing for their insinuations. Their reflections don't change the fact that Mr. Sterling is one of the best judges of a pointer in America, liable as all men are to be wrong sometimes. I did not agree with him in all his decisions at New York, but this is only my opinion against his. I certainly thought Maxim entitled to second or third in his class, where he only got vhc.

I can't see why there should be such a contemptible jealousy of my winnings. If my competitors will only spend their money and get dogs that are worth something, they can win prizes too; but just so long as they stick to the mongrels that are exhibited and advertised as pointers, just so long will they be failures. I am willing to go on record as saying that Meteor and Bang Bang are (barring the head of each, which, I think, could be slightly improved) the best pointer dogs in America, and the only type of the pointer to breed to. Had Bang Bang been shown in Cleveland in his New York form he would have won first, but I believe he was justly beaten there. To-day I don't think he can be beaten by any pointer of his weight in America; and I don't think a pointer will ever be bred in America, except by chance, from the Glenmark and Girl, and Icicle and Lily and similar mongrel breed, that will approach the true pointer type of Meteor and Bang Bang.

JOHN W. MUNSON.

ST. LOUIS, Mo.

Editor Forest and Stream:

As a breeder of pointers, I cannot sit still and see a grand dog like Beaufort criticised as has been done in these columns by Mr. Cornell. I paid a visit to Mr. Mason last week expressly to examine Beaufort, and I must say in justice to the dog and fairness to his owner, that I have never seen his equal. I failed to find more than one fault in him, a fault to be found in every large dog I have seen. He is a little throaty. His head, body and tail are perfect, and he stands on the best legs and feet I have ever seen on a big dog. I have seen some of Beaufort's get, including Fritz, winner in the large-size class at the last New York show, and I am satisfied that Beaufort is not only the best looking pointer we have, but what is of more importance, he is the best stock dog. It is worse than idle to compare Bang Bang with this dog, it is silly. Mr. Mason's criticism of Meteor was correct, he is not a show dog; his remarks about Bravo being a better dog than Bang Bang I also indorse. As a stud dog Bang Bang is a failure, I know that he gets black and white puppies from almost every bitch put to him; let Mr. Cornell deny this. If Bang Bang is a good dog why don't he win prizes under some other judges than those appointed by the Westminster Kennel Club? If he has a show with Beaufort, why did Mr. Cornell not accept Mr. Mason's challenge? Was it because Mr. Mason insisted on having a competent and impartial judge? I will now give Mr. Cornell a chance: The most successful American exhibitor and breeder of pointers is Mr. Orgill, and he is known to be a man that influence cannot reach. I will match Beaufort against Bang Bang for any sum he names, or a cup of any value, and will agree that Mr. Orgill shall decide which of the two is the better dog. Something must be done for bench shows. It is time that dogs, not owners, were judged; until this is done we must look for nothing but dissatisfaction, and improvement cannot take place.

J. H. PHELAN.

75 CLIFTON PLACE, Jersey City.

Editor Forest and Stream:

In justice to my old favorite, I will state that all who have ever seen Beaufort (with but few exceptions) unhesitatingly pronounced him the best large pointer they have ever seen. He has grand legs and feet and I have hunted him for days over the roughest of our country, and I have never yet seen him legtired or footsore, and he does not lack points necessary to make him a good field dog, for no dog possesses more natural field qualities and endurance than Beaufort. And Mr. Cornell is mistaken about his being "stilty," for he is not "stilty," no matter how you may look at him, and no pointer in America is getting finer stock than Beaufort, and I believe that he will find and point as many birds as any dog living.

G. H. NIXON.

LEESBURG, Va., May 31, 1884.

Editor Forest and Stream:

As I do not wish to be held accountable for anything I have not said I beg of you to correct a sentence in my letter to you, written last week. The printer makes me say in a sentence referring to Beaufort, "His hocks are likewise also bent." What I did say and what I say now is, "His hocks are also bent." "Likewise also" is a little too much to say.

ROBT. C. CORNELL.

NEW YORK, June 6.

Editor Forest and Stream:

I had a pointer bitch in the last bench show of the Westminster Kennel Club, which (deservedly as I think) did not take a prize.

Imagine my surprise a few days after the close of the show receiving the following letter signed by the name of a gentleman with whom I have no acquaintance, whose name has become familiar to me through various controversies carried on the past year or two in the public newspapers over the comparative merits of certain dogs owned by him and those owned by the Westminster Kennel Club and others, and over questions of the proper and correct manner of judging certain breeds of dogs, a gentleman whom I have never seen but once, and that when he was pointed out to me at a dog show.

The letter received by me is as follows:

DEAR SIR—A protest, indorsed by fifty exhibitors and breeders of pointers, is to be published against the absurd decisions at the late N. Y. show. The protest is already signed by many of the most influential exhibitors, breeders and clubs. May I add yours?

If you have any friends interested in the welfare of the breed I shall esteem it a favor if you will ask them to add theirs also.

An early reply will greatly oblige. Faithfully yours

CHAS. H. MASON.

No. 49 W. 24th St., New York City, May 21, 1884.

I did not answer the letter, but I was rather indignant at it. If it had been signed by an unknown name or by one not so publicly identified with exhibiting, breeding and judging as Mr. Mason, I should have regarded it as the effusion of a young and disappointed exhibitor, who, having for the first time a dog in a bench show, had become incensed at not receiving a prize. But coming from Mr. Mason, I was at a loss how to regard it.

In your issue of May 29 I notice that a letter, almost similar to the one sent me, was received by the manager of the kennels of J. O. Donner, Esq., who, as I have been informed, was, like me, an unsuccessful aspirant for honors at the last show.

My curiosity has become intensely aroused on this matter, and I shall not be contented until the following two problems have been solved:

First—Has Mr. Mason written to other disappointed exhibitors any more letters similar to those above mentioned, and if so, how many such letters has he sent out?

Second—What were his motives in writing and sending such letters?

The solution of these two questions is of interest, not only as a matter of individual curiosity, but also that due weight may be given to the protest when it shall appear; and, further, perhaps it may prove of value in throwing some light on the character and temper of Mr. Mason and on the manner in which he conducts, has conducted and may conduct controversies, present, past and to come, as well as on the methods adopted by him to affect public judgment.

If through you and your readers I can obtain any answers to these questions, I shall feel very grateful.

C. D. INGERSOLL.

UNIVERSITY CLUB, New York, June 7.

THE NON-SPORTING DOG SHOW.

Editor Forest and Stream:

The managers appointed by the Westminster Kennel Club to conduct the show of non-sporting dogs, greyhounds, deerhounds and fox-terriers, which will be held in October next at Madison Square Garden, New York, cordially invite all those interested in the improvement and development of these dogs to send them such suggestions as to premium list, change of bench show rules, etc., as may occur to them.

Communications may be addressed to me at Box 1,812, New York post-office, and will be carefully considered by the managers.

CHAS. LINCOLN, Supt.

THE BENCH SHOW MEETING.

Editor Forest and Stream:

We have only to-day discovered that the circular invitation to American kennel clubs asking a conference at Delmonico's on June 21, named no hour. Kindly state that the time will be 8:30 P. M.

ROBERT C. CORNELL, Sec'y W. K. C.

THE PROPER SIZE FOR BEAGLES.

Editor Forest and Stream:

Your correspondent, "Flat," in your last issue, advocates a large-sized beagle as the best suited for foot packs, while that genial writer, "Lillibullero," in a preceding number of FOREST AND STREAM, condemns fourteen-inch dogs as being too fast for the work, and cites an instance in his own experience to sustain his position. Both gentlemen being Englishmen and, therefore, presumably conversant with the topic, we are glad to have their views. But as they are arguing from a British standpoint it will be well to see how their opinions will apply on this side of the water.

Here hunting with foot packs, except in some chance locality, is entirely out of the question. The habits of our little American hare (*Lepus sylvaticus*), the game on which beagles are principally hunted, preclude the possibility of any party of hunters following the pack or seeing the beauties of the run. Our hare when started from his form, generally in some briery thicket, flies to the densest cover, the more difficult the ground the better it suits his dodging and doubling. Therefore, the only way we can use the beagle is with the gun, the shooter being stationed on a runway and killing the hare ahead of the hounds when opportunity offers.

For this purpose, I incline to think, the smaller-sized dog, say from eleven to twelve inches, is best suited, for the reason that he drives his game slower and gives more chances for shots. Larger beagles go too fast, and the hare, in danger of being run into and killed, turns down the first convenient woodchuck hole or takes refuge under a rock, and thus ends the chase.

I hope this question of the proper working size of beagles will be discussed at length in the FOREST AND STREAM, and that we will hear further on a subject so pleasantly opened by "Flat" and "Lillibullero."

RUSTICUS.

PHILADELPHIA KENNEL CLUB.—It is the wish of the Philadelphia Kennel Club that the readers of the FOREST AND STREAM should know that they are not connected with the Philadelphia Kennels. The former is an association of canine lovers, who have clubbed together for the purpose of holding yearly dog shows and field trials. Their rooms are situated on the corner of Thirteenth and Market streets, to which all communications should be addressed. The Philadelphia Kennels are owned by a firm known as the Bird Food Company, which does business on Eighth street near Locust, and deals generally in canary birds, chickens, ferrets, etc. This statement is made for the reason that the Philadelphia Kennel Club is daily receiving letters in answer to an advertisement in FOREST AND STREAM of the Bird Food Company, or Philadelphia Kennels.—HOMO.

THE BENEFIT OF THE DOUBT.—In September, 1879, I chanced to fall in with poor Dave Sanborn, who was then giving Count Noble his first field lessons in Martin county, Minn. I got quite interested in his method of training, and for several days shot to his handling. On one occasion a covey rose wild from a piece of tall corn, and on entering it we found Count and his companion lying close, both having doubtless dropped to wing. Dave instantly drew his whip and commenced lashing poor Count, although from their relative positions it was evident that the flush had been made by the older dog. Of course, I was indignant at such gross injustice, but to my warm expostulation Dave quietly replied: "It may be so; there's no telling; but in such cases I always give a puppy the benefit of the doubt."—WAUZEE (Glen Allen, Va.).

PROPOSED ENGLISH BEAGLE CLUB.—A correspondent writes to the London *Field:* "I think there would be little difficulty in getting enough members to form an English Beagle Club. As regards forming a proper standard for judging, I consider we cannot do better than judge our pets by the standard laid down by the American English Beagle Club, which I think is as near the mark of what a true beagle should be as possible. I inclose a copy of the same, and shall be pleased to send a copy to any brother fancier who would like one. I shall be pleased to hear from any brother fanciers on the club subject; and could not a meeting be arranged during the Palace dog show in July?"

CLOVER BELLE.—At the late show of the Westminster Kennel Club, the Messrs. Rutherfurd, at the request of the Clovernook Kennel, had their kennelman examine the fox-terrier puppy Clover Belle, to ascertain, if possible, her correct pedigree. He pronounced her to be indisputably by Joker out of Warren Wakeful, not by Joker out of Warren Bessie, as catalogued. The mistake came about through the fact that she, in company with some twenty other puppies, were sold by the Messrs. Rutherfurd at auction, and it was impossible subsequently to identify her without their kennelman's assistance.—CLOVERNOOK KENNEL.

NEW ENGLAND KENNEL CLUB.—This new organization, formed in Boston, has secured very fine rooms at 159 Tremont street, in the new Emerson piano building, and an opening will be given in June. The apartments are very pleasant and overlook the Common, taking in a full length of the green. A bench show, under the auspices of the club, will very probably be given some time in February next, the next sixty days deciding the matter.—HOMO.

BEAGLE IMPORTATION.—Philadelphia, June 7.—*Editor Forest and Stream:* I have entered my beagles, two dogs and a bitch, at the Crystal Palace Bench Show, July 1 to 4, 1884. Purchased from Edwin S. Carew Gibson, of Sussex, England. They will be imported at an early date, when you will receive a full description of them. They are of the celebrated Crane stock.—W. H. ASHBURNER.

SPANIEL IMPORTATION.—*Editor Forest and Stream:* I notice in your last issue that you give Mr. Laidlaw credit of importing the cocker spaniel bitch Newton Abbot Lady from Mr. Jacobs. I wish you would say in your next issue that I imported her and sold her to Mr. Laidlaw after she landed in New York.—G. W. LEAVITT (Boston, Mass., May 26).

AN IRISH LAVERACK.—The following advertisement appeared in a late Baltimore paper: "For sale. An Irish setter one year old, guaranteed of Laverack stock—father cost $500. Sold because owner is going to Europe."

HE HAS A DOG.—Capt. Robert W. Andrews, age 93, is now afoot from Sumter county, South Carolina, to Maine. He is accompanied by a dog which is not more than half as old as he is.

KENNEL NOTES.

NOTICE TO CORRESPONDENTS.

Kennel notes are inserted in this column free of charge. To insure publication of notes, correspondents MUST GIVE the following particulars of *each animal;*

1. Color.
2. Breed.
3. Sex.
4. Age, or
5. Date of birth, of breeding or of death.
6. Name and residence of owner, buyer or seller.
7. Sire, with his sire and dam.
8. Owner of sire.
9. Dam, with her sire and dam.
10. Owner of dam.

All names must be *plainly* written. Communication on one side of paper only, and signed with writer's name.

NAMES CLAIMED.

☞ *See instructions at head of this column.*

Stella. By Miss Stella B. Jones, Chicago, Ill., for red Irish setter bitch, whelped Jan. 21, 1884 (Glencho—Bess).

Nelle. By Mr. Eberhard Vollmer, Trenton, N. J., for red Irish setter bitch, whelped Jan. 21, 1884 (Glencho—Bess).

Juliet. By Mr. Wm. R. Caminoni, Brooklyn, N. Y., for red Irish setter bitch, whelped Jan. 21, 1884 (Glencho—Bess).

Lou. By Mr. Jerome B. Wheeler, New York, for red Irish setter bitch, whelped Jan. 21, 1884 (Glencho—Bess).

Martha. By Mr. Walter B. Peet, New York, for red Irish setter bitch, whelped Jan. 21, 1884 (Glencho—Bess).

Norah. By Mr. Theodore Feroe, Madalin, N. Y., for red Irish setter bitch, whelped Jan. 21, 1884 (Glencho—Bess).

Fannie Obo. By Mr. H. C. Bronsdon, for black cocker spaniel bitch, whelped April 29, 1884 (Smut—Obo II.).

Belfast, Gorham, Goodwin, Seth, Tom, Lizzie and Maud. By Major Lovejoy, Bethel, Me., for red Irish setters, whelped May 16, 1884 (C. F. Crawford's Arlington—Maggie O'More, A.K.R. 981).

NAMES CHANGED.

☞ *See instructions at head of this column.*

Guard to Marmion. Mastiff dog, whelped March 4, 1884 (champion Brenda, A.K.R. 1143), owned by the Stawberry Hill Kennel, Leicester, Mass.

BRED.

☞ *See instructions at head of this column.*

Nellie—Frank. Dr. J. S. Niven's (London, Ont.) cocker spaniel bitch Nellie to his Frank.

Black Bess—Frank. Dr. J. S. Niven's (London, Ont.) cocker spaniel bitch Black Bess to his Frank.

Flora—Frank. Mr. Dan O'Shea's cocker spaniel bitch Flora to Dr. J. S. Niven's Frank.

Norah—Garryowen. Dr. J. S. Niven's (London, Ont.) Irish terrier Norah to his Garryowen.

Lady Vinem—Max Adler. Dr. G. I. Royce's white and mouse English greyhound bitch Lady Vinem (Count Custer—Lady Rose) to Max Adler, May 4.

Lady Dufferin—Croxteth. Mr. J. C. Heckscher's pointer bitch Lady Dufferin to Mr. A. E. Goddeffroy's Croxteth, May 12.

Fan Fan—Croxteth. Mr. J. O. Donner's pointer bitch Fan Fan to Mr. A. E. Goddeffroy's Croxteth, May 20.

Vinne—Croxteth. Mr. A. E. Goddeffroy's pointer bitch Vinne to his Croxteth, June 5.

Dot II.—Scamp. Mr. John A. Graham's black, white and tan setter bitch Dot II. (Rex—Dot) to Scamp (Fred—Flora), April 26.

Lady N.—Joe Hinds. Mr. John A. Graham's liver and white pointer bitch Lady N. (Marshall—Taluiah) to Joe Hinds (Hindoo—Flight), May 18.

Flora II.—Black Prince. Mr. Charles Wray's (Monsey, N. Y.) cocker spaniel bitch Flora II. (Cumming's Flora—Cumming's Snipe) to Mr. A. C. Wilmerdine's Black Prince (A.K.R. 62), May 31.

Rose—Jack. Mr. H. E. Elston's dark red Irish setter bitch Rose (Darkness—Ruth) to Mr. Geo. W. Whelen's Jack (Elcho—Nettie), June 1.

Beauty—Napoleon. Mr. W. D. Peck's (New Haven, Ct.) pug bitch Beauty to his Napoleon, June 6.

Cricket—Bannerman. Mr. Arthur M. Wood's (West Philadelphia, Pa.) English beagle bitch Cricket (Bugler—Pitts) to Mr. Louis D. Sloan's imported Bannerman, May 26.

Kitty Wells—Fritz. Mr. J. H. Thompson, Jr.'s (Patterson, N. Y.) pointer bitch Kitty Wells (A.K.R. 1043) to his Fritz (A.K.R. 268), June 4.

Grand Duke—Rosy. Hon. Edmund Sandy's bull-terrier bitch Rosy to Messrs. R. & W. Livingston's champion Grand Duke (Hink's Dutch—Young Magnet), May 11.

Ruby O'More—Nimrod. The Ashmont Kennel's red Irish setter bitch Ruby O'More (A.K.R. 689) to their champion Nimrod (A.K.R. 631), May 28.

Madge—Hero II. The Ashmont Kennel's gray mastiff bitch Madge (A.K.R. 548) to their Hero II. (A.K.R. 545), May 30.

Lizzie—Hiram. Mr. Jas. Lindsay's (Jersey City, N. J.) collie bitch Lizzie (Rex—Topsey) to his Hiram (A.K.R. 882), May 10.

Fairy—Brack. Mr. Jas. Lindsay's (Jersey City, N. J.) collie bitch Fairy (Rex—Kitty Mac) to Brack (A.K.R. 3), May 13.

Nannie O.—Darnley. Mr. Jas. Lindsay (Jersey City, N. J.) collie bitch Nannie O. (Rex—Kitty Mac) to Mr. I. Van Schaack's imported Darnley, May 26.

Chiquita—Oberon. Mr. E. S. Hawks's (Ashfield, Mass.) English setter bitch Chiquita (Druid—Pocahontas) to Mr. P. H. Foster's Oberon (Count Noble—Rosalind), May 8.

Music III.—Ringwood. Mr. E. S. Hawks's (Ashfield, Mass.) beagle bitch Music III. (Flute—Victress) to Mr. N. Elmore's imported Ringwood, May 13.

WHELPS.

☞ *See instructions at head of this column.*

Cricket. Mr. John Drus's (Little Rock, Ark.) Irish water spaniel bitch Cricket, May 10, eleven (six dogs), by cocker spaniel Lou; all solid liver.

Myrtle. Mr. Louis D. Sloan's (West Philadelphia, Pa.) imported beagle bitch Myrtle, June 1, five (three dogs), by Mr. Crane's (Southover House, Eng.) champion beagle Marchboy.

Little Maggie. Messrs. R. & W. Livinston's (New York) bull-terrier bitch Little Maggie (Hink's Dutch—Young Venom), May 29, six (five dogs), by their champion Grand Duke (Hink's Dutch—Young Magnet); three since dead.

Fleda. Mr. Jess. M. Whaite's (Chester, S. C.) pointer bitch Fleda (champion Bow—Flight), June 3, ten (six dogs), by Young Sleaford (Lort—Lass).

Graceful. Mr. Luke White's Graceful, May 22, four (two dogs), by champion Bang Bang; three lemon and white and one liver and white.

Grace. Mr. Luke White's champion Grace, June 1, seven (three dogs), by Mr. C. H. Mason's Beaufort; four liver and white and three lemon and white.

Maggie O'More. Major Lovejoy's (Bethel, Me.) red Irish setter bitch Maggie O'More (A.K.R. 981), May 16, seven (five dogs), by Mr. C. F. Crawford's Arlington.

Jeannie Nettles. Mr. Jas. Lindsay's (Jersey City, N. J.) imported collie bitch Jeannie Nettles (Old Sweep—Lassie), May 2, seven (five dogs), by champion Rex (A.K.R. 149).

Beauty, Mr. Jas. Lindsay's (Jersey City, N. J.) collie bitch Beauty (Ayrshire Laddie—Moosey), May 7, five (four dogs), by Rex (A.K.R. 149).

Nellie. Mr. Jas. Lindsay's (Jersey City, N. J.) collie bitch Nellie (Rex—Flora), April 30, nine (six dogs), by Ayrshire Laddie (A.K.R. 145).

Countess C. Mr. J. Yearsley, Jr.'s (Coatesville, Pa.) English setter bitch Countess C. (Dashing Tim—Armida), May 2, nine (four dogs), by Mr. J. M. Avent's Rush Gladstone.

SALES.

☞ *See instructions at head of this column.*

Leader. Beagle hound (A.K.R. 319), by Messrs. R. & W. Livingston, New York, to Mr. A. Winsor, Providence, R. I.

Nimbow. Red Irish setter dog, whelped April 9, 1884 (Nimrod, A.K.R. 631—Cleo), by the Ashmont Kennel, Boston, Mass., to Mr. F. M. Harris, Worcester, Mass.

Nimrod II. Red Irish setter dog, whelped April 9, 1884 (Nimrod, A.K.R. 631—Cleo), by the Ashmont Kennel, Boston, Mass., to Mr. A. L. Fooote, North Parma, N. Y.

Castelar. Fawn mastiff dog, whelped Jan. 26, 1884 (Diavolo, A.K.R. 543—Madge, A.K.R. 548), by the Ashmont Kennel, Boston, Mass., to the Philadelphia Kennel, Philadelphia, Pa.

Benedict's Boy. Solid black field spaniel (A.K.R. 130), by Mr. Herman F. Schellhass, Brooklyn, N. Y., to Dr. H. C. Eno, New York City.

Benedict's Boy—Lady Bub whelp. Black cocker spaniel bitch, by Mr. Herman F. Schellhass, Brooklyn, N. Y., to Mr. Geo. W. Whitcomb, Boston, Mass.

Glencho—Bess whelps. Red Irish setter bitches, whelped Jan. 21, 1884, by Mr. Fred. Waterman, Hudson, N. Y., one each to Mr. Walter B. Peet, Mr. Jerome B. Wheeler, Mr. Lawrence M. Kostwright and Mr. W. B. Wetmore, New York; Mr. F. Carroll Hankes and Mr. Henry M. Haner, Hudson, N. Y.; Mr. Theodore Feroe, Madalin, N. Y.; Mr. Wm. R. Caminoni, Brooklyn, N. Y., Mr. Eberhard Vollmer, Trenton, N. J., and one to Miss Stella B. Jones, Chicago, Ill.

Glencho—Daisy whelps. Red Irish setters, whelped April 2, 1884, by Mr. G. Hills, Hudson, N. Y., to Mr. F. I. Church, Concord, N. H.; Mr. F. C. Herrick, Albany, N. Y.; Miss J. Scott, Scottville, N. Y.; Mr. Chas. Epelstyn, Hudson, N. Y.; Mr. Harry W. Livingston, Livingston, N. Y.; Mr. H. Spencer, Catskill, N. Y.; Mr. J. M. Leekley, Galena, Ill., Mr. H. E. Chubb, Cleveland, O.

Guard. Yellow fawn, black muzzle, mastiff dog (A.K.R. 1143), by Mr. J. A. S. Gregg, Fordham, N. Y., to the Strawberry Hill Kennel, Leicester, Mass.

Norah Rock. Irish terrier bitch, by Dr. J. S. Niven to Mr. Aug. Jay, Nova Scotia.

Tim, Irish terrier dog (Aileen—Rock), by Dr. J. S. Niven to Mr. Henry Young, New York.

Erin Badger. Irish terrier pup, by Dr. J. S. Niven to Mr. Henry Young, New York.

Brahmin—Dolly whelp. Black spaniel, by Dr. J. S. Niven to Mr. Thos. Myers, East Saginaw, Mich.

Bayonne, Burgee and Victor. Rough-coated St. Bernards, two bitches and one dog, by Rev. J. C. Macdona, West Kirby, Eng. (through the Neversink Lodge Kennel), bitch Baronne to Mr. Pope, Boston, Mass.; bitch Burgee to the Chequasset Kennel, Lancaster, Mass.; dog Victor to Lieut. Ward, Newport.

Laverack Chief. By Mr. H. C. Waddell (through Neversink Lodge Kennels), dog Laverack Chief to Major Platt, Bangnor, North Wales.

Croxteth—Dolly whelp. By the Neversink Lodge Kennel to Mr. Lynch, Newburgh, N. Y.

Fairy. Pointer bitch, whelped Jan. 1, 1884 (Sam, Jr.—Quilley), by Major Lovejoy, Bethel, Me., to Mr. A. S. Hubbard, Thomaston, Conn.

Cork. Red Irish setter dog, whelped March 14 (Ned Elcho, A.K.R. 984—Bridget O'More, A.K.R. 964), by Major Lovejoy, Bethel, Me., to Mr. A. S. Hubard, Thomaston, Conn.

Dash. Red Irish setter dog, whelped March 14 (Ned Elcho, A.K.R. 984—Bridget O'More, A.K.R. 964), by Major Lovejoy, Bethel, Me., to Mr. A. P. Stuck, Otsego, Nich.

Help. Fawn and white collie dog, whelped June 22, 1883 (champion Ayrshire Laddie—Lizzie), by Mr. Jas. Lindsay, Jersey City, N. J., to Mr. H. Belknap, Sweetwater county, Wyoming Ter.

Major. Sable and white collie dog, 6mos. (champion Rex—Jeannie Nettles), by Mr. Jas. Lindsay, Jersey City, N. J., to Mr. G. B. Grinnell, New York City.

Fido. Black, white and tan collie dog, whelped Sept. 15, 1882 (champion Rex—Beauty), by Mr. Jas. Lindsay, Jersey City, N. J., to Mrs. Barker, Williamsbridge, N. Y.

Ivanhoe. Sable and white collie dog, whelped Aug. 4, 1883 (Robin Adair—Lark), by Mr. Jas. Lindsay, Jersey City, N. J., to Mr. Thomas Willing, Warwick, N. Y.

PRESENTATIONS.

Rifle and Trap Shooting.

ARMY RIFLE PRACTICE.

THE DEFECTS AND OMISSIONS OF THE PRESENT SYSTEM.

Editor Forest and Stream:

Having had something to say about the faults of the army system of target practice, perhaps you will indulge me in a few remarks upon modes and methods that I consider better, stating at the very outset that I can hardly present anything very new, novel or startling, but only such ideas as my experience and reading dictate.

To give my ideas I must necessarily follow and criticise our present system to some extent, in order to point out by contrast what I claim should be the proper system. The germ of our present system lies in "Laidley's Rifle Firing," and passing over all preliminary instruction as probably as good as any that can be given to establish the elementary principle, and therefore needing no criticism, we come to the application of those principles in practice upon the range.

Right here begins the fault of our system, and let me say that I never believed it to be the original idea of Laidley that such a system should have been developed, and, therefore, the fault is not his, except that he confines the first practice to five shots, whereas I think the first practice should be unlimited in order to be able to teach improvement by each successive shot, while ideas of improvement and errors to be corrected are fresh in the man's mind. By the time five shots have been fired the man may be just on the point of comprehension and success, and could he fire five more his success would be reasonably assured. But, stopping at five shots, and just at this point, before the next firing any comes around, his impressions and recollections are dulled, and he begins again almost at the same point he did the previous day, instead of at the point and with the knowledge and impressions where he left off on that day. Existing orders allow fifteen shots per man at not to exceed two ranges, but the usual practice is to have each man fire but five shots; this obtains because there is not sufficient time to shoot off every man on each firing day up to the limits of fifteen shots, and as each man must shoot his shooting becomes limited to five shots only.

With this exception, had Laidley's system been left alone, we would have been much better off, but, as stated in a previous letter, amplification of his system, under orders from the various Department Headquarters, the vicious system of reports, etc., has caused the first principles of success to be lost sight of, and the men now are crowded too rapidly over the range in order to get as many men with marksmen's, first class men's, etc., scores, in order to have a good showing and a high figure of merit at the end of the target year.

Let us analyze and explain my meaning: Laidley, par. 461 to 467, revised edition, gives the instruction for the first firing on the range at 100yds. He says nothing about 50 per cent., or 66 per cent. in two or three best scores being any qualification such as to warrant the man being advanced and firing at 200yds. In par. 468, he says: "The squad is next practiced at a target 200yds. distant, or *such members of it as have attained the required skill*" (the italics are mine), and right here comes in the vicious order. Laidley leaves it to the instructor's judgment when the man has attained the required skill. The "cast-iron" orders leave the instructor no judgment, no discretion, but the man must be advanced when he has made 66 per cent. for three best scores at this 100yd. range, even though he knows such advancement to be sheer folly and waste of time and ammunition.

Now, who is the best judge of when this man should be advanced, I, who stand and watch each shot fired, observe the errors and try to correct them, see whether the man comprehends and is applying proper principles and is bunching his shots close together somewhere on the target or is scattering them indiscriminately high, low and laterally, or the Department rifle instructor, who, perhaps, never saw either me, my men, or my target range, and who judges from his office, perhaps a thousand miles away? He gets up these orders, he is desirous of emulating with other Departments in the number of marksmen qualified, and he, therefore, with honest enough intentions too, under the system, causes this system to be followed.

Right here let me say that I know the intentions and desires of the instructors are honest, and that these orders result from other causes as well as those mentioned, and, parenthetically, I will say that, to their shame be it said, there are troop, battery and company commanders who are either lukewarm or indifferent to the requirements of target practice, who perform their duty in only the routine manner necessary to keep themselves free from censure, and they cause such orders to be originated; for, without a "cast-iron" order to compel them to exert themselves, they never would advance any one, and their men not acquiring any enthusiasm from example, and becoming disgusted with their want of advancement, "shoot and shoot, and don't hit," because they shoot in the same routine manner, simply to get the duty done, and back to their quarters, where they can read, and loaf and smoke.

But are such orders just? Is Captain John Smith to be bound down and held to an order he knows to be folly, and that does not instruct, simply because Captain Tom Jones is lazy and indifferent, and wants "punching up," finds target practice "distasteful," and not in accordance with his ideas of "dignity?" I say the order is eminently unjust. What have we post commanders for except to see that Captain Tom Jones does his duty and does it properly, as well as Captain John Smith? If post commanders are also lazy and indifferent, then what more important duty have the Department commanders to do than to "punch them up," and "ride them around with a watering bridle and pair of spurs" until the laziness and indifference is taken out of them. What have we inspectors for except to look into such things and "haze everybody around" that does not show competence, efficiency and interest in his profession? If every one was compelled to perform his duty properly by proper means, then neither I nor any other commander would be compelled to follow such an order as those given, laying out a programme that we know is not conducive to the best results in the simplest way.

Let us see what riflemen in civil life think about the efficiency requisite to be advanced from one short range to the next, as well as what my experience and judgment would dictate.

Every book I have ever read that gave methods of becoming experts in rifle shooting, lays great stress on preliminary instruction, and requires as near perfection in the preliminary exercises as possible before advancement is made, in order to properly ground the rifleman, give him confidence as well as familiarity with all the requirements of successful shooting, so that intuitively he always shoots properly and accurately at the shorter distances, and, therefore, makes more rapid advancement when he comes to shoot at those longer. Every rifleman knows that constant practice at short ranges is beneficial even at the longest range, not only from the hardening of muscles to the exercise, but the confidence acquired by the skill developed. And does 66 per cent. in three best scores give such training? Is the man ready to go back to the 200yds. range and do anything successfully who only has such qualification? Would it not be better to keep the man at the 100yds. target until he can do better, correct all his errors, and average 80 per cent. before being advanced? And when he is so qualified at 100yds., would he not then be prepared to succeed much more quickly at the 200yds. range, overcoming the increased distance, the apparent diminution of bullseye and target, and, from his training and steadiness, in a fewer shots again make a higher average? Instead of being a "smatterer," would he not soon become an expert, able to put his bullets where he pleased, instead of as now once in a while, and, as the result of hard effort, making 80 per cent.?

Instead of being a high, impossible average to obtain and maintain, I claim that 80 per cent. at 100yds. is rather a low one with our present 8-inch bullseye and 26-inch center ring. I think I can hear many riflemen say that any competent shot should be able to hit the bullseye from twice to three times out of five at this distance; but I put the average at 80 per cent because that is the best we can expect from the average man in the ranks, some of whom unfortunately are slow of comprehension, awkward in their attempt at anything, and from whom nothing else can be expected. Patience and perseverance overcome their difficulties so as to teach them to "bunch their shots" somewhere on the target, then to get them all into the 4 ring, but perhaps never succeed in getting them into the bullseye. Better this than any such scattering five as may make a 17 out of 25 and so make the required percentage for advancement, to go back to the 200-yard range and scatter so badly as to miss the target, and always be a "scatterer," even though the magical 80 per cent. is sometimes made by confining the scattering to the 4 ring. With such careful instruction and average requirements as I have mentioned, the rifleman should soon become a good shot, off-hand; but when he comes to the 300-yard range a new difficulty presents itself, which, to be overcome, needs an entire change of method.

The 100-yard practice gave him steadiness for off-hand shooting, so that he soon acquired skill at 200yds., and if allowed to try it, would soon have also acquired off-hand skill at 300yds. When I first went back to the 300-yard target, although I could make 80 per cent. or more three times out of five at the 200-yard range, and could, standing, do almost as well at the 300yds., yet I found I had something new to learn, and that too at 300yds. distance. My off-hand practice had taught me steadiness with my left elbow unsupported, and all my deviations were in a vertical direction; hence I had only this deviation to combat.

When kneeling, however, I found, my left elbow being supported, that all my deviation was horizontal; my left hand and arm would swing to right and left in spite of all I could do, and at this distance the target was hard to hit. The bullseye appeared very small, and the width of the target very narrow, and but a slight horizontal deviation carried me off the target. My first score was five "goose eggs," followed by 3, then 8, and so on with small scores for over eighty shots before I made 80 per cent. and a marksman's score. After I once "caught on" I had no further very great difficulty, but I am satisfied that I would have overcome my difficulties sooner had I been allowed to take the target at 200 yds. range as a place for my preliminary instruction in kneeling, the same as the 100-yds. range was my preliminary to the 200 off-hand; I would then have commenced a new position and new instruction at the same range where I had acquired skill off-hand. I would have not had 100yds. added on to the difficulties to be overcome in the new kneeling position, and I would soon have acquired skill in shooting kneeling at this distance, so as to again have averaged high there as I had previously at 100yds. before shooting at 200, and when I went back to the 300-yard range I would only have had the distance to overcome.

But the order and system prevents this; it does not recognize the fact that although off-hand practice is beneficial and gives a man steadiness everywhere, there is nothing new—except the greater distance—to be learned when the man begins to kneel. It only recognizes the increased distance and teaches that the kneeling position is given as the steadier position to be taken because of this increase of distance, and that before this new position has been learned and the new conditions of steadiness have become familiar. True enough it is that the kneeling position is the steadier when known; but who will say that the recruit can take it properly, and shoot properly from it, until he has had time to become familiar with it? Would it not be better to try and learn one thing at a time, "make haste slowly," and advance much more rapidly in reality than is the case now?

Then the system and order exacts another thing. No matter what a man's individual peculiarities may be, or what the condition of his strength, nerves or eyesight, of which only the instructor personally present can judge, he must follow the order. He must make a certain percentage at each lower range before he is advanced to a higher, when perhaps his ability to shoot at short ranges is a minimum or even a minus quantity, while he may be able to make a fair or even an excellent shot at longer ranges, could he only be allowed to go back there and try it. But his commander and instructor has no discretion, cannot place him at the longer ranges because he has not "qualified" at the shorter, and the man is never a good shot anywhere because he is unable to succeed at short ranges, and therefore never has the chance to try at the long. I have just such men in my troop. They cannot, from some individual peculiarity, succeed at 200yds; they therefore never have the chance to try beyond, never have a chance to learn to shoot kneeling and lying, where the peculiarity would be overcome, and hence they stay poor shots always for want of opportunity to learn the conditions necessary to be learned at the distances and positions where they could learn.

Again the orders and system are at fault in that they give no discretion to the instructor in the handling of his men under various conditions of weather. To-day may be my day to shoot, but it may be a day eminently unsuited for practice at 200yds., where the man is buffetted about by the wind that is blowing. True it is that men should learn to shoot in all winds and weathers at all ranges; but we must "creep before we can walk," and to-day it is blowing too hard for the off-hand range, and yet when lying down, good shoting can be done, and experience gained that will be of value to all.

But my men have not qualified at the short range, therefore they cannot be put to shoot at the long range, where they can lie down and be steady in the wind. Shoot at 200yds. they must, or not shoot at all, and if they do shoot, which will be the exception and not the rule, there will be so much powder and lead thrown away uselessly, so many shots used up from the total allowance per man per year, so many the less on which to continue instruction, and no advantage gained, because they have not yet advanced enough, from first shooting in light winds to have learned to acquire steadiness in the heavy breeze that is blowing.

I claim that our orders and system should recognize the fact that is known to all riflemen, namely that there are three styles of shooting, almost entirely distinct from each other, and while some can succeed equally well in all others cannot, and each commander and instructor be given the necessary use of his judgment to place the man where he can succeed the best. Short-range or off-hand, mid-range or kneeling, and long-range practice have each peculiarities of their own, and because one succeeds in one is no criterion that he will succeed in all, or because he fails in one no sure sign he will fail in all. And would not the man who can shoot at 600yds. be more dangerous at that distance than a man who can't, and who can't because he never learned from having failed at 200? The times when he will shoot at 200yds. against an active enemy may be and probably will be few and far between, while he may be called upon frequently to exercise his skill or show his want or it, at the longer distance. Let me quote Mr. Farrow on this point:

"I do really think it far easier to become an expert marksman at 800, 900 and 1,000yds. than at the shorter distance. In the former the position allowed the marksman is such that, after some practice, the rifle can be held as steadily on the bullseye as though fired from an artificial rest, and it is easier to become expert in estimating the varying forces of the wind and changes of light, which are the principal difficulties encountered at these distances.

"It is easier to do that I will say than when a marksman is standing in the open, with no rest for his rifle but his own strength of arm and nerve, to maintain a steady hold upon the bullseye, bringing the pressure on the trigger with sufficient force to cause the discharge at the right instant, and following this in successive shots to the fulfillment of a complete score. Ah, yes! I could name you many who, with the experience of one season at the long ranges, have become so proficient that scores with but few points off from the 'possible' have been repeated many times, yet these same gentlemen, after years of practice at the 200yds., had become only medium in proficiency."

My experience and observation exactly agree with the above, so far as I have observed, up as far as we have ever shot at the long ranges, and the same doubtless holds true up the longest, and we therefore see that probably many men would succeed in becoming fair shots at the long ranges for all they may have failed at the short, provided they only could get there to shoot, and I would be glad of the authority to give me the use of my judgment and discretion to use in developing men as shots where they can succeed and not have to keep them hammering away at a range where it is perfectly evident they cannot, and the waste of lead and their own discouragement and disgust as shots. And proper classification can be given such men also; they could enter into their proper place in the figure of merit of the troop, battery or company; would have their usefulness on the field of battle, and probably from the encouragement received from their success at long ranges would finally succeed at the short.

But there are other kinds of shooting necessary to the field of battle, and so far our orders and system have not developed them. We have seven targets to shoot at, calling for different styles of firing at fixed objects, and two calling for firing at moving or vanishing objects, and yet I have never seen but three of those nine targets, much less fired at them.

Beginning as we do at 100yds. at the beginning of each target year, and "dragging the men over the ranges" to make marksmen for "glory and buncombe," there has never yet been time to give the attention to anything else but the regular range firing up to and to include 1,000yds, in some few cases, generally only up to 600yds. Skirmish firing, than which there is no more important training that can be given, receives no attention whatever, except at the annual competitions by a few men selected to compete at Department, Division or Army contests, and perhaps even by these men for the first time in their lives, because why? Because all their time and energies have been devoted to making successful shots and marksmen on the regular ranges, and there being no comparative excellence established, and skirmish firing not entering into any classification, qualification or figure of merit, it is viewed with indifference, because it does not help Captain John Smith's company to excel and take a high stand as compared with that of Captain Tom Jones's company in the target reports.

I have been shooting at army target practice off and on since 1879—when first Laidley's system was inaugurated—and I have never seen targets D, E, F, G, or either the movable or vanishing targets, and have never seen skirmish firing except at target B, in competition at Department headquarters.

Laidley, par. 473 to 487 inclusive, gives the instructions for file, volley and skirmish firing, as well as at movable and vanishing targets, and an examination of these instructions shows a good system, except that only ten rounds annually are required at skirmish firing, at distances from 400 to 200yds., showing how little importance was attached to this mode of firing by him; and but little more encouragement has been given by the supplemental orders on the subject, G. O. 53—A. G. O., 1882, only mentioning skirmish competitions from 600 to 200yds., and that "skirmish competitions will be encouraged and should extend to ranges of 800, 900 and 1,000yds."

How can men compete who have never been trained at this firing? I was a competitor last fall, and I never had fired before as a "skirmisher" in my life. All my time had been spent on the range from 100 to 600yds., trying to follow the orders, and I had had neither time nor opportunity to practice as a skirmisher. I had even been refused permission to build a long range up to 1,000yds. to exercise the men at long-range firing up to this distance, even although Laidley and the orders state that "marksmen will fire at targets up to 1,200yds. range," and I was therefore debarred from any chance to practice as a skirmisher, as long-range practice for marksmen comes first in order and importance in the system and orders.

Another vital fault in the system and orders is the want of recog-

nition of the calvaryman and his carbine. The system and orders are all based on the infantryman with his rifle, and yet my troop of cavalry, with their carbines, has to compete for excellence in figure of merit with all the infantry companies in the Department, and receive censure if it does not come up to what is considered a fair degree of excellence, the infantryman with his rifle being the standard.

Now for firing on foot I hardly think there is any rifleman who will contend that the same average excellence can be obtained from a gun with a 32-inch barrel, 16½ inches between sights, and with 55 grains of powder and 405 grains of lead, as from a gun with 32½-inch barrel, 26½ inches between sights, and with 70 grains of powder and 500 grains of lead. At short ranges the shorter piece may be held more steadily by some men; but I have used both, and I know that for all distances the rifle is to be preferred as the more reliable weapon. Good shooting can and has been made with carbine, but better with the rifle, and such will always be the case, for reasons well known to every rifleman and not necessary to mention here.

The carbine is not recognized by Laidley except by a description. It is not recognized in any orders except for mounted practice, and it is excluded from all Department, Division and Army contests, even though perhaps it is the only weapon the competitor has ever shot with. Practice on the range even, with the rifle, soon begets a want of confidence in the carbine in the cavalryman's mind that is fatal to his success in the field, where he can use nothing but his carbine; and therefore cavalry commanders keep the rifle from the hands of their men, knowing that efficiency in the field depends upon their knowledge of their own arms, and in range practice try to beget confidence in and give knowledge of the carbine alone.

It is useless to say that a good shot or an expert can shoot equally well with any weapon, and that therefore the weapon is only a matter of branch of service. A good or an expert shot with a carbine has got to learn to be one in it, and success in the field with it, and a good shot with the rifle would have to use and learn the carbine also to succeed. It is granted that an expert can soon learn any weapon different from his accustomed arm, but he must learn it all the same, and become accustomed to the difference of balance, of recoil, of degree of elevation, etc., before he can hope to succeed.

Is it not, therefore, unjust to classify and qualify and compare cavalrymen and infantrymen by the same standard? Is it not folly to expect that cavalrymen who have never shot with a rifle can be expected to go to one of the annual contests, take a rifle for the first time in his life, and try to compete with men who have never shot with anything else? Last fall I saw disgusted cavalrymen for just such reasons; they had to take a new and strange arm, a kind they never had shot with before, and in three days' practice be supposed not only to learn the new arm, but miss the individual peculiarities of the particular weapon they had never seen before, and be ready for the three days' competition.

That cavalrymen have ranked high on Department, Division and Army contests is very true, but they were exceptional shots; and not only that, they had had long practiced with the rifle before they ever entered the competition, and shot with the same rifle they had used before and knew thoroughly.

From what has been thus far written in this and previous letters it is perfectly plain that I do not agree with our present system in any of the points thus far mentioned, and I will now discuss the perhaps greatest of all faults, namely the "qualification" and "classification."

Laidley, par. 532, states what such qualification and classification shall be. He says nothing short of being 80 per cent. for either two or three best scores at 200, 300, and 600 yards that makes a man a "marksman;" and my first idea on reading his book was that it was to be 80 per cent. of the "maximum possible" for all the shots fired at each of the three ranges during the year, and the same for the 66 per cent. necessary for first class men, and 50 per cent. for third class men. But orders have since defined this to be as it now is, and as before stated, no account is taken of the worst shooting.

That 80 per cent. is a high average for all the shooting at each of the three ranges I very well know, and so have shown; but cannot something more real than three best scores be taken as the necessary qualification? Cannot we have something that on its face tells the exact truth? And if a proper system from the 100yd. range up is followed, will it be so very hard to classify men on their average even though it be lower than 80 per cent., as may be shown by experience to be necessary? We have placed the man at 100yd. range and have kept him there until he began to show some evidence of proficiency, as a preliminary to his shooting at 200yds. Suppose now, when he goes back to 200 we give him a certain number of shots as preliminary practice at this range, during which he learns the elevation necessary, becomes used to the diminished size of the target and bullseye, etc., and then put him on his record, each shot to count in his annual classification and qualification, will he not try harder with every shot and not throw away a single one for fear it will spoil his average? And if he should make a "3" will he not try harder for a "5," in order to balance it and keep up his average if still kept at 80 per cent?

The same way he should begin his preliminary kneeling at 200yds., keep on firing there as has been done familiar well by the new position—but not for record in his 200yd. off-hand score—then be given a certain number of trial shots at 300yds., to there learn his elevation, etc., before he begins to shoot for record. And this same can be carried through all the ranges.

Then why should a man go back to 100yds. October 1 and begin again? If he has been properly grounded here, as he should have been before he ever fired a shot anywhere else, he needs no more practice there, and he should progress onward on October 1 from where he found himself September 30. True it is that some date is needed as ending the year and to make reports, classifications, etc., but because a man has failed to make his qualification good by midnight September 30, is he to go back and lose it all on October 1? Is he any the less a marksman because he failed to get in his last score on time, but would have gotten it in on October 1 if he had had the chance to do it? True, he cannot be classed as a marksman for that year on the reports, for the reports bar him out, being made from what was the fact September 30; but could his credit not be carried over to the next year, and he be given the benefit of it so as not to have to go back and begin over? So that if he does not come in on this year he can on next, and his certificate would show the fact that he was from Oct. 1, 1882, to Oct. 1, 1884, making his record, or whatever two or three or four years he qualified in.

It is this continual going back which bars out so much necessary practice. We "travel around in a pint pot" during the entire enlistment of the man and never give him a chance to progress. We keep on trying to perfect what should of itself have shown perfection, instead of going on to better and higher styles of shooting to obtain perfection there as well.

My idea is that once a proper marksman always a marksman, and then pass that man on to the longer ranges, or to more difficult feats of marksmanship at movable and vanishing targets, as a skirmisher, etc., believing that there is no fear that his short-range work will ever fall off: for there will be days when the wind, light weather, or what not, will preclude him from long-range or difficult practice, and he can then devote himself to short-range work to "keep his hand in."

Neither does our system recognize the fact that the *personelle* of our army is constantly changing. Fresh blood is coming in continually. There are constantly new men to instruct and take through preliminary training, and time should be given to them, leaving the old er and experienced shots to go on with their work which they have learned, and for which they have received instruction. More attention could then be given to teaching the new men, to bring them up to the same efficiency as the old, and more rapid advancement made from not having needless work to go over.

The recent orders raising the qualifications on which to qualify marksmen, etc., are, to my mind, not in the proper spirit. Increased efficiency means the retaining of the same men who acquired proficiency under the old qualifications. How many men are there left who entered it five years ago, and who last year helped swell the list of marksmen? Many, if not the most, of them are gone, and a higher qualification is set down for the recruits who take their places, and not for those who were discharged and who, perhaps, never will fire a shot again in the army.

As it affects officers it is all right, for they are in the army for life, and constant increase in efficiency should be demanded. If I made myself a marksman last year on two best scores, it is to be expected that this year I can again become one on three, next year on four, and so on; but then I do not expect my discharge until I resign, and I am not in the same category as the man who is in for five years only.

If the qualification had been raised for all those men who have yet one year to serve, and who had previously qualified as marksmen, perhaps there would have been some utility in the order; but as it is, it only increases and extends the errors of the present system, with but very little benefit to the service. It would have been better, to my mind, to have raised the qualification by including efficiency at skirmishers', movable and vanishing targets, and so have inaugurated the progressive system so badly needed.

Another point is that no allowance is made for the various climates in which our army is scattered. By a positive order the practice at this post was arbitrarily stopped last fall long before bad weather set in and when there were yet many weeks of fine outdoor weather to be expected. All this fine weather, which lasted for nearly six weeks after the cessation of practice under the order, was so much time lost on the ranges. Men who were just ready to complete their practice by successful shooting at longer ranges were arbitrarily debarred from so doing, and the time has been irretrievably lost.

Discretion should be allowed in this very matter in order to enable those who know the climate they are stationed in to be best taken advantage of. Our spring at this post is very late, and no dependence can be placed on weather being suitable for practice much before June 1. "By order" target practice begins April 1, and there was not a single proper target practice day in the month, either this year or last, on the days set apart for target practice, and I have had but two so far this month. Perhaps it would be just as well if I did not have any now until the weather has fully settled, for Laidley says "the firing, however, when fairly begun, will continue on successive days, and long intervals between the firings will be avoided," and bad weather makes long intervals at times.

The 30th of September should make no difference in the practice. That date or any other can be taken as the time on which to render reports, classify, etc.; but men should be kept on with their individual practice from where they may be on that date, striving onward for something higher and taking advantage of every fair day until winter actually stops it. Even during the winter there are many fair days when men need not be bundled up, and they should be required to take advantage of them to have to shoot under any and all circumstances under which battles may be fought. Unfortunately we have not yet that control over wind and weather so as to preclude the idea of ever being required to fight in rain, cold wind or snow, and if progression was the rule instead of retrogression, we would soon be able to acquire efficiency under these disadvantageous circumstances instead of always being "fair weather shots."

In the South, where the weather is open the year around, out-door practice can be had at all times. They of the South should therefore be much more efficient than we of the North, where snow flies for at least six months in the year. The best we can do is to keep up our gallery practice and so keep up efficiency, so as to be ready to take hold again when spring opens, where we left off in the fall. But any out-door practice we may be able to catch should count, and any scores made at any time during the target year from Oct. 1 to Sept. 30, should be accredited to the marksman. In this Department such is not now the case, and we are debarred all credit for scores made between certain dates.

Again, the system and orders, so far as they affect cavalrymen, are very defective in the means and methods for exercising the men in mounted carbine and pistol practice. Laidley does not recognize any mounted practice at all, and G. O. 57, A. G. O. 1882, is the nucleus about which all the mounted practice centers.

Much has been written much better than I can express it, upon mounted practice, and much has been done, particularly in the Department of California, in this practice; but if competition and rewards are necessary to produce excellence, as would seem to be the case from the methods adopted for dismounted practice, then this mounted practice is unrecognized, and it is only for the love of the thing and for the sake of proficiency in the field that any success whatever has been obtained, as well as its being in spite of and not because of the modes and methods recognized by orders.

As before stated, G. O. No. 57, A. G. O. 1882, is the basis, and it starts out by "taking Laidley's 'Rifle Firing' (second edition) as a guide, so far as applicable to the above named arms," while, as before stated, Laidley does not recognize either of these arms—the carbine and pistol.

Then follows the method to be followed. The degree of proficiency required dismounted with the carbine should have first been attained (50 per cent. at 200, 300 and 500 yards) before any mounted practice is had, and therefore, it will be seen that there will be men in the troop who, perhaps, will never practice mounted, for, as stated above, the faults of the dismounted system debar a man from the chance to practice at the higher ranges until he has first attained skill at the lower.

I would ask, has dismounted firing anything whatever to do with mounted practice, except the first teaching of familiarity and dexterity in the handling of the weapon, which can be taught and should be taught at gallery practice and the 100 yards range? Has my ability to shoot and make even a perfect score at any range anything whatever to do with my ability to ride a horse and "snap shoot" with a carbine from his back? I say no, emphatically no. Range firing dismounted, as every one knows, who is a rifleman, tends to disqualify a man from rapid aiming and firing; it makes or tends to make a "poke shot," one who dwells on his aim and hangs onto the bullseye until he has just the right pressure on the trigger to ' eed the bullet to its mark—just the very qualities a mounted shot does not want for success in his mounted shooting.

As I take it the very first practice for mounted firing successfully should be to teach horsemanship, with blank ammunition freely used to accustom the horses to the noise, and the men to their seats on a plunging horse, being careful to repress all careless firing in the air or to the ground, as habits difficult to overcome when once confirmed. No attempt should be made to fire at the target until a reasonable steadiness of the horses has been attained, and reasonable proficiency of the men in loading, aiming and firing their pieces from their horses' backs. Then practice at the target should commence, not for record at first, but to gradually get both men and horses accustomed to the new exercise, and preferably with reduced charges.

The order and instructions teach a point with which I am constrained to emphatically differ. This point is as follows: "The gait will be the gallop, but at first the fire will be delivered at a halt, *the trooper pulling up short to deliver it*, and then immediately resuming the gallop." The italics are mine and mark the point.

Now it may be and doubtless is a fact that horses should be trained to stop quickly for any purpose, but I will leave it to any horseman if this is the way to teach them a new exercise when the object is as expressed by the rest of the paragraph of the order: "This will be continued until the men are sufficiently advanced to fire while the horse is moving at that gait" (the gallop).

The horseman will see that the horse's training is lost sight of. This is a new exercise to the horse as well as the men. He may have become used to the noise by the preliminary practice with blank ammunition, but he has never yet been ridden at a target, for this preliminary blank cartridge firing has had no targets but from men in line, in column of files, on the skirmish line, etc., while exercising at the regular company, or platoon, or skirmish drill; the horse, therefore, sees a new object, a big white target, which of itself is hard enough to ride him at until he is familiar with it, he has every inclination to stop, and by the order he is taught to stop, so that he soon falls into the habit of halting from the gallop as he sees the man raise his piece to fire.

The object being to fire while the horse is in motion, my method (and I claim no originality for it, for it is the method practically of the cowboy or Indian brought down to practice for the men) would be to place several targets on a line, one behind the other, and with sufficient distance between for the man to be able to reload after firing at the first, before he reaches the firing point for the second, and so on, and then to move the men out individually or in columns of files and teach men and horses at the same time to keep up their gait and to fire at each successive target as the firing point for each is reached. Both men and horses would soon thereby learn and both would soon acquire steadiness and proficiency, and the horses would learn no habit of halting as they saw either the target or the man raising his piece to fire. The horse would only learn to go ahead under control, and after he had learned steadiness in this he could then be taught to halt in order to be perfectly trained for the exceptional case of a shot to be fired from a halt.

The trouble is, in all the orders and instructions, that our men and horses are supposed to be trained, and that only the necessary skill of the men is to be sought for in firing under new conditions. Unfortunately, however, our men are much more accustomed to the pick and shovel, and familiar with their use, than they are to their seats in the saddle and to riding and training their horses. The horses, too, are badly trained, or not trained at all, from the infrequency with which they are ridden, and they need as much training as the men.

With the pistol, dismounted practice is only first needed to acquire dexterity in its use and handling. Drills in pistol manual should be as much a part of pistol practice as "aiming and pointing drill" are parts of dismounted carbine or rifle firing, and thereby quickness in loading, in cocking, in aiming and in firing properly can be taught. But the pistol is only a weapon for mounted work, and everything should be made to tend to its legitimate use, and after skill in handling has replaced awkwardness then mounted practice should be exclusively followed, for he who can successfully snap-shoot from horseback can be reasonably expected to shoot well when on foot, as he may be called upon to do in exceptional cases.

But from what I have said is it not sufficiently clear that our system and orders need overhauling? Is it not plain that, even so far as affects infantry, who have only one weapon, a better system can be devised, and when cavalry is considered with their four styles of practice—carbine and pistol, both mounted and dismounted—something more rational is required? I have to have four target practices a week to the infantryman's two a week—two dismounted for carbine and two ditto for pistol. When the men become well enough trained at dismounted practice I will have to have two more to give the mounted practice required, and yet keep up the dismounted practice to make marksmen first and second class men and a high "figure of merit" in competition annual reports, as well as to teach the skill now supposed by order to be required before a man can practice mounted. That will be six target practices a week to keep my end up and stand well in annual reports and yet acquire the necessary proficiency for my legitimate work as a mounted man. Understand I am not complaining as to the amount of work, for that is what I am paid for and what I take delight in, for I would rather drill than not if I only could get the men to drill; but is it any wonder that some of it is sighted and overlooked when it is understood that it is like "pulling eye teeth" to get the men for the work? Is it any wonder that that which is recognized by a cast-iron order is what receives the most attention? Is it any wonder that that in which there is no competition or reward is neglected for that in which there is?

I believe in emulation when properly regulated, as much as any one; but I do not believe in "bunncombe." I believe I should be required to teach my men skill and proficiency both mounted and dismounted; but I also believe I should be given a reasonable method with which to do it—and reasonable competion for which to strive. Why cannot the annual competitions and reports be so arranged as to recognize me as a cavalryman, and my horse as a well-trained cavalry horse? Why should I compete dismounted with an infantryman with his weapon and he not compete with me with mine? Why should I not be placed on a basis of my own, and compete with cavalrymen as cavalrymen—both with carbine and revolver? Has not the time come for cavalry to be encouraged and brought up to the state of efficiency required by modern modes of warfare? Am I to practice as a dismounted man simply, and acquire skill to compete with infantry on foot, when my legitimate place is in the saddle, using the weapons with which I am provided with all the excellence attainable? On the field of battle has cavalry lost its usefulness, or are there not possibilities for its being put to a new use, and with carbine and revolver raining lead upon an enemy to perhaps save a battle?

I am a marksman by our system, but I am also a cavalryman and much more proud of that. Let us cavalrymen therefore have a system that teaches us efficiency in our legitimate field. We will not be any the worse for it when we should find ourselves "fighting on foot," and we would be what we should be when mounted, instead of the mounted "mob" we now are.

C. D.

FORT MCKINNEY, Wyo.

RANGE AND GALLERY.

THOMASTON, Conn., June 4.—Yesterday several members of the Empire Rifle Club went to Collinsville to shoot the first of a series of matches with the Canton Rod and Gun Club. The terms of the match were for teams of ten men each, ten shots per man, distance 200yds., Massachusetts ring target. Following are the scores:

Canton Team.

C B Hull	11	11	10	11	10	12	11	11	12	9—108
J Laubenstein	12	11	12	9	10	11	7	11	12	10—105
B C Higley	9	10	12	11	6	12	11	9	11	12—103
J H Bidwell	9	9	10	12	10	11	8	11	9	10— 99
S J Lyon	9	10	10	9	8	10	9	11	10	10— 96
J D Andrews	10	10	8	8	10	9	8	9	11	12— 94
G J Case	7	12	8	8	7	11	10	9	11	11— 94
G Barbour	7	10	12	5	10	5	10	8	12	11— 90
J B Flint	11	11	8	8	9	9	9	8	11	4— 88
G F Lewis	11	8	8	7	10	11	8	11	7	4— 85—962

Empire Team.

G Canfield	9	9	11	10	10	11	11	12	10	8—101
E Thomas	8	11	8	8	8	11	9	12	10	11— 96
A S Hubbard	7	10	10	11	10	8	6	11	11	11— 95
F Carr	8	12	9	8	6	10	12	9	10	11— 95
W H Dunbar	12	11	6	9	9	9	10	9	10	8— 93
C F Williams	11	7	8	10	11	9	11	12	5	9— 92
G Gilbert	5	9	11	7	10	10	12	8	10	10— 92
E Bennett	8	7	9	9	12	7	12	8	11	8— 91
G Lemmon	6	8	10	7	12	7	9	12	9	11— 91
G P North	6	9	9	6	10	9	9	4	9	9— 80—926

This was the first match the Empire Club ever shot, and no member ever took part in a match before.

At the weekly shoot, for some unaccountable reason the scores were very low. W. H. Dunbar won the badge with 95, C. F. Williams scored 92, F. Carr 91, G. P. North 88, G. A. Lemmon 85.

BOSTON, June 7.—Had it not been for the intense heat to-day the few shooters at Walnut Hill would probably have rolled up great scores. The attendance was small, as is usual after a semi-annual meeting, but the shooters had good weather conditions. Mr. Cushing put up two scores of 46 in the Creedmoor match, and in the rest match Mr. Berry had a fine chance to test his new 32-cal. Maynard. He scored a fine 97. Next Saturday there will be a match between teams of the Massachusetts Rifle Association and the Manchester Club, by telegraph. Following are the best scores to-day:

Creedmoor Match.

C E Berry	5455555544—47	W H Oler	4545554445—45
Re-entry	4555445455—47	S B Spooner	5544455544—45

GARDNER, Mass., June 5.—At the regular meet of the Gardner Rifle Club at Hackmatack Range yesterday only a half dozen of the members found the target. The American decimal was used, distance 200yds., shooting off-hand, with a possible 100. The following is the score:

G F Ellsworth	10	9	9	10	6	10	10	8	9	9—90
I M Dodge	9	9	9	9	7	8	9	10	7	7—85
A Mathews	10	9	8	10	7	7	9	6	9	9—84
W C Loveland	9	8	9	10	8	8	10	10	7	10—81
G C Goodale	9	9	6	8	10	9	10	9	10	6—74
H G Hicks	6	7	8	9	5	6	9	7	4	6—66

JAMESTOWN, N. Y., June 6.—The following scores were made today at the regular medal shoot of our rifle club, Creedmoor target, 200yds., no wind and bright light.

H Y Perry	5455454445—45	A F Ward	5533444444—40
Geo Shattuck	4344544444—40	A F Warner	4453444435—40
H A Ahlstrom	4444444444—40	R H Burns	5544444440—38

NEWARK, N. J.—The shooting festival of the Newark Shooting Society opened Monday last at the Shooting Park, and continued four days. The target of honor was open to members of all societies that had contributed prizes, each shooter obtained but one ticket and one prize. The principal prize which was offered on this target is $100 contributed by the society. On the ring target $450 will be distributed in 20 prizes; also premiums as follows for the best three tickets: $2, best three tickets; $3, best three tickets. On the main target the total amount of prizes was $275. The best target of the day was the bullseye, on which $450 was divided—for the best three bullseyes, for the second best three bullseyes, and for the third best, and so on.

FITCHBURG, Mass., June 4.—The following gentlemen were the successful competitors for the six prizes offered by G. W. Parsons, to be shot for in his rifle gallery, for the month of May. Target, 200yds., reduced to 20yds., 40 shots possible 400: Prof. C. J. Becker 397, C. C. Cutler 396, H. C. Kendall 391, W. P. Churchill 378, C. L. Jael 371, E. J. Whitney 369.

BLOOMING GROVE PARK.—Match shot on Decoration Day for prize medal:

Nason	3	43443—18	Smith	2	00033— 6
Hughes	0	22330— 9	Dillingham	2	000
Van Gelder	2	23033—11	Vyse	3	23425—16
Fielder	0	00002— 2	Hodgman	3	24244—16
Baldwin	0	00332— 9	McCord	4	03201— 7
Dennis	3	43343—17	Post	0	24232—13

BELLEVUE, O.—Gallery shooting; range, 67ft.; 7/10 bullseye, 1/10 rings, paper targets; 10 shots in succession, possible 100. Average percentage for April and May: Bodette, 89.5, 86.7; Wollenslagel, 87.1, 86.6; Ebertshauser, 87.4, 87.3; Aigler, 84, 86; Sherk, 78.6, 84; Yearick, 78, 82; Webster, 75.2, 82.5; Gera, 84.6, 82; Lewis, 81.6, 84; Mayne, 78.5, 80; Headings, 87, 79.8; Higgins, 82, Thornloe, 72.3—H. E.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

A CLAY-PIGEON PUZZLE.

FREQUENTLY when the clearing of the smoke shows to the disappointed hunter the frightened bird unhurt, only hastened in her flight, he is conscious of a degree of surprise mixed with his disappointment. He has felt sure that he was cool and held where he wanted to, and the result should have been an addition to his bag and the satisfaction arising from a thoughtful, successful shot.

Anxious to find the fault or occasion of the miss, I think generally it is forced upon him that his judgment was in error. If really he thought he was right and if really he was cool enough to do as he thought was right, it is clear that in the judgment was the trouble. There is great chance here for many a failure, and I think that a certain natural gift, an intuitive knowledge of, or conception of, successful conditions is what places many an one easily first among his circle of sportsmen acquaintance.

An error in placing the distance of your game, the direction and swiftness of flight, is sufficient to count a miss even before your fire. Experience develops increased capacity, and so young hunters, who have everything to learn, gradually become accomplished Nimrods

and can talk of their long and wonderful shots instead of having only failures and "try, try again's" to mourn or laugh at.

But I confess that I am somewhat surprised when many of these conditions of uncertainty are removed—when, within certain limits, a uniformity of conditions is assured—that so many good marksmen fail in making more and nearly perfect scores.

I refer to clay-pigeon shooting. In this sport, it is an assured fact that the target will start from a given spot, and that it will start at a known and arranged instant, and that in all human probability there will be ample time to secure aim and to kill, and that it cannot fly beyond the range of your gun (if you have one which is what it ought to be for such sport). And yet good shots as well as poor ones will miss again and again chances which are all in favor of the shooter, and which at other times they have no difficulty in making.

In other words, I am surprised that there are not more phenomenal shooters, whose scores are continually high and nearly perfect. I wonder at myself that I do not do better; I am amazed at my friends and their failures. Some of us are fairly good shots; we burn a good deal of powder, we are enthusiastic and regular in our shoots, and "go in" for all we're worth to force the average of our scores up near the "clean" line, and we are not as yet happy.

Now, why does not this smashing of the clays become more mechanically uniform and successful to those who shoot continually?

Is there anybody "sure?" and if so will he please "rise in his place" and tell us how he loads, how he holds on or ahead; in fact, just how he does it. It will be instructive and interesting reading. B.

RECEPTION OF THE EXETER TEAM.

THE citizens of Exeter, N. H., turned out to give the victorious team a fitting reception on their arrival from Chicago, Monday, June 2. The Exeter *News-Letter* describes it as follows:

"At 8 o'clock the band, accompanied by a large number of torch bearers, marched to the armory, where the members of Company D had assembled, and the procession was formed. They marched to the depot, where the team found on their arrival a large crowd gathered to welcome them home. Each member of the team was presented with a handsome bouquet, and they were placed in an open barouche drawn by four horses, and escorted in triumph to the square. The road was thronged with people, and their congratulations of the team were enlivened with the firing of crackers and cannon. The band played well, the soldier lads looked finely, the crowd was enthusiastic and the victorious marksmen were proud, tired and happy. Mr. Getchell can congratulate himself on the complete success of the affair, for not a single suggestion of addition or change in the programme could be thought of by the most confirmed grumbler that would not have marred the reception. When the procession reached the square in front of the Town Hall, they found a huge bonfire kindled, Mr. Hervey's house and G. Weston Leavitt's store were decorated with lanterns and the windows of the house filled with admiring spectators. The sidewalks were quickly filled with the crowd, and after the carriage containing the team had stopped in front of the Town Hall, Hon. John D. Lyman made the address of welcome, as follows:

"GENTLEMEN OF THE EXETER SPORTSMEN'S CLUB: Welcome, thrice welcome home! The military and citizens, yea, and the ladies come forth to bid you welcome as victors and to rejoice with you over the blushing honors and triumphs won, while torches and illuminations fittingly light up these scenes of our congratulations. No emotion is more natural to generous souls than that which prompts them to welcome home the victors of heroic or artistic achievements. We come out to-night to welcome the victors, as the Greeks and Romans and every noble people of antiquity were wont to do. If the Greeks, the most cultured of all the ancient nations, and from off whose altars American civilization is now daily plucking live coals to add to the brilliancy of its own enlightenment, thought it not unworthy to compute their time from eras marked by their sports and Olympian games, we may well heed their example in duly developing the wonderful physical powers with which a kind Heavenly Father has endowed us. Greece is scarcely better remembered for her Socrates and Demosthenes than for the marvelous skill of her citizens with bow and javelin. The chisel of Phidias is as immortal as the pen of Homer, and in sacred story the sling of David as the sayings of Solomon.

"Gentlemen, the art of shooting is the art of national defence. It is the art practiced so well by the heroes of the old French and Indian wars, some of whose headstones are hid from view very near where we now stand; and again so well by Gen. Folsom and Light Infantry Poor and their comrades in the Revolution and the later heroes of 1812; and never better than by those whose graves bear fresh decorations and the veterans who are here to welcome you to-night. Long, long may they live to enjoy the land they saved! Were not the barrier between those departed heroes of old and the living impassable, they might be here to-night to greet those who practice so well the art of shooting, by which they maintained the national liberty. As the law of Jehovah came forth from amid the thunder and lightning of Sinai, so liberty had her birth, and is maintained by the thunder and lightning of men who shoot. So far in this bloody world, shooting has seemed to be one of the fundamentally necessary arts, and the same steadiness of nerve and accuracy of sight that hits the glass balls in your contests will cause the nation's foes to fall at our country's call.

"'Do good to those who hurt you,' say you, my good friend Chase. Well, no man on earth ever tortured me worse than you have, Dr. Gerrish. Now I apply the good pastor's rule and say most earnestly, may your joy over this triumph of the skill of yourself and gentlemen of the club be as intense and far more lasting than was my anguish when you applied your remorseless steel to my strongly-rooted molars. Language can wish no greater.

"You, my friend Stark, won the diamond badge. Well, you could do no less and keep up the reputation of that Stark who taught the Indians of our wilds and the red coats at Bunker Hill, and both at Bennington, of his shooting qualities. You, Taylor, may proudly bear the name of him before whose shooting qualities the hosts of Mexico fled in despair. Cooper and Jenkins are worthy of such associates. At Concord bridge, a century since, a few patriots fired shots that were heard around the world as quickly as horses and sails could speed, but Jove flashed your victory over continents and under oceans in the twinkling of an eye. In presence of this vast audience, standing close by the historic spot where the first government upon the American continent in independence of the mother country was instituted, facing the venerable building where Washington was entertained, near by the resting place of heroes of the old and recent times, and in the presence of veterans from battles as nobly fought as any in the annals of time, we pray that your success, gentlemen, in all noble enterprises may be as great as that of your shooting at Chicago.

"Dr. Charles H. Gerrish responded on the part of the club:

"I thank you for the kind reception you have accorded us on our return from Chicago, and can assure you this welcome is for us the proudest feature of our trip. We left here a week ago last Saturday, as you all know, to represent the Exeter Sportsmen's Club at the Ligowsky Clay-Pigeon Match at Chicago. At Worcester we met the club from that city and continued in their company until we left them at Worcester on our return. And let me pause here to pay these gentlemen a well-deserved tribute for the large part they contributed toward making our visit and our journey pleasant. Their kindly wishes for our success and their cordial congratulations when success was achieved will long be remembered by each of us, side by side with this flattering reception you have accorded us. We arrived safely in Chicago, and put up at the Palmer House, where many of the clubs made their headquarters. Tuesday the wind blew a gale, so it was decided to postpone the shoot until the next day. Wednesday morning when I arose I raised the curtain and saw a pennant standing out straight from its staff with the force of the wind. I turned to my room mates—I may remark there were three of us in the room—and said, 'Boys, it blows like the devil. Our chances are good.' We shot and scored thirty-five. It was not a large score—it was a very poor score not one of the teams who were present would have accepted. They would rather have shot. Yet when the thirteenth team finished, thirty-five led the list. The next morning when I arose I looked out of the window and saw that same pennant standing out as flat as a pancake. 'Boys,' said I, 'it is blowing hard. We have a good chance.' We shot and scored thirty-three. It was not a great score. No team present would have accepted it, yet it was enough. The team has taken in prizes over $1,400 in the tournament, including the grand prize of $750 and the diamond badge awarded to the best individual score, valued at $250. I thank you in the name of the team for your welcome home, and hope that in future your welcome will be just as cordial whether we come as victors or vanquished.

"At the conclusion of the doctor's speech, he asked Mr. Stark to arise and let the people see the diamond badge won by him at the tournament. He at once arose, amid the cheers of the large assemblage, and the badge, which was fastened to the white satin ribbon by which Mr. Stark gained admittance to the field, was plainly seen attached to the lapel of his coat. The badge is of fine gold with a large diamond in the center, surrounded by a laurel wreath finished in colors. On the top is a pigeon with extended wings, also finished in color. It was made for the Ligowsky Clay-Pigeon Co. On the reverse side is the inscription:

DONATED BY THE
LIGOWSKY CLAY-PIGEON CO., OF CINCINNATI, O.,
TO C. M. STARK,
EXETER SPORTSMENS' CLUB,
INDIVIDUAL CHAMPIONSHIP,
1ST INT. C. P. TOURNAMENT, CHICAGO, MAY, 1884.

"At the close of the tournament it was at the option of Mr. Stark to take the badge or $250 in cash. He took the badge.

The barouche containing the team was then escorted to the store of Mr. Getchell where they alighted, and the crowd slowly dispersed. At 10:30 the Sportsmen's Club entertained the "team" and a few friends at Hervey's, where a sumptuous repast was served, and an hour was agreeably spent in hearing pleasant reminiscences of the Chicago tournament. Regret was expressed by all present that Mr. Hervey could not entertain a larger number at this time, so that the club could have made the invitations more general.

The club was organized several years ago to shoot at glass balls, which took the place of live pigeons owing to a feeling in the community that the birds suffered during the sport. Before the organization of the club, there was an "annual pigeon shoot" that took place on one or more May days, and the last one was so successful that it was decided to organize a glass ball club for practice. A ground was secured through the kindness of the late Mr. B. L. Merrill, on one of his pastures near Little River, and the same sport was indulged in with more zeal than success. Messrs. Cooper, Taylor and Gerrish were among the early members and have continued their interest in the club ever since. The substitution of glass balls thrown from a trap for birds took every objection from the sport and the club flourished.

After a year or two grounds were secured on the Kensington road, and afterward they removed to the rear of the jail where permanent quarters were established, and the roll of membership increased very rapidly. A club room was secured on Water street where members could meet and transact business or talk over the incidents of the sport. This was, however soon abandoned, and the house on their grounds became their headquarters. About this time the club began to feel strong enough to meet other oragnizations. One of the strongest organizations in this vicinity was the Powow club, of Amesbury, Mass., and with them they tried conclusions several times, but were always overmatched. A short time ago a regular summer shoot was decided upon, and the first proved such a success that they have been kept up regularly. The home team has improved so steady that they have always held their own against all comers, and the interest of the annual shoot has given an impetus to the interest in the club that has carried it through the year. The club was never in better condition than at present, and the skill of its crack team won the respect of all with whom it has come in contact.'

MAINE.—Topsham, June 9.—The third match for the Ligowsky medal between the Riversides and Bethels, was shot on Tuesday, June 3, at the Fair Grounds in Topsham, resulting in favor of the Riversides, the following scores being made, under the conditions governing the medal, Bethels challenging:

Bethels.		
Wormwell	1111011010	10 11 01 10 11—14
Young	2111001111	11 00 11 01 00—11½
Clark	1011110110	01 11 10 01 10—13

D. S. J.

WELLINGTON, Mass., June 7.—The sultry air of the city and the incitement of the medal match tended to augment the number of shootists at the Malden Gun Club at the Wellington range to-day. The various events resulted as follows:

First event, badge match—Buffum, Nicholas and Sanborn, fifteen each, taking first, second and third respectively.

Second event, five birds—Brown first, Lewis second, Hopkins third.

Third event, five birds—Dickey first, Scott and Snow divided second, Brown and Nichols divided third.

Fourth event, seven birds—Hopkins first, Adams second, Pratt and Nichols divided third, Warren fourth.

Fifth event, five balls—Dickey first, Saunders and Brown divided second, Hopkins third, Nichols fourth.

Sixth event, five birds—Dickey first, Short second, Hopkins and Warren divided third, Nichols fourth.

Seventh event, three pairs birds—Hopkins and Saunders divided first, Brown and Scott divided second, Nichols third, Pratt and Snow divided fourth.

Eight event, five balls—Dickey and Hopkins divided first, Warren and Shattuck divided second, Pratt and Lewis divided third, Scott and Short divided fourth.

Ninth event, seven birds—Dickey first. Scott and Snow second, Hopkins third, Warren and Lewis divided fourth.

Tenth event, five birds - Snow first, Short and Brown divided second, Shattuck, Hopkins and Warren divided third.

Eleventh event, five birds—Dickey and Snow divided first, Adams second.

BOSTON, June 4.—To-day was shotgun day at Walnut Hill, and notwithstanding the—for this season—unusually warm weather, the attendance was fair, and the day was much enjoyed by the admirers of the sport. All day long, with the exception of about half an hour at noonday, was spent discussing the merits of festive and nutritious baked beans and ample accompaniments provided by caterer Kendall, a vigorous and well-executed attack was kept up on the harmless, featherless birds, and many were the innocents that, by the well-directed shots of the "skillful" marksmen present, were brought to ground in a sadly disabled condition, never again so repeat their rapid and delusive flight. The interest in Wednesday's shoot was largely enhanced by the presence of several shots of celebrity from neighboring clubs. One pleasing feature of the Walnut Hill shotgun meets is the marked good fellowship that always exists among the frequenters of this popular and cheerful place of resort, for lovers of both the smooth and grooved barrels. Possibly the good nature and cheerfulness so abundant there, is largely owing to the influence exerted by the distinctive Boston diet, so freely and frequently indulged in by the patrons of the place. The "spring meeting" of the Rifle Association, which closed on Saturday the 31st ult., the details of which you doubtless have received long ere this, was in all respects successful. The attendance, although not as large as on some previous years, was fair, the financial results satisfactory, and the scores of the riflemen well up to the standard of former days. I think you are correct when you say, "You Boston people appear to keep up the rifle practice better than any other club."

The record to-day stood:

First event, five clay birds—De Rochmont and Evans divided first, Hart and Cutting divided second, Nichols, third.

Second event, five clay birds—De Rochmont first, Snow and Hart divided second, Nichols and Adams divided third.

Third event, five birds, five traps—De Rochmont and Hart divided first, Evans second, Nichols third.

Fourth event, five clay birds—Rowell first, Hart second, Snow and Cutting divided third, De Rochmont fourth.

Fifth event, five glass balls—Evans first, Snow and Rowell divided second, De Rochmont third.

Sixth event, five clay birds—Rowell and Snow divided first, De Rochmont second, Belcher third, Cutting fourth.

Seventh event, five glass balls—De Rochmont and Snow divided first, Evans and Nichols divided second, Adams third.

Eighth event, five birds, five traps—Nichols and Hart divided first, Adams and Russel divided second, DeRochmont and Stanton divided third, Evans fourth.

Ninth event, five glass balls—DeRochmont, Evans and Law divided first, Snow second, Belcher third.

Tenth event, three pairs birds—Evans and Hart divided first, Snow and Nichols divided second, DeRochmont and Russell divided third.

Eleventh event, five clay-birds—Hart and Snow divided first, DeRochmont and Cutting divided second, Nichols third, Evans and Law divided fourth.

Twelfth event, five glass balls—Law first, Snow and Rowell divided second, Evans third.

Thirteenth event, three pair birds—Law first, Snow second, Nichols and Howe divided third, Hart and Rowell divided fourth.

Fourteenth event, five clay-birds—Law and Hart divided first, Rowell second, Stanton third, Thompson fourth.

Fifteenth event, five clay birds—Law first, Adams and Rowell divided second, Stanton and Gooduow divided third, Nichols and Hart divided fourth.

Sixteenth event, three pair glass balls—Nichols first, Rowell and Evans divided second, Law third.

Seventeenth event, five clay birds—Snow and Stanton divided first, De Rochmont and Hart divided second, Evans third, Nichols and Rowell divided fourth.

Eighteenth event, five birds, five traps—Law first, Hart and Stanton divided second, Goodnow third, Nichols fourth.

Nineteenth event, five glass balls—Law first, De Rochmont and Snow divided second.

Twentieth event, five clay birds—Hart first, Law and Stanton divided second, Russell third.

SACRAMENTO, Cal., May 25.—The Pacific Sportsmen's Club held its monthly shoot at Agricultural Park to-day, at a lot of fast-flying birds, the following scores being made; first four at 20yds., rest at 21yds.: Routier 10, Graves 3, Nesbitt 7, Pedler 8, Bronner 7, Vaughan 8, King 8, Swanwell 6, Chapman 8, Davies 7. Routier won the first medal, and in the shoot-off of those killing 8 Pedler won the second medal.

The supply of live birds having been exhausted, there followed some clay-pigeon shooting, with the following result at twelve birds: Chapman 6, Kunz 7, Pedler 9, Tebbets 7, Hopper 6, King 10, Routier 9, Nesbitt 7, Davies 6, Flohr 8, Morell 4.

Another match followed, as follows, also at twelve birds: Tebbets 5, Chapman 7, Flohr 6, Pedler 6, Kunz 8, Ring 7, Routier 5, Bronner 6, Davies 6, Nesbitt 7.

EXETER, N. H., June 12.—The Exeter Sportsmen's Club will give a tournament on their grounds to-day that promises all who attend a grand, good time. The programme is: Sweepstakes at singles, entrance $1; sweepstakes at doubles, entrance $1; team match, three men, entrance $5. All at clay-pigeons, from five traps, constantly filled and changed. Sweepstakes at doubles, entrance $1, at clay-pigeons, from two fixed traps; sweepstakes at glass balls, entrance 50 cents, from single and double traps continuously throughout the day. Ties will be shot off under the same conditions as the matches in which they occur. Ties of two divide, except by consent. Class shooting, 50, 30 and 20 per cent. No postponement.

WINCHENDON, Mass., June 5.—The Winchendon Gun Club have voted to purchase a Holden glass ball trap. At the regular meet yesterday, clay pigeons, score was as follows:

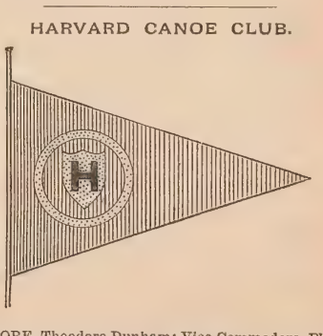
L F Martin	1111111101—9	P S Davis	1110010101—6
F F Hopgood	1111110110—8	G S Loud	1110101000—5
James Sutherland	1101110111—8	F E Mann	0010011101—5

MENOMONEE, Wis., June 6.—The following is a score of a practice shoot of a few members of the Menomonee Gun Club. The low score is owing to the fact that a perfect gale of wind was blowing at the time, making it almost impossible for the shooters to stand up at the score, to say nothing of doing good execution.

First shoot, fifteen clay-pigeons each, 15yds. rise, fourth notch, use of one barrel: Wm. Wilson 13, E. F. True 13, R. J. Flint 10, L. J. Seamans 10, G. R. Brewer 10, S. J. Bailey 10, J. R. Matthews 9, G. H. Seely 8, L. J. Hausen 5.

Second shoot, 10 glass balls, 18yds. rise, rotary trap, use of one barrel: L. J. Seamans 8, Wm. Wilson 7, E. F. True 7, G. R. Brewer 6, R. J. Flint 5, S. J. Bailey 5, G. H. Seely 3, J. R. Matthews 3, L. J. Hausen 3.

Canoeing.



CANOEISTS *are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.*

Secretaries of canoe clubs are requested to send to FOREST AND STREAM their addresses, with name, membership, signals, etc., of their clubs, and also notices in advance of meetings and races, and reports of the same. Canoeists and all interested in canoeing are requested to forward to FOREST AND STREAM their addresses, with logs of cruises, maps, and information concerning their local waters, drawings or descriptions of boats and fittings, and all items relating to the sport.

FIXTURES.

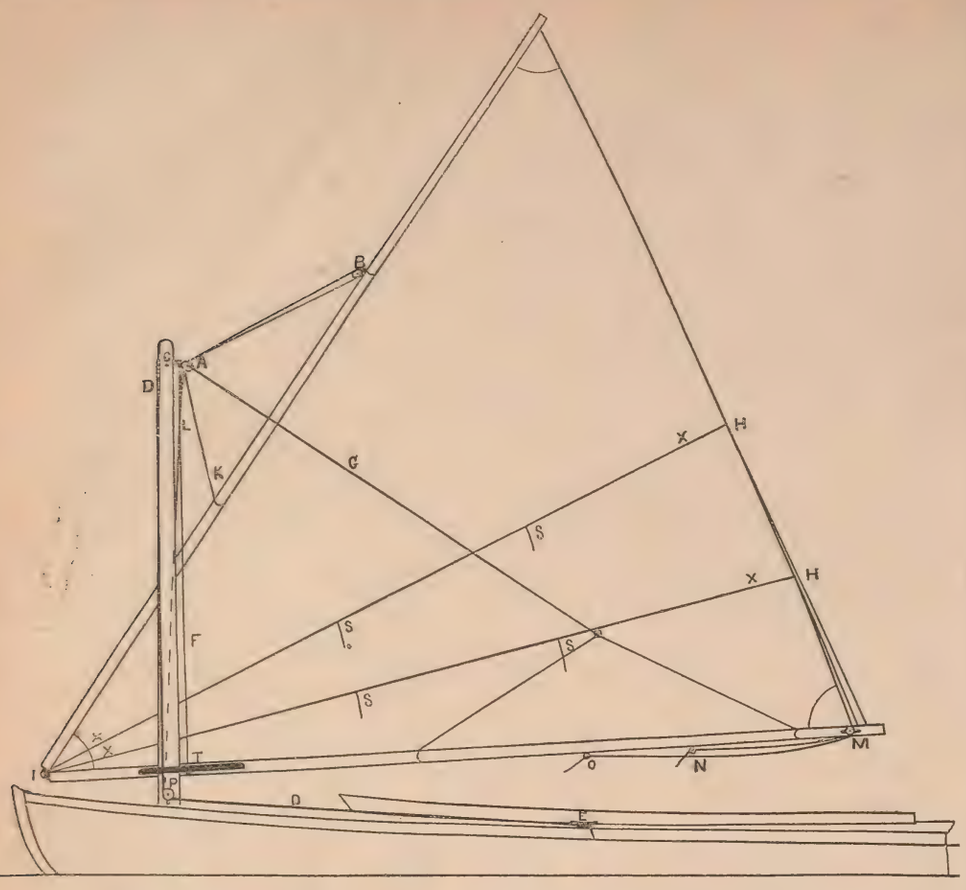
June 14.—Knickerbocker C. C., Spring Races, 152d St., N. R.
June 14 to 16.—Merrimack River Meet.
June 19.—Rochester C. C., Summer Regatta, Irondequoit Bay.
June 21.—New York C. C., Spring Races, Staten Island.
July 9 to 15.—Chicago C. C., Annual Cruise.
July 14.—Allegheny C. C., Cruise at Conneaut Lake.
July 19.—Chicago C. C., First Annual Regatta.
July 24 to 26.—Lake George Meet, Lorna Island.
Aug. 1 to 15.—A. C. A. Meet, Grindstone Island.

HARVARD CANOE CLUB.

COMMODORE, Theodore Dunham; Vice-Commodore, Philip L. Livingston; Secretary and Treasurer, Arthur G. Webster. Organized April, 1884. Burgee 10×15, crimson ground, gold ring and shield, black letter H.

A NEW BOATING CLUB.

Editor Forest and Stream:



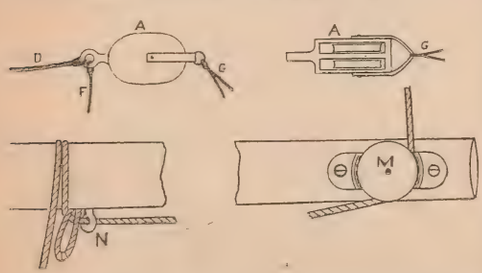
After writing many articles on the subject and talking of its advantages, a boat club has come into existence in Nashville. The practical pioneer of the movement was Capt. Fred Wright, an Englishman by birth but for many years a prominent cotton buyer in this city. True to his national fondness for outdoor sports, he was not long in the city before he had possessed himself of a new boat and enjoyed the healthful exercise of a row on the beautiful Cumberland. The temptation to follow suit was strong enough to induce others to order boats, until the number reached a sufficiency to organize a club.

The name has not yet been decided upon, though with such names as those of T. R. Thurman (president), James Bowron, H. B. Buckner, Jr., L. R. Campbell, J. D. B. De Bow, A. J. Dyas, Van Dronillard, Norman Reikman, Percy Kinnard and at least twenty more of the most reliable young gentlemen of the city, the club's future is an assured success.

As yet the class of boats and canoes owned by the members are of a composite kind, and not for racing purposes, though it is the intention of the members to secure at once shells for two, four and six oars, build boat houses, and at once establish a first-class club.

During the summer months the waters of the Cumberland are as clear as those of a spring branch, the current is almost imperceptible, and the scenery through which it flows is equal to that of a diminutive Switzerland. I cannot imagine a stream better suited to canoe excursions than it is. It abounds in game fish, and all along its wooded banks, deer, rabbits, hares and doves can still be found in abundance. I sincerely hope the club will prove a success, and know of no better source for its members to gain aquatic lore than by studying the yachting and canoeing columns of the FOREST AND STREAM. J. D. H.

NASHVILLE, Tenn.



AN IMPROVED LATEEN SAIL.

Editor Forest and Stream:

I have been reading your articles on amateur canoe building in FOREST AND STREAM with considerable interest and a great deal of pleasure. I have been patiently waiting for the article on sails, to see what would be offered. For the past three years I have been experimenting with the different styles of sails, endeavoring to find which sail was best adapted to amateur canoe sailing, and find the lateen by far the best, for the reason that it gives the most power with the center of effort nearer the deck, but it was an ugly customer to arrange so as to reef. I send you herewith a diagram of a reefing lateen sail that I used on Lake Chautauqua last summer, and was very much pleased with it; indeed, it was a success. It can be reefed so quickly that in a sailing regatta I reefed while coming in stays.

The mast is about double the height of mast for ordinary lateen, and has sheave fitted at C to work fore and aft. Pennant D is spliced into the swivel eye of block, A, and in setting the sail is rove through mast over sheave at C to block on deck at P (port side, near mast), and thence to cleat, E. There is also spliced to the eye of block, A, the boom lift, F, which is put through the jaw, T, and knotted on underside at such length as you desire to have the boom from the deck. A metal strap is also fitted to block, A, as shown, into which topping lifts, G, are spliced. When the block, A, is drawn snug up to the mast at C the sail is resting in the lifts and the boom is in proper position for sailing.

To hoist and lower sail, halliard L is used, being made fast on gaff

at K, passed up through double block A to single block B, back down through block A and through a block on deck on starboard side of mast opposite block P to cleat on starboard side of deck opposite E, and when thus rove need not be unrove further than the block in the deck, as in taking down the sail, drawing pennant D through its bearings clears the whole business, and all the gear can be rolled up in the sail and put away. In a sudden squall, by letting go pennant D the sail will immediately go overboard.

To set sail, place mast, reeve pennant D through sheave C, block P to cleat E; halliard L through block in deck to cleat; haul pennant D taut and belay; haul halliard L taut and belay and the sail is up. To lower sail, let go halliard L and sail will drop.

For reefing purposes, I splice into the eye at I a bolt rope, X, and sew to sail, as shown to H, where I fasten well, then extend through block at M to screw eye N and O on under side of boom (one block, M, on each side of boom for single and double reef), where a knot is tied.

To Reef.—Slack halliard L, draw taut reef pennant and belay by grasping boom and reef pennant back to screw eye with one hand and holding pennant while a loop is passed between main part and screw eye with the other hand as shown, then set up halliard L till sail is in position.

To Shake Out Reef.—Take hold of end of reef pennant and pull out loop and tauten halliard L. In reefing it is not necessary to tie reef points, S, as the setting up of bolt rope, X, virtually makes a new foot to the sail. The points need only be tied for looks. I think it an excellent cruising sail as well as for beginners.

By carrying reef pennant well forward on boom a reef may be taken when before the wind, but I have not found a time when I wished to reef when before the wind. When it blows so hard as to make a reef necessary sailing before the wind in a canoe, I think the best way is to take in sail.

LONG SHANKS.

CLEVELAND, Ohio, May 16.

THE NEWBURGH MEET.

ALL who visited Newburgh from New York have returned, but are still talking of the good time they had. We copy the following from the New York *Times*. There is no doubt that the local meets will, in the future, be an important feature in the growth of canoeing, as they bring in many who would not visit the annual meet, and excite an interest in the sport over the entire locality where they are held:

"The canoe meet held last week at Newburgh was a very successful affair. It was the first of a series of so-called local meets which are to take place in various parts of the country this summer. There can be no doubt that the American Canoe Association has done and is doing a good work. Including as it does members in every State of the Union and in Canada, it has had much to do in bringing about the 'canoe boom' that has made such marvelous progress during the last year. At the same time it is evident that the members of the association are too widely scattered to make it possible that any large proportion of them can attend the annual meet. Hence it seems very advisable that the canoeists who reside within practicable distance of one another should have their annual local meets. There would be little difficulty, for example, in bringing together a large number of New York and New England men at some central point, and in like manner, the canoeists of the Middle States, of Canada, and of the Northwest might form local subdivisions of the association. It would be a great pity if the American Canoe Association should be disbanded, or if it should cease to hold its annual camp, but the association can be made all the stronger by the help of local branches, each with its own special annual gathering."

ROYAL C. C.

THE second race for first-class sailing canoes was held at Hendon on Saturday, the 17th inst., when, out of five boats entered, the following four started: Violet, Mr. W. Whitney; Gladys, Mr. T. F. Knowles; Imogen, Mr. H. Church; Merlin, Mr. E. G. Wilkinson. A fresh breeze from the southwest enabled the boats to make a fast race of it, in spite of double reefs, for nearly the whole time. Gladys rounded the lower buoy first, closely followed by Violet who, passing her on the run home, continued to increase her lead during the remaining two rounds, eventually taking first prize. The times were taken as under:

	First Round.	Second Round.	Third Round.
Violet	4 05 00	4 40 00	5 16 00
Gladys	4 05 02	4 41 00	5 18 30
Imogen	4 07 00	4 44 00	5 25 00
Merlin	4 11 00	4 52 00	

The third match of the season came off at Hendon on Saturday last, May 24, but only the two following canoes came to the line: Gladys, Mr. T. F. Knowles; Imogen, Mr. H. Church. There was a fresh breeze from east at the start, when Imogen got off with a good lead, which she maintained until reaching the end of the lake. As soon as it came to a turn to windward, however, Gladys overhauled her hand over fist, and soon took the lead from her, eventually winning easily at 4:37. The race for the challenge cup will take place at Hendon today, when some good racing may be expected, Mr. D. Ashton having built a new canoe, and Messrs. W. Baden-Powell and A. H. Tredwen being among the entries.

THE GALLEY FIRE.

RICE, CORNSTARCH AND CEREALS.

FEW things are better or more easily prepared in camp than rice. Put some to soak at night and in the morning it will cook in a short time. Pour off the water in which it has soaked, and add again sufficient water to cook it, so as not to have the second watering. Cook slowly and do not stir. Always cook in cold water. (Hominy and meal are always stirred into boiling water).

Plain rice and milk with sugar, rice with a dressing of butter, sugar and nutmeg, rice with whisky sauce, rice any way is ever agreeable. For whisky sauce, blend together a little corn starch, water, butter and sugar, let come to a boil over the fire. Search the "medicine chest" until the proper label is found, and add a few spoonsful to the taste. Or a good dressing is made thus: One tablespoonful corn starch or flour stirred into half pint of water and let come to boil, sweeten with sugar and flour, with nutmeg or vanilla. A small bottle of vanilla occupies little space, and is found very useful by the cook.

There is nothing better among the unnecessaries of the commissariat than cornstarch; once taken it always assumes its place in the list of supplies. It is good for dressings, custards, omelettes, or simply boiled in milk. Its preparation is most simple, it is wholesome, nutritious, not bulky, and one package will supply any ordinary cruise.

Let one pint milk come to a boil. While heating mix two tablespoonsful cornstarch and one egg, one tablespoonful sugar, pinch salt, and a little cold milk. When milk boils add mixture; let boil a few minutes, stirring the while; be careful not to burn. Flavor with vanilla or lemon. Cornstarch custard is made the same way, only substitute three-quarters for two tablespoonsful cornstarch. If larger quantity is needed use same proportions.

If in a permanent camp, with the expectation of company to dinner, you may surprise them with the regular old-fashioned custard for dessert. Beat up four eggs, three tablespoonsful sugar and pinch of salt. Let one quart milk come to a boil. Stir mixture into boiling milk and set pail containing all into kettle or other pail of boiling water and boil until thickened; or set cups containing mixture into frying pan of boiling water.

A person with a little ingenuity can always have sufficient variety of food; the various vegetables, cereals, berries, melons and fruits. Too much meat is eaten in warm weather for the general good, and no doubt the canoeist is benefited by his departure from the carnivorous precincts of the city.

With the exception of a vial of "Jersey Blue" in the medicine locker and the ardent spirits which naturally belong to every canoeist, I would advocate (like the "Kingfisher" and others) the use of nothing stronger than tea, coffee or spring water; though the lover of the sparkling beverage may contend with the "tar," that "If wine's a poison so is tea, though in another shape. What matter whether one is killed by canister or grape?"

Aurora's coffee is of the right kind, simple, practicable and good. How many receipts we see, about as intricate as the manufacture of French pastry. A greenhorn on the perusal of them would prefer spring water to the undertaking. The only suggestion I would make to Aurora is the use of a small piece of codfish skin for the purpose of clearing. A good cup of tea is made by simply pouring boiling water on tea, two tablespoonsful to a quart of boiling water, replace on fire, let boil and set back to steep. This may not suit the epicure who makes his tea with a thermometer, but a hungry canoeist could never discriminate.

Now why can we not have a cook book of our own, each giving some ideas and receipts until we make quite a volume. And let the brotherhood work hard and tax its ingenuity for a good bed and a good dinner, for what is any cruise without either. Q.

TORONTO C. C. SAILING RACE.—As announced on the 24th ult., the Toronto C. C. were on that day to race for a challenge cup and three prizes. The fire in the *Mail* building, however, prevented the commodore from being present, so the race was postponed until last Saturday, when it came off. The course was from the foot of Lorne street to yacht Alarm, moored near the R.C.Y.C. wharf at the Island and return, to be gone over twice. Entries as follows: Boreas, Commodore Neilson; Isabel, Mr. Tyson; Sadie N., Mr. Nicholson; Whimbrel, Mr. Mason; No Name, Mr. Kerr; Racine, Vice Commodore Stinson. The Isabel, Boreas and Whimbrel carried heavy iron centerboards, the Sadie N. a wooden board, the No Name an Atwood folding board, and the Racine an iron keel. Wind was from the east, a fresh breeze, making a rough sea for such small craft. The start was made at 3:10 P. M., the Sadie N. immediately crossing the line with a good lead, followed in turn by the No Name, Isabel, Racine, Whimbrel and Boreas. The No Name soon took the lead, and little change in position took place until the Alarm was reached, when the Boreas—which had been sailed a better course than the others—made a good turn, and taking the lead was never headed, winning by about a hundred yards from the Isabel and two hundred from the Sadie N., the Whimbrel making a good fourth; the No Name and the Racine having given up the contest. The No Name—a new craft by Glendinning—would probably have captured the cup if her rudder lines had not given way. She showed great speed and weatherly qualities. The Atwood centerboard, with which she is fitted, did its work well, and is no doubt a great help to any small craft in going to windward. They are being put into a great many skiffs, and now that they are manufactured in Canada by the Wildermuth Spring Bed Co., of Gananoque, the cost will be much less than when imported. The Commodore, in addition to winning the cup, also won a board of the above description, value $6, presented by the above company. Mr. Tyson won a spirit stove presented by W. A. Sparrow & Co., and Mr. Nicholson a camp knife presented by Mr. McDowall, 174 King street east. Next Saturday the club will have a race round the Island for the sailing cup held by Mr. Tyson, and the following Saturday may see another race for the running cup.—*Toronto Mail.*

KNICKERBOCKER C. C.—The annual regatta of the Knickerbocker C. C. will take place on Saturday next, June 14, at 3 P. M., off the club house, One Hundred and Fifty-second street, North River. The races, which are open to club members only, will be sailed under A. C. A. rules, they are: Paddling classes 2 and 4, 1 mile; sailing classes, A and B, 3 miles; paddling and sailing, all classes, 1 mile; tandem race, open to all, 1 mile. First and second prizes will be given in all except the tandem, in which but one prize will be given. Mr. C. G. Y. King is clerk of the course.

NEW YORK C. C.—The regular spring regatta will be held June 21, off the club house at New Brighton. Races called on arrival of 2 P. M. boat. There will be a sailing race for classes A and B, distance 3 miles; paddling races for classes 2 and 3, distance 1 mile; a tandem paddling race same distance, an upset race and canoe gymnastics. The regatta is open to all amateurs and suitable prizes will be offered. Written entries must be sent to Regatta Committee, care of J. F. Newman, secretary, 19 John street.

CANVAS BOATS.—Grand Rapids, Mich.—Will you please allow me to make a suggestion to your correspondent "Young Tenderfoot" of Philadelphia. It is simply this: If you buy a folding canvas boat, do not get one that has a seam through the center. I have tried two fifty-dollar ones. The first one gave out after using three times, the other leaked badly the second time it was used and had to be sewed all over. Should you decide to get a canvas boat, have it made from one piece of cloth.—ARTHUR WOOD.

THE A. C. A. MEET.—Dr. Neidé writes that by an arrangement with the publishers he is able to supply maps of the Thousand Islands to members of the American Canoe Association at cost, forty cents each. The map is on a scale of one and a half inches to the mile, and includes the river from above Gananoque to Grenadier's Island. It is neatly bound in pocket book form. Copies can only be obtained at this price by A. C. A. members and from Dr. Neidé.

CANOE PHOTOS.—We have received two photos of the Newburgh meet from Mr. Joslin of Newburgh, one 12×14in., a fine view of Plum Point from the south, with canoes on the river, the other, an 8×10, showing both sides of the river toward Cornwall and the canoes turning the lower stakeboat in Class A sailing race. Canoeists can obtain copies of these and the other three views from Mr. Joslin, No. 73 Water street, Newburgh, N. Y.

MERRIMAC RIVER MEET.—A large attendance of canoeists is promised at the meet on the Merrimac River below Lowell, on June 14, 15 and 16. John Boyle O'Reilly and other Boston canoeists will be present, and the canoe fever is rapidly spreading among local canoeists.

BARK CANOES.—A correspondent inquires whether any other bark but birch is suitable for canoes. Can any of our readers inform us?

Yachting.

FIXTURES.

Secretaries of yacht clubs will please send early notice of proposed matches and meetings.

STEEL FOR SHIPBUILDING.

ALTHOUGH the use of steel for shipbuilding is a novelty in this country, the subject is one of the greatest interest to American yachtsmen and shipowners. Although steel vessels were built in England over twenty years ago, in 1865, six steamers, 5,312 tons in all being launched, its use was discontinued on account of the expense, but within the past five years its decreased cost, together with its many advantages over iron, have brought it into much more general use abroad, the cost now being about the same as iron, while its strength is much greater.

The steel used in the new government cruisers now building is made at the works in Chester, Pa., the plant for which was designed and erected by Mr. C. M. Rider, in 1881, and is capable of turning out coatings up to 40 tons weight. The arrangements are most complete in

all details, the ingots cast being sufficiently perfect to admit of rolling at once, without any cleaning or chipping.

At the outset of the undertaking much doubt was expressed by experts as to the quality of the metal to be made, it being estimated that at least 25 per cent. would be rejected, the specifications requiring a tensile strength of 60,000 pounds per square inch, and not less than 23 per cent. elongation in 8in. Out of 38 consecutive heats made, however, one only failed to meet the above specifications.

An entirely new method of manufacturing steel plates has lately been brought forward by the inventor, Mr. Joseph Whitely, of Leeds, England, who is now experimenting with the process.

A hollow iron cylinder lined with fire brick is mounted on a horizontal axis on which it revolves. A pipe perforated with holes conducts the molten steel to the inside of the cylinder, on which it falls, and is distributed in an even thickness by centrifugal force. When sufficiently thick this inner cylinder is drawn out, slit on a circular saw, flattened and rolled to the required thickness.

If a plate is required for shipbuilding, a mold would be used, for instance, 5ft. diameter and 5ft. long, in which a cylinder 1in. thick is cast, making, when cut and flattened, a plate 5ft.x15x1in. thick, which by successive rollings is reduced to ¼in. thick, growing to 30ft. lengths, the breadth being about the same. A mold has been used 9ft. long and 5ft. diameter, containing a plate of 30cwt. It is claimed for these plates that there is no risk of overheating or burning, the metal is homogeneous and of much greater strength. The process is also applicable to the manufacture of boiler tubes.

LARCHMONT Y. C.

ALTHOUGH all the boats enrolled in the club are considered as being entered for the pennant matches of each spring and fall, but thirteen appeared at the starting line on Saturday, June 7, for the first match of the season. Besides the attractions of the races, the occasion was, in a way, a housewarming in honor of the club's new and enlarged quarters, and a number of visitors, besides the club members were present.

In addition to the pennants, special prizes were offered by Commodore Monroe, of $50 to the winning yacht in any class having four or more starters, but this inducement failed to secure full entries, as but one class, the smaller open boats, mustered over three starters, while but one other class had more than two, as given below:

SECOND-CLASS CABIN SLOOPS.

Name.	Owner.	Length.
Athlon	Dr. J. C. Barron	54.8½
Eclipse	E. H. Wales	51.0

THIRD-CLASS CABIN SLOOPS.

Dream	Gibbs & Babcock	41.6
Schemer	Com. Monroe	37.3

FOURTH-CLASS CABIN YACHTS.

Aneto	H. W. Eaton	22.0
Gannet	Oliver Adams	21.2
Varuna	E. S. Turton	— —

OPEN BOATS 24 TO 27 FEET.

Cheemaun	W. I. Van Wort	24.10

OPEN BOATS 20 TO 24 FEET.

Willis	C. E. Jenkins	22.10
Zoe	H. Sanderson	22.9
Fairy	F. E. Towle	21.9
Cruiser	A. B. Alley	20.10
Nymph	F. W. Flint	21.11

The Vivien was also entered in the fourth class, but did not start.

The weather, which was all that the visitors and spectators could desire, did not promise as well for the yachtsmen, though at 11 o'clock, when the judges, Messrs. W. H. Jenkins, R. B. Rathbone and W. C. Stewart, started out in a little steam launch, there was a light breeze from the southwest, the tide being half flood.

The course for the first three classes was from Pagoda Point around the buoy west of Execution Light, thence around Matinicock Buoy and home past Captain's Island, where a markboat was moored, past Execution Light, and finishing at the starting point, a distance of 22 miles; while the two classes of open boats, after leaving Matinicock Buoy, returned by the way of the black buoy off Constable's Point, and Execution Light, making 17 miles.

At 11:14 the first gun was fired, the signal to start following at 11:19 and the final gun at 11:24, at which time all but Dream and Schemer were away, these being handicapped to the extent of 2m. 20s. each. The order and times of starting were:

Fairy	11 22 33	Cheemaun	11 25 20
Aneto	11 22 34	Eclipse	11 25 31
Gannet	11 22 48	Willis	11 25 33
Cruiser	11 22 54	Athlon	11 25 58
Zoe	11 23 55	Dream	11 26 20
Nymph	11 24 00	Schemer	11 26 20
Varuna	11 25 05		

On the beat out to Execution Light, Fairy held the lead for some distance, with Cruiser, Zoe, Eclipse and Athlon in the order named, until when near the buoy, Cruiser went to windward of her, holding her place, however, but for a few minutes, as big Eclipse soon passed her, rounding first at 12:17:00, the others following with Cruiser at 12:17:40, Zoe 12:18:18, Athlon 12:18:40, Fairy 12:19.02, Cheemaun 12:19:40.

By this time the wind had fallen so that the other boats dropped out except the Varuna, but after a time it breezed up again, and all were off for Matinicock buoy, Athlon being first to set her spinnaker, followed by Eclipse, while the little fellows had to content themselves with jibs boomed out. Eclipse was first around at 1:24:20, Athlon 20 seconds later, and Cheemaun, sailing alone, as there was no competitor in her class, followed at 1:28:20. Cruiser still led the small ones at 1:30:32, with Zoe at 1:31:00 and Fairy in the rear at 1:31:40.

Here they parted company with the big ones, making for Constable's Point buoy, and rounding as follows: Cheemaun 2:25:20, Zoe 2:29:00, Fairy 2:29:40, Cruiser 2:31:30.

Meanwhile Athlon was doing her best down the wind with Eclipse, and after the most exciting part of the day's sport, succeeded in rounding the snake boat off Captain's Island, half a minute ahead of Eclipse, at 1:56:19. The beat to Execution was a very pretty sight, the advantage to windward apparently being with Athlon, but finally she broke tacks and stood well into Glen Cove, under the land, the Eclipse passing Execution Light 1m. 40s. ahead.

The little fellows meanwhile had made a good fight of it, Cheemaun rounding the buoy at Execution Light at 3:13:45, Fairy 3:18:56, and Zoe 3:19:50. The run home was made with jibs to port on the open boats and spinakers on the same side on the two sloops, Cheemaun being first over the line, the times of the boats being:

SECOND CLASS—CABIN YACHTS.

	Start.	Finish.	Elapsed.	Corrected.
Athlon	11 25 58	3 57 33	4 31 35	4 31 35
Eclipse	11 25 31	3 57 20	4 31 49	4 29 04

FOURTH CLASS—CABIN YACHTS.

Varuna	11 25 05	4 09 53	4 44 48	4 42 44

OPEN SLOOPS—24 TO 27 FEET.

Cheemaun	11 25 20	3 36 44	4 18 24	4 11 24

OPEN SLOOPS—20 TO 24 FEET.

Fairy	11 22 33	3 52 53	4 30 20	4 28 24
Cruiser	11 22 54	3 57 08	4 34 14	4 30 23
Zoe	11 23 55	3 53 20	4 29 25	4 29 10½

The next races of the club will be the annual matches on July 4, while another pennant match will take place in September.

EASTERN Y. C. ANNUAL MATCHES.

THE Eastern Y. C. will sail their annual matches off Marblehead Rock on Friday, June 27, at 11:30 A. M., or if stormy on the following day.

All yachts must be entered by 2 P. M. on Thursday, June 26, at the office of Edward Burgess, Secretary of the Club, No. 7 Exchange place, Boston.

The following prizes are offered: First class schooners, $250 and $200; second class schooners, $150 and $75; third class schooners, $50; first class sloops, cutters and yawls, $150 and $75; second class sloops, cutters and yawls, $75 and $35. The awarding of prizes will be under Rule 8 of sailing regulations.

The first and second class schooners, and first class sloops, cutters and yawls will make the first race and will sail one course, but they will start respectively as below stated. The third class schooners and second class sloops, cutters and yawls will make the second race and will sail one course. All starts will be flying. The first race will be open, under this circular, to all yachts of any regularly organized yacht club.

STARTING SIGNALS.

At 11 o'clock, or thirty minutes before starting, flags, bearing the numbers of the courses to be sailed, will be hoisted on the regatta committee steamer; the course for the first race above that for the second race. If only one flag is shown all will sail the same course.

At 11:25.—Warning signal five minutes before the start by lowering numbered flags, hoisting blue flag and blowing a whistle.

At 11:30.—Start of first class schooners by lowering blue flag and blowing a long whistle. Five minutes' limit for this class to start. This signal will be the warning for the second class schooners.

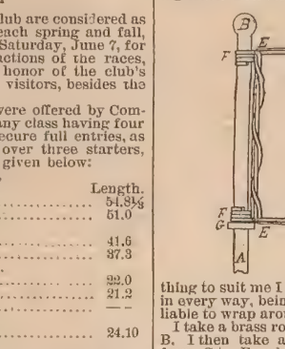
At 11:35.—Start of second class schooners and limit for first class schooners by lowering blue flag (which has been hoisted one minute previously) and blowing whistle. Five minutes' limit for this class to start.

At 11:40.—A short whistle marks the limit for second class schooners.

At 11:45.—Start of first class sloops, cutters and yawls, which start signal, and no limit allowed. Their time will be taken from the whistle and the lowering of the blue flag (which has been hoisted one minute previously).

At 11:50.—Start of third class schooners and second class sloops, cutters and yawls, which start at signal, and no limit allowed. Their time will be taken from the whistle and the lowering of blue flag (which has been hoisted one minute previously).

In case of delay in the first signal the same intervals of time will be observed. Every yacht sailing the race must carry her private signal at the mainpeak. Only sails allowed by Rule 11, of sailing regulations, may be carried. Any yacht having cause for complaint must signify it in accordance with protest rule of sailing regulations. The starting line will be from Marblehead Rock to a stake boat.



A steamer will be provided for members and their families, leaving Rowe's wharf, Boston, at 9:45 A. M., and calling at Phillips's wharf, Salem, leaving there at 11 A. M. sharp, landing at the same points in the evening.

The annual cruise of the E. Y. C. will begin on July 24, starting from the rendezvous at Marblehead and going around Cape Cod to the westward.

A TELL-TALE.

Editor Forest and Stream:

In reading your paper I often see suggestions and inventions which are given in your paper for the edification of those who are interested in the particular lines to which such things refer. You will remember some time ago I sent you an inquiry for "tell-tales," as we call them here, or a flag to indicate the direction of the wind, to be used on sailing craft. You very kindly answered this inquiry, but not finding any-

thing to suit me I have devised the following which I consider good in every way, being ornamental and sensitive to the wind, and not liable to wrap around the rod.

I take a brass rod, A, and put on it a washer, G, and a movable cap, B. I then take a piece of brass wire and bend it from C to D then from C to E and D to E and twist the two together from E to E; I then wind each end around the rod A, so as to form bearings. It is now ready for the bunting which is put over the frame C E D E, so that the frame is entirely inclosed by the bunting, which is sewed in a small seam at S S, also sewed together at the top and bottom. This makes the best tell-tale I know of, for it is a vane and flag combined—for the same height of rod can be longer flag, as the frame prevents its hanging down low. J. P. O.

NEWARK BAY Y. C.

THE complete times of the races of this club on Decoration Day are as follows, all being sailed over the club course in Newark Bay, a distance of twelve miles. There were twelve entries in four classes, cabin sloops, jib and mainsail, cats over 19ft. and cats under 19ft., for challenge pennants for each class, to be won three times before becoming the property of the winner. The wind was puffy and very uncertain, and the races were won more by luck than good sailing.

CLASS A.

	Start.	Finish.	Actual.	Corrected.
Gray Eagle	12 02 00	1 53 55	1 51 55	1 51 55
Vixen	12 07 50	2 03 55	1 56 05	1 53 10
Emmy C	12 06 53	1 06 00	1 59 07	1 57 49

CLASS B.

Leo	11 59 52	2 20 00	2 20 08	2 20 08
Rambler	12 00 32	1 59 00	1 58 28	1 56 28
Linda	12 00 21			

CLASS C.

Cloud	11 57 33	2 01 00	2 32 07	2 03 02
Shadow	11 57 00	1 54 00	1 57 00	1 55 15
Triton	11 56 30	1 53 44	1 57 14	1 54 09
Ripple	11 58 09			

CLASS D.

Marion	11 57 15	2 33 28	2 36 18	2 36 18
Eddy	11 55 30	2 25 11	2 29 41	2 29 34

The club is bending every effort to make the open match of June 16 a success. There have been received to date about forty entries, including the most of the crack small boats of this vicinity, with the promise of many more. It is especially desired that cabin sloops from 25 to 35ft. long be well represented, and all owners of boats of this class may rest assured of having good treatment and of meeting foemen worthy of their steel. There will be six classes, with a cash prize of $20 for each class; $3 entry fee. This club was organized in September, 1882, with nineteen members, and now has eighty members and twenty yachts.

ATLANTIC Y. C.

THE first of the three principal matches that each spring excite the yachtsmen of New York, that of the Atlantic Y. C., sailed on Tuesday last, derived its interest mainly from the fact that some new boats were to be tried as well as several of the old ones which have been rebuilt or materially altered during the winter. The question of type, or of cutter vs. sloop hardly entered into races, the yachts, with one exception, being centerboard boats. The race may really be considered as the debut of Dr. Barron's new sloop Athlon, as the previous occasions on which she has appeared have hardly been fair tests of her merit, but after Tuesday he need not be ashamed of the Wave's successor. Another boat in the same class, whose performance was watched with some interest, was the Thistle, an old boat, but lately rebuilt and new in New York waters, and that has promised on the few occasions that they have met, to be a worthy antagonist of the Athlon. Grayling also has been changed considerably since her disastrous first season, her spars and ironwork having been greatly reduced. The boats in the smaller classes are already pretty well known, the new one being Mr. Wintringham's Nomad.

The weather early in the morning promised a repetition of last year's disappointment, with wind from the northeast and cloudy sky at 10 A. M., when the tug Luckenback, with the judges on board, left Brooklyn for Bay Ridge, the steamer Columbia, with the members and their friends, following shortly after. Off the Atlantic Basin the yachts, mostly under mainsail, jib and topsail only, were flying about waiting for the signal, while several steam yachts were taking guests on board to witness the race.

The classes were as follows: Class A, schooners, 72ft. and over; Class B, schooners, under 72ft.; Class C, cabin sloops, 55ft. and over; Class D, cabin sloops, 43ft. and under 55ft.; Class E, cabin sloops, 35ft. and under 43ft.; Class F, cabin sloops, 30ft. and under 35ft.; Class G, cabin sloops, 26ft. and under 30ft.; Class H, cabin sloops under 26ft.; Class I, open sloops; Class K, catboats.

At 10:36:10 in answer to a signal from the Luckenback, the first gun was fired from the bluff, the understanding being that the second gun was to go off three minutes later. Nearly all were well placed above the starting line, toward which an ebb tide was carrying them while the wind had shifted to S. W. with no increase of force. Three minutes passed, all bore down on the line, Clytie ahead, but no gun was fired. Clytie was obliged to cross, tack, and work back above the line, losing all the advantage she had. Finally three loud blasts from the tug awoke the artillerist on shore, and at 10:53:50 the second gun was fired, the Thistle crossing first at 10:55:35, Crusader second, Mischief third, running up jibtopsail as she did so, the times being:

Thistle	10 55 35	Enterprise	11 05 56
Crusader	10 58 00	Haze	11 06 20
Mischief	10 59 05	Daisy	11 06 50
Athlon	10 59 10	Amazon	11 07 12
Fanny	11 00 05	Fanita	11 07 18
Triton	11 00 40	Roamer	11 07 18
Grayling	11 01 50	Romeyn	11 07 25
Gracie	11 02 25	Venture	11 07 40
Agnes	11 02 35	Viking	11 09 20
Clytie	11 03 12	Linda	11 10 19
Leona	11 03 12	Nomad	11 12 10
Ilderan	11 03 16	Una	11 12 40
Crocodile	11 04 28	Stella	11 12 55
Phantom	11 04 40		

Just before the start an old gentleman pulled alongside the judge's boat in a light gig and asked for a list of entries, after scanning which he quietly pulled off toward the Narrows.

The course for A, B, C and D was from the anchorage off the club house, foot of Fifty-fifth street, South Brooklyn, down through the Narrows, to and around a stakeboat near buoy No. 8, off Sandy Hook, passing to the west of the same; thence to and around the Scotland lightship, keeping the same on the port hand; thence to and around Sandy Hook lightship, keeping it on the port hand, and thence home, going to the southward and westward of the beacon on Romer shoal.

For class E the same course, to and around stakeboat near buoy No. 8; thence to and around Scotland lightship, keeping it on the port hand, and thence home.

For classes F and G the same course, to and around stakeboat near buoy No. 8, keeping the same on the port hand, and thence home.

Classes H, I and K had no starters.

The following prizes were offered: A first prize to the winning yacht in each class, in which at least two yachts shall enter and start; a second prize in each class, in which at least four yachts shall enter and start; and a third prize in each class, in which at least seven yachts shall enter and start.

The "Livingston Memorial" prize to be awarded to the first sloop of Class D in at home stakeboat, without time allowance, to be held on the conditions of its presentation.

A noticeable feature of the arrangements was the size of the figures on the mainsails of the competing yachts, which were really large enough to be seen at a considerable distance, enabling the spectators to place the boats throughout the race.

The entries and allowances were as follows:

		M. S.
CLASS A—SCHOONERS.		
Grayling	L. A. Fish	Allows
Crusader	J. B. Maxwell	0 02
Clytie	A. P. Stokes	4 06
CLASS B—SCHOONERS.		
Haze	C. W. & J. Hogan	Allows
Triton	Harry E. Dodge	1 53
Agnes	H. H. Hogins	8 51
Leona	E. C. Sterling	19 41
CLASS C—CABIN SLOOPS.		
Gracie	Joseph P. Earle	Allows
Mischief	Joseph R. Busk	9 21
Fanny	H. Cruger Oakley	5 33
Athlon	J. C. Barron, M.D	17 16
Thistle	William Ziegler	17 16
CLASS D—CABIN SLOOPS.		
Roamer	J. W. Cooper	Allows
Enterprise	G. B. Moffat	4 10
Fanita	George J. Gould	4 13
Stella	J. L. Marcellus	7 29
Linda	H. C. Roome	8 21
CLASS E—CABIN SLOOPS.		
Crocodile	J. G. Prague	Allows
Una	Miles Wood	6 32
Phantom		
CLASS F—CABIN SLOOPS.		
Daisy	C. F. Ulrich	Allows
Viking	F. C. Swan	0 31
Nomad	H. C. Wintringham	0 56
Romeyn	W. R. Vermilye	1 02
Ilderan	Walter Southwick	5 09
CLASS G—CABIN SLOOPS.		
Venture	H. G. Peabody	Allows
Amazon	Franklin Beames	3 18

The Amelia was entered in Class E, but withdrew, Una taking her place.

Most of the yachts crossed on port tack, the remainder going about when well over, soon working short tacks through the Narrows with a light S. W. wind. At 11:40 Mischief was off Fort Tompkins, Fanny astern inshore and Gracie by the Seawanhaka Basin, where she had run in, losing wind and tide by so doing, the schooners working down the Long Island shore, and once outside Crocodile ran ahead to Coney Island Point. The order was Crocodile, Athlon, Fanita, Romeyn, Mischief and Thistle, with Gracie at the tail of the procession, the remaining boats being scattered between her and Thistle. Off Norton's Point, Fanita took the lead of Crocodile, who now gave second place to Mischief.

Here Fanita stood to the eastward, losing ground by so doing, while Mischief, followed by the others, stood for Buoy No. 8, on port tack, under a breeze that sent the water through her scuppers, and, for the short time it lasted, made the prettiest sport of the day. Down they came, showing half their sides to the watchers on the judges' boat. Mischief first around, and off on starboard tack, Fanny hurrying after, taking in jibtopsail as she came up, Fanita third, content with gafftopsail only, and Crocodile laying down under mainsail and jib, having found her topsail too much for her. Thistle and Athlon, the latter heeling well down, followed next, then the catamaran Jessie, not in the race, but traveling as though she was, while close together came Grayling and Triton, followed by Romeyn, the times being:

Mischief	1 15 30	Triton	1 26 08
Fanny	1 18 08	Romeyn	1 27 30
Fanita	1 19 18	Agnes	1 32 30
Crocodile	1 20 58	Enterprise	1 32 45
Thistle	1 21 28	Gracie	1 33 00
Athlon	1 22 05	Crusader	1 34 55
Grayling	1 25 50		

Short tacks followed, and then longer legs down the beach to Scotland Lightship, the tug running ahead, the Columbia in company with her.

While laying to awaiting the Mischief, a small boat pulled alongside the tug and the oarsman asked for a drink of water, and on receiving it lay on his oars a short time to see the first boats, then pulled off steadily toward the Sandy Hook lightship. He was at once recognized as the gentleman who had asked for the programme of the races at the starting point three hours before. His name is Whiting, an ex-commodore of the Brooklyn Y. C., who still finds pleasure on the water in rowing about. His boat was a light cedar, half outrigged gig about 16ft. long, everything about her in perfect order, painters flemished down, a watch compass and lamp fastened to a thwart within easy view. Late in the afternoon, when the tug was well in toward the Hook, with a fog astern and some sea, the little Ida was passed, making bravely for the Hook.

Approaching the lightship came Mischief on port tack, Fanita and Crocodile, the latter getting out spinnaker boom for a run home from this point, taking some time, however to get her spinnaker set. Jessie was also on hand in time to see Athlon lead Thistle around.

Mischief	2 09 17	Thistle	2 20 00
Fanita	2 11 10	Triton	2 23 10
Crocodile	2 14 20	Gracie	2 26 15
Athlon	2 17 40	Crusader	2 28 07
Grayling	2 19 42	Enterprise	2 34 0 0
Fanny	2 19 50	Roamer	2 34 50

No others were timed, the tug hurrying after the leading boats, now well to windward. Mischief and Fanita were now having a bout, the latter having set jibtopsail in the light wind. Mischief was first around the lightship at 3:04:04, coming up under the lee of the lightship, having lowered jibtopsail. As she passed, her spinnaker boom was swung into place from forward, but on the port side, so that it had to be shifted to starboard.

Fanita, at this time well below the lightship, now stood up, also dropping spinnaker boom to port, breaking out spinnaker at 3:08:30, and in order to avoid shifting it, keeping her main boom to starboard, to do which she had to keep down toward the beach, leaving Mischief on a straight course up toward the bay. Grayling now came up to show that there were schooners as well as sloops in the race, passing third, while Fanny took fourth place, with Athlon close on her weather beam and Thistle following, after which there was a long wait for the stragglers, led by Gracie, the Haze and Agnes, with several others having wandered off to the southward, and not coming up in time to be noted.

Mischief	3 04 04	Thistle	3 27 35
Fanita	3 06 55	Gracie	3 36 00
Grayling	3 07 40	Crusader	3 37 50
Fanny	3 18 00	Roamer	3 46 30
Athlon	3 18 10	Triton	3 47 20

The procession home was hidden in a haze that came up, but there was a fresh wind astern that hurried all up the bay. Among the rear guard were Triton and Roamer, the latter with spinnaker like a balloon pulling her along, and keeping very close to her larger rival.

In the Narrows at 4:30 the sun broke through the clouds, showing Mischief well ahead with Fanny, while astern were Athlon and Fanita, the latter doing all possible to hold a place with the big sloops. While both were at their best, Athlon carried away the tack of her jibtopsail, the sail running up the stay, but a hand climbed up the stay securing the sail and hauling it down, soon after which Athlon walked through Fanita's lee.

Gracie, meanwhile, was doing her best work of the day coming up and passing Athlon. Of the schooners the Grayling had outrun the fleet, being the first in, her performance throughout the entire day having proved the value of the improvements made in her. The times of finish and corrected times were:

	Start.	Finish.	Elapsed.	Corrected.
CLASS A—SCHOONERS.

Amazon	11 03 20	4 22 05	5 18 45	5 15 27

The only mishap was to the Una, who lost her topmast. The winning yachts were: Class A, Grayling; Class B, Triton; Class C, Mischief; Class D, Fanita; Class E, Crocodile; Class F, Romeyn; Class G, Amazon. Crocodile also takes the Livingston Memorial Prize, and Roamer second club prize in her class.

QUAKER CITY Y. C.

THE start at 10:50 A. M., on Monday, June 2, was one of the very best, notwithstanding the light and variable airs. As predicted by the writer the wind swung around from the N. E. to S. W. and the yachts, with their light sails set, speeded away. At Gloucester the Sunbeam having got her club topsail set had passed all the cabin boats, and much to the surprise of all was rapidly going through the fleet of open boats. Minerva No 2, or more familiarly speaking, the "Old Reliable," was following close in her wake. It was supposed by the quick move of the Rosita that she would soon go to the front in her class and capture the Minerva, as it was the Rosita's wind, but she had her match in the Consort, and that settled it.

After the regatta steamer came abreast of the fleet at Red Bank, it was discovered that the Pratt had gone down to show the rest of the fleet the way, the little J. Galligher keeping her company, with the Elwell a good third, Sunbeam fifth, Minerva, of Trenton, sixth. Esther seventh. Off Hog Island the Au Revoir went to the front, Pratt a good second, Elwell third, Richmond fourth, Pierson fifth, Sunbeam sixth, Minerva No. 2 seventh. Soon after Flick got his work in, and by a masterly manipulation of airs the Pratt took the lead, keeping it throughout the race.

FIRST CLASS CABIN BOATS.		Chester Buoy.	Home.
Sunbeam	2 10½		6 11¾
Minerva	2 20		6 21
SECOND CLASS CABIN BOATS.			
Minerva No. 2	2 13½		6 20¾
Consort	2 26½		6 25½
Rosita	2 24		6 27½
Florigar	2 26		6 30
THIRD CLASS CABIN BOATS.			
Thomas	2 28½		6 25¼
Nohma	2 46		6 33
Tillyer	2 23½		6 35
Ariel	2 38		6 36
FOURTH CLASS OPEN BOATS.			
Pratt	2 02		5 40¼
Pierson	2 11		5 46
Elwell	2 07		5 47
Esther	2 16		5 59¾
Minerva (Trenton)	2 13¾		6 18¼
Clee Bro's	2 20		6 28¼
FIFTH CLASS OPEN BOATS.			
Richmond	2 12		5 57¾
Au Revoir	2 08		6 01¾
Skelton	2 41½		6 30
J. Galligher	2 34		6 33½

Turning the lower buoy the flagship Florigar's topmast slipped away from the heel fid and turned down. The run home was void of excitement on account of the light wind. The Pratt stood over for Linicum Island, all hands following like sheep, until the Sunbeam rounded the buoy and went for the slack water under Jersey shore, Cap. Wyble caught eels years ago in the grasses along the Spanish main and knew just what he was about, of course he had many followers.

The Pierson, one of Jim Collins's last and best, having done phenomenal sailing in last year's regatta, was expected to take care of the Pratt, as she did last year. But the Elwell had something to say about that, and fought the Pierson every inch, making it quite exciting, especially at the Horseshoe; but shape, like blood, will tell, and she came in a good second. The Thomas got a puff or a luff, or something else hitherto unknown, and came in with her tail up, as will be seen by the record. Commodore Hanigan felt good when the Richmond showed up so far ahead of her class and fourth boat in the fleet.

The most remarkable feature of the whole race was the splendid performance of the Sunbeam in the light airs. Had it blown hard enough to have canted her a single degree, the judges would not have been able to take her time at the home flag boat. The grand old Minerva No. 2 again sweeps the deck, adding another to her many victories. R. G. W.

IREX.—The notice of the new steel cutter Irex is taken from *Land and Water:* "The new 85-ton racing cutter, built by Mr. Fay, at Northam, Southampton, for Mr. John Jameson, owner of the famous racer Samœna, is from the designs of Mr. Richardson, who also designed the Samœna, Silver Star, Marguerite, etc., and is of the steel-composite type—steel frames, with plankings of teak and pitch pine, the hull being of immense strength. It was originally hoped that she would be ready in time for the early matches, but strikes among the workmen on the Clyde at the beginning of the year created a delay in the supply of the steel, and for several weeks the work stopped at the casting of the lead keel, a ponderous monstrosity weighing close on 72 tons, this being the heaviest keel of the kind ever cast. It is in three or four sections, dove-tailed together, and secured by gun-metal bolts of enormous caliber; from this the Irex has been gradually built up, very much in the fashion that a house is raised on its foundations, and the rapidity with which she has been completed up to the period of launching has been really marvellous, hardly three months having elapsed since the receipt at the yard of the first of the steel castings. She has been turned out in a manner which does Mr. Fay and whole staff the greatest credit, under the vigilant eye of Capt. O'Neill, of Myosotis, Annasona and Samœna fame, who has literally surveyed every inch of stuff put into the ship, entering at the same time into a hearty spirit of co-operation with the builder that has done much to facilitate the progress of the work. We have already given the principal dimensions of the yacht, but may repeat that she is 85ft. long on the water-line, and 99ft. over all—her counter thus being of great length, with a sternpost of tremendous rake—her outside beam is 15ft. and depth 18ft. The keel is 4½ft. across the top, and about as deep in the deepest part, tapering fore and aft and vertically, and displaces over six tons of water. It is hoped she will be ready for sea in about a fortnight, and will proceed to the westward when in commission, sailing her maiden race at Liverpool on June 19."

SINGULAR ACCIDENT TO A STEAM YACHT.—The Stella is a steam yacht of 26ft. length, and 6½ft. beam belonging to a club of seven members, all of whom reside in Philadelphia, and who for the past ten years have taken weekly excursions during the season on the Delaware River and the neighboring streams. At half past 10 on Saturday night, she left her dock at Kensington waterworks with her owners on board beside two guests, being in charge of Alfred C. Neil, a licensed engineer, and Jame Cargill, a licensed pilot. Running up the Delaware, they turned into Rancocas Creek about 12 P. M., and shortly after, as claimed, blew three signals of four whistles each for the drawbridge. As they neared the bridge, a man was seen coming from the bridge tender's house to the draw, but when near by they found the latter was still closed. An attempt was immediately made to turn the boat, but the flood tide ran so strongly that she was carried broadside against the bridge, the cabin roof striking the timbers of the bridge, keeling her over so that she filled and sank. Alfred Anderson, who was asleep in the cabin, was carried down and drowned. On the afterdeck were Robert R. Coster, Jr., and John Cuthbert, an old man with a crippled hand, both of whom held to the bridge. A party arrived to help them, just as Coster after telling them to save the other, released his hold and was drowned. The remaining members of the party were picked up or swam ashore. It is claimed by the owners of the yacht that the bridge tender was asleep, while he makes a counter charge that they did not give the proper signals. The body of Mr. Coster was not found, and the yacht had not been raised at last reports.

A CANDID ADMISSION.—"As the imported cutter Madge is again to make her appearance this season with a fighting crew on board," said a yachting expert yesterday, "it may be well to reflect a moment on what has occurred in the American yachting world since her victories in New York and Eastern waters in 1881. Up to that time few men were so bold as to say that a deep boat could sail with the world renowned skimming dishes, but the manner in which the stranger disposed of her antagonists, though the measurement for time allowance was very favorable to her, caused experts to conclude that, after all, Americans, perhaps, did not know everything about the principles of speed. Since that memorable yachting year a great many changes in type and ballast have taken place among us in the designing and construction of pleasure vessels. Nowadays very few yachtsmen will have a shallow boat, except that local causes compel the selection of the type. On the contrary the majority make it imperative that they shall have good draft of water, and once pronounced advocates of light draft and light weight have made a complete aquatic somersault by building deep boats with heavy weights so that the fastest vessels of the present day in smooth water are those carrying a great weight of ballast. The feeling of the yachting public in this matter became so strong a number of cutters were built until now 'the real Simon Pure' housing bowsprit 'and a' that' is frequently seen in American waters. And, really, you must allow me to say that the cutter rig is the more beautiful to the eye, while it is the best fitted to fight old Neptune yet devised. Almost all our sloops have taken to the two-masted rig, so that long topmasts, backstays, runners, etc., are so common, critics make no remarks, except at the absence of them. All these things show that Americans have taken advantage of an example set them, and not allowed prejudice to blind them. They have adopted what seemed to be good for our waters, and, as experiments are yet being made, time alone will show what will be the final result. Boston yachtsmen have taken to a type evolved from the wide sloop, and the result is a heavy draft sloop—in fact, more draft than that of a cutter of the same length and almost the beam of the sloop. The type carries as much, if not more, weight than the cutter, is as costly to build, and requires an enormous sail area to obtain speed. Length measurement, however, combined with canvas, restricts this type to very small boats, and though great internal room is obtained, the principle is carried far enough to develop fatal errors. That is to say, large boats cannot be made to carry such sails, and even if they could, the first time they were caught outside with a big sea and no wind spars would be thrashed out of them or gear so worn or strained that owners would hesitate long before repeating the experiment. For these reasons Boston practice cannot be taken as a guide, except for very small boats. In New York the results of the trials with the Madge and other cutters have been to induce builders to timidly add more depth and slightly reduce the beam, and, while the centerboard is retained, the forestay has been put out on the bowsprit in order to obtain a better shaped forestaysail. The measurement system adopted by the prominent sloop clubs has no doubt had much to do with this, though the inability of many yachtsmen for want of time to make extended cruises and the shallowness of the water in numerous harbors are also causes which have their effect. Depend upon it, we are on the eve of a great change. The tendency is to restrict the beam and increase the depth. Once well started in this path, there is no telling where the stopping point will be, as it will soon be found that the ballast on the keel is worth more than the beam. The season of yachting now at hand may dispel much of the doubt surrounding the all important subject, and to this end the results of the many races arranged will be anxiously looked forward to by all thoughtful yachtsmen."—*N. Y. Herald.*

[A look at the fleet of yachts that will assemble three times this week on New York Bay will give convincing evidence of the victory of FOREST AND STREAM in the long fight for honest boats. The presence of a fine fleet of thoroughbred cutters, while important in itself, is no more so than the changes to be noted in the sloops of today compared with the same vessels of a few years ago, but besides such indisputable evidence, we quote the above as an index of the feeling among a large majority of yachtsmen, who have burst the shell of habit, prejudice, ancient dogmas, and so-called patriotism that has so long retarded our yachting, and are willing to examine fairly and intelligently all that is placed before them and to accept or reject on merit only.

The self-satisfaction, over confidence and unwillingness to examine or adopt anything new or unknown has virtually disappeared among the great body of American yachtsmen, while at the same time the sport has advanced proportionately. Such truths as were proven so conclusively by Madge, and were then only accepted unwillingly because they were beyond dispute, are now received readily, weighed carefully and impartially, and adopted or condemned only after a fair hearing.

The work of the last four years has made possible a fair and thorough test of the questions in dispute, many of them have already been decided conclusively, and the contests of this week open a season that promises to end the controversy finally.]

SALEM, MASS.—While yachting is not as forward as usual at Salem (perhaps owing to the backward season), there are yet signs of life. The Fortuna lays at the wharf, Beverly, having just received her summer spars and rig. Alongside was the Latona fitting up, and the sloop Ariadne, now owned by E. B. Rogers, Beverly, will come out looking finely in a white dress with hard wood upperwork. The Halcyon is yet between the bridges, so are the Nita, Clochette and one or two others. The cutter Medusa, Rice's Whitecap and Benson's Viva, with Upton's Crest, are in commission. The Salem Bay Y. C., with its new commodore, Mr. Winslow, and his new schooner, the Cleopatra, will open the season lively.

MAGGIE.—This cutter will soon be ready for the season's races, having undergone several important alterations during the spring. Some 5,000lbs. have been taken from her inside and added to her keel, part in the shape of a shoe 4in. thick and 3in. wider than the old keel, thus projecting 1½in. on either side, forming a shelf. The rest of the lead was cast in two plates, fitting each side of the keel and resting on the projecting shoe, all being held by copper bands passing under the keel and through-bolted to the hull. In consequence of this change she has been fitted with longer spars and a new and larger suit of sails.

ATLANTIC Y. C.—The times of that portion of the fleet that anchored in Gravesend Bay after the sail on Decoration Day were as follows: Daisy 3h. 1m., Tourist 3h. 6m., Viking 3h. 6m. 30s., Crocodile 3h. 6m. 45s., Romeyn 3h. 7m., Gleam 3h. 11m., Venture 3h. 11m. 15s., Genevieve 3h. 11m. 30s., Ilderan 3h. 11m. 45s., Nomad 3h. 21m., Triton 4h. 10m. 30s., Gracie 4h. 15m., Agnes 4h. 20m. In class C the Athlon won on Monday and not the Thistle, as at first reported, the prize being awarded to the former.

SOME NEW BOOKS.

EUSTES.—A novel. By Robert Apthorp Boit. Boston: Jas. R. Osgood & Co.

AN AVERAGE MAN.—By Robert Grant. Boston: Jas. R. Osgood & Co. A study of one phase of New York social life.

BUT A PHILISTINE.—By Virginia F. Townsend. Boston: Lee & Shepard. This is a new novel by a writer who is a great favorite among school girls.

IN THE SADDLE.—A collection of poems on horse-back riding. Boston: Houghton, Mifflin & Co. A comprehensive, well selected, elegantly printed little book, with all the famous rides in the poetry of adventure, love and war.

STAGE-STRUCK; or, She Would be an Opera Singer.—By Blanche Roosevelt. New York: Fords, Howard & Hulbert. Written "to persuade American girls, who come over to Europe to study music, that they might be wiser to study at home."

WHIRLWINDS, CYCLONES AND TORNADOES.—By William Morris Davis. Boston: Lee & Shepard. An essay on the theory of storms, reprinted from *Science.* The illustrations and the text together afford an admirable exposition of the subject.

EVERYBODY'S PAINT BOOK.—A complete guide to the art of outdoor and indoor painting. By F. B. Gardner. New York: M. T. Richardson. The special design of the book is to give full instructions to those who wish to do their own house painting.

PROFITABLE POULTRY KEEPING.—By Stephen Beale. Edited with additions by Mason C. Weld. New York: George Routledge & Sons. Price, $1.50. A compendium of practical information about the various breeds of poultry, with directions for their management.

THERE WAS ONCE A MAN.—A story. By R. H. Newell (Orpheus C. Kerr). New York: Fords, Howard & Hulbert. A reprint of one of *The Continent* serials. Story opens in New York sixty years ago, thence scene is transferred to Borneo in the time of the famous English Rajah Brook.

SUPERIOR FISHING; or, the Striped Bass, Trout, Black Bass and Bluefish of the Northern States.—Embracing full directions for dressing artificial flies with the feathers of American birds; an account of a sporting visit to Lake Superior, etc. By Robert Barnwell Roosevelt. New York: Orange Judd Company. A new edition of a work published in 1865. Contains a great deal of solid information, for the author is a thorough sportsman both with rod and gun. Mr. Roosevelt is a strong writer, and we have often pointed out both his beauty of style and his faults. The former are apparent on every page and the latter occasionally crop out. He has become careless in revising what was really a wonderful stock of fishing lore twenty years ago, and on issuing a new edition contents himself with adding new chapters and letting the old ones stand.

FLY-FISHING IN THE MAINE LAKES, or camp life in the wilderness.—By Charles W. Stevens. Boston: Cupples, Upham & Co. This book was favorably noticed in our columns some months ago when first published. The present is a third edition. Several pages have been added, and there are numerous very crude illustrations contributed by the author's friends. Barring these, the volume is a handsome specimen of the bookmaker's art.

WILD WOODS LIFE, or a trip to Parmachenee.—By Capt. Chas. A. J. Farrar. Boston: Lee & Shepard. This is a book about boys and for boys. The title page describes it as "A realistic story of life in the woods." It is not very realistic. The boys go through scenes which are never to be found outside of book covers, yet, we presume, youthful readers will find it none the less entertaining on that account, and we hope that Mr. Farrar may find a large audience for his yarns.

Answers to Correspondents.

☞ **No Notice Taken of Anonymous Correspondents.**

A. L. L., New York.—The specimen appears to be the warbling vireo (*Vireosylvia gilva*).

POINTER.—Bay snipe shooting in Shinnecock Bay begins in July, is best in September, and lasts into November.

QUESTION.—Are any bullets of .32-caliber made hollow or express, or would cartridge makers make them to order? Ans. Yes.

J. T. G., Keyport, N. J.—We cannot tell of any cement that is entirely reliable for your purpose. Marine glue would probably answer; but it cannot be procured here.

C. P. B., Ottumwa, Ia.—Canoes carry two flags, a club signal and a private signal, the latter at the peak of the mainsail, the former a peak of mizzen when two sails are carried.

F. P., New Bedford.—When is the law off for black bass in Rhode Island? Ans. The law of 1876, and we know of none later, forbids their capture between March 1 and July 15.

FISHCULTURIST.—How can I get the reports of the American Fish-cultural Association? Ans. Only by joining. It costs $3 per year for membership, and the reports are confined to members only.

H. C. P., Orisco, Ia.—The best book for you is "Hallock's Sportsmen's Gazetteer," which contains descriptions of all the game birds, animals and fishes, and tells how to capture them. We can supply it. Price, $3.

Z. B. W., Gloversville, N. Y.—The only change made in woodcock law of New York was printed in our issue of May 22. The season for Delaware and Oneida counties was made Sept. 1—Jan. 1; elsewhere, Aug. 1—Jan. 1.

TROUT.—1. Where can I get a book on trout raising? 2. Has a man a right, legally, to net brook trout for stocking a private pond? Ans. 1. Get "Domesticated Trout," by L. Stone. We can supply it. 2. Not in public waters, nor in private ones, without the owner's consent, and in this case the waters must be strictly private.

NOVICE, New Orleans.—1. Is a lancewood rod a good durable rod for trout fishing, and what kind and size are the trout flies used? 2. About what would a first-class canoe cost, with paddles and sail? 3. What is the name of the best reel in use and what is the price? Ans. 1. Lancewood is good. Flies of all kinds and sizes are used, according to the size of the trout and the kind of waters. 2. A first-class canoe, with paddles, sails and fittings, will cost from $100 to $150, according to size and finish. 3. We do not know whether you want a large or a small reel; they range in price from $1.50 to $18. Write to any of our advertising tackle dealers, they are all reliable.

PERCYVAL.—I am going to fish a lake in Berkshire this summer which has had 70,000 landlocked salmon placed in it in three lots, first lot in 1879. The lake is fed by springs; deep in some places, shallow in others; in some of the shallow bays are pads. The bottom is partly weedy in shallow places, and partly sandy in others. The deep spots have stony bottom, no mud. The outlet is a good sized stream and there are pads, etc., around it. The lessees of the lake allow fishing from July 1 to Nov. 1. The angling works tell very little of value about this fish and so far as I know none have been caught since the lake was stocked. I intend to try and see if any have escaped the bass and pickerel and would like to ask these questions. 1. What weight should the first lot approximate? 2. Can the fish be caught during the time mentioned? 3. In what part of the lake would I be most likely to find them? 4. What kind and size of flies or bait, if they take it, should I use? Ans. 1 Four to six pounds. 2. Yes. 3. In midsummer they will be in deep water. In the fall they may be near the outlet for spawning. 4. Use ordinary salmon flies if the shallow waters are cool. Use minnows in deep water, fishing as for lake trout.

INFORMATION WANTED.

C. H. S., Philadelphia, wants to know who invented the first American breechloading shotgun, when and where; also whether Roper revolving shotgun is older than Colt's revolving shotgun.

INVALID SPORTSMAN, Binghamton, N. Y..—Wants to know where he can locate in the South or Southwest, where winters are very mild and short, where chills and fever are unknown, where small game is plenty, where air, climate and water are healthy. In a not large village where the inhabitants are good.

LONG ISLAND TROUT PRESERVES.

A Long Island brook trout is as pretty as toothsome, while the artificial creature taken from a private preserve is no match for the wild specimen which, unfortunately for persons who are not million ires rapidly disappeared during the decade past, and such a fish is now regarded as an extraordinary prize. The time was when every stream on Long Island abounded in this game fish, but various causes have led up to a point where an angler must own a preserve, or put himself under lasting obligations to a friend who does, in order to find opportunity to throw a fly at all. While not a single stream has dried, business enterprises established along the banks have poisoned the waters so thoroughly that not even a sunfish could live in it. Other streams have been utilized by professional breeders to raise market trout and furnish young fry for stocking preserves, but the latter feature of the business, once profitable, cannot be considered so any longer, as the State Fish Commission is now supplying nearly all the young hatch that is demanded. Then, again, gentleman who have purchased and improved land extending over territory miles long in any direction have had a sharp eye to the value of swift running streams as an adornment and enrichment to country seats, and it is such who have pratically monopolized the brooks where everybody was wont to fish on chance luck. This is especially true of the south side of Long Island, so that now there is no common fishing ground, and not one person goes trout hunting where 100 used to go. There are ponds to which persons may go and fish on the distinct understanding with the proprietor that for every pound of fish hooked he shall receive the prevailing market price, so that after all the only difference between getting one's supply from the pick of the market and the pond is the satisfaction of knowing and saying that he caught the fish and thus prove his ability as a fly thrower, though it is by no means difficult to catch fish when the thousands in the pond have been starved for days to make them eager to bite. Some breeders are on such good terms with the tenants of the water that a peculiar whistle brings them swarming to the bank, and a fly thrown in from another quarter is made for with a rush, the deluded fish thinking it the regular feeding hour and the fly the first installment of the customary meal. William Furman, of Maspeth, was a fish charmer. He has removed to Smithtown. The ordinary growth of a trout, he says, is three to four inches the first year, and the maximum growth is attained in four years. There are exceptions, however. Some of the young fish grow so rapidly that they eat the smaller ones, and the careful breeder makes a specialty of keeping them properly separated. Occasion-

ally a peculiar disease attacks the fish, killing thousands in a brief time, and it is then that the greatest ingenuity is required to preserve any part of the stock. Eels, perch and pickerel are deadly enemies of the trout.

Perhaps the greatest private trout preserve in this country is on Long Island. It is owned by the South Side Sportsmen's Club, and is located at Oakdale. The club is composed of wealthy New York gentlemen, and the property is valued at $250,000. When the late Recorder Hackett was president of the club he was the champion fly-thrower, and it was his boast that he never ate a fish (at the club) which he did not hook, and he could stow away five pounds of trout at a meal and not feel distressed. The pond in which the full-grown fish are kept covers several hundred acres, and the breeding houses are maintained on a large and scientific scale. George Lorillard has a great estate and and an excellent and well stocked trout stream adjoining the club, and southward near the Great South Bay is the magnificent estate of Mr. William K. Vanderbilt, whose trout excel in flavor by reason of the stream being rendered brackish by the overflow of salt water from the bay. Mr. Lorillard is very ill in Florida, and his property, which has cost him $250,000, is for sale at the modest sum of $200,000. Mr. Vanderbilt's place has cost him $800,000. He owns twenty thousand acres of land.

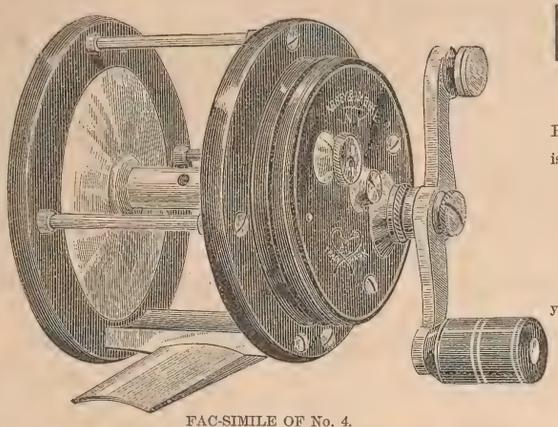
Babylon is famous for its great ponds. The notable ones are owned by Mr. August Belmont, Mr Austin Corbin, Mr. Phelps and Mr. Sutton. Mr. Belmont has been unfortunate. The poachers have troubled him a great deal, and stolen thousands of his fish. Sometimes if a pond is small, they drag a net through it. Into a large pond they throw lime, which causes the fish to show the white of their stomach and lay motionless. They are tenderly but quickly picked up and the fresh water, carried in barrels for the purpose, soon revives them. A moment's delay sometimes kills them, as they are the most delicate of water game. On one occasion it became necessary to clean Mr. Belmont's pond. The men carelessly uncovered the fish and hundreds of them were killed by the heat of the July sun. Trout can endure cold, but not the heat. The fishing in this pond is now unsurpassed. Mr. Corbin, too, has had his share of trouble with poachers. He went in for prosecuting them at large expense of money and time, but got no satisfaction, as the jury acquitted the prisoners on the ground, as was thought, that no man had any right to monopolize the products of the water. That was during the time when the common streams were rapidly falling under private control, and public sentiment was strongly opposed to it. There are some great trout in Massapequa Pond at South Oyster Bay and in the streams northward which feed it. In one stream running under the Montauk Railroad people familiar with the fact never lose an opportunity to catch a passing glance of the frightened fish that abound there and shoot out in small schools as the trains pass over. The brook is half a mile long and the fish find natural food in it upon which they thrive better than those artificially bred. Thompson's Pond at Noyac was once a famous stream, but at present is somewhat inferior through damages by freshets and the unneighborly conduct of some of the residents. It is a picturesque place where the city folk go to enjoy a trout dinner instead of to fish. New Canaan, a wild region north of Patchogue, is the home of many professional breeders who, in very small space, raise such an incredible quantity of fish as to place them in the category of poachers.—*Brooklyn Eagle.*

HUMPHREYS' HOMEOPATHIC VETERINARY SPECIFICS

FOR THE CURE OF ALL DISEASES OF
Horses, Cattle, Sheep, Dogs, Hogs & Poultry.

For Twenty Years **Humphreys' Veterinary Specifics** have been used by **Farmers, Stock-breeders, Horse R.R., Travel'g Hippodromes Menageries** and others with perfect success.

LIST OF SPECIFICS.



A.A. Cures **Fevers** and **Inflammation**, Milk Fever, Spinal Meningitis, Hog Cholera, **25c.**
B.B. Cures **Founder, Spavin**, Stiffness, **75c.**
C.C. Cures **Distemper**, Nasal Discharges, **75c.**
D.D. Cures **Bots** or **Grubs**, Worms, - - - **75c.**
E.E. Cures **Cough, Heaves**, Pneumonia, **75c.**
F.F. Cures **Colic** or **Gripes**, Bellyache, **75c.**
G.G. Prevents **Abortion**, - - - - - - - **75c.**
H.H. Cures all Urinary Diseases, - - - - **75c.**
I.I. Cures **Eruptive Diseases**, Mange, &c. **75c.**
J.J. Cures all **Diseases of Digestion**, - - **75c.**
Veterinary Case (black walnut) with Veterinary Manual, (330 pp.), 10 bottles of Medicine, and Medicator, - - - - - - **$8.00**
Medicator, - - - - - - - - - - - - - **35**

☞These Veterinary Cases are sent free to any address on receipt of the price, or any order for Veterinary Medicine to the amount of **$5** or more.

Humphrey's Veterinary Manual (330 pp.) sent free by mail on receipt of price, 50 cents.

☞**Pamphlets sent free** on application.

Hornbeam Rods

A SPECIALTY.

W. HUNTINGTON,

WILTON, CONN.,

Makes a specialty of the manufacture of FINE HAND-MADE RODS of Hornbeam for fly-fishing. Every fly-fisher should have one of these rods, for whatever preference he may have these are the only thoroughly reliable rods, secure against breakage and capable of real hard usage. With one of these rods a sportsman may venture into the woods for a season and take no other rod, and be fairly sure of returning with it in serviceable condition. As made from wood of my own cutting and seasoning, they are powerful, easy in action and full of endurance. For circular send to WALLACE HUNTINGTON as above.

Black Flies--Mosquitoes.

NO TAR, NO OIL.

"I find the 'Angler's Comfort,' made by N. S. Harlow, of Bangor, Maine, the most effective and satisfactory preparation I have ever used to keep off mosquitoes, black flies, etc." E. M. STILLWELL
Commissioner of Fisheries and Game for the State of Maine.

Orders by mail solicited. Retail, 25 cts., postage free. Wholesale, usual discount.
N. S. HARLOW, Druggist, Bangor, Me.

Oil-Tanned Moccasins.

For Hunting, Fishing, Canoeing, &c. They are easy to the feet, and very durable. Made to order in a variety of styles and warranted the genuine article. Send for price list. MARTIN S. HUTCHINGS, Dover, N. H., P. O. Box 868.

DAME, STODDARD & KENDALL, Boston; HENRY C. SQUIRES, New York; F. CHAS. EICHEL, Philadelphia, Agents.

JAS. F. MARSTERS,

KYNOCH'S
Patent "Perfect" Brass Shells,

MANUFACTURED BY

KYNOCH & CO., Birmingham, Eng.

These shells are made of extra fine thin pliable metal, with reinforced base; are adapted to either Winchester or Wesson No. 2 primers. Can be reloaded as often as any of the thicker makes. **Cost only about half as much.** Weight less than paper shells. They shoot stronger and closer, and admit of a heavier charge, as owing to the thin metal, inside diameter is nearly two gauges larger. Load same as any brass shells, using wads say two sizes larger than gauge of shells. Or can be effectually crimped with tool and straighten out to original shape when discharged. **The crimping tool also acts as a reducer,** an advantage which will be appreciated by all experienced sportsmen. Sample shells will be mailed (without charge) to any sportsmen's club or dealer, and prices quoted to the trade only. For sale in any quantity by gun dealers generally, or shells in case lots only, (2,000), and crimpers not less than one dozen, by

The "O.C." New Model Patent Perfection
TREBLE MULTIPLYING REEL,
WITH CLICK ATTACHMENT,
Is the handsomest and most practical Reel Made.

Following are its points of excellence:

Center Action, an entirely new feature for a multiplying reel.

Balance Handle, revolving within a projecting metal band, no chance for line to catch upon the handle.

A Treble Multiplying Click, when the index is in the position as shown in the above illustration.

A Treble Multiplying Free-Running Reel, when the index is pushed to the right.

Raised Pillar, permitting the extension of the spool, thus increasing the carrying capacity of the reel fully one-third and greatly reducing the weight. **Material and Finish, the best. Price,** "within reach."

Please order the above "Patent Perfection Reels" through the *Dealer in your place.* If for any cause you can not so obtain them, please advise me and I will correspond with you.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JUNE 19, 1884.

VOL. XXII.—No. 21. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted. Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

ANSWERS TO CORRESPONDENTS.
PUBLISHERS' DEPARTMENT.

JUNE WOODCOCK.

EVERY year, as regularly as the seasons roll around, come the complaints of those various individuals who go out for game-bird fledglings. Our correspondents are quite inclined to find fault with the exploits of these gentlemen, and usually heap abuse upon them. This spirit is hardly commendable. Undoubtedly the aggravation is great, and writers lose their temper only under great provocation. They see the game birds destroyed out of season; and then they fly into a passion and write to us to denounce the men who cause their woe. This is, we need not say, entirely wrong. Instead of getting mad and writing to a distant newspaper about it, they might better keep their temper and secure the punishment of the bird destroyer.

There are two classes of these destroyers of the early bird. Each is made up of individuals whose mental and moral development has been stunted. There is the man who has some dogs to break, and thinks that he must go into the game covers in the spring, rout the mother bird from her nest and let his canine pupil poke its nose into the eggs. Later in the season, if his pups can manage to catch some of the fledglings, so much the better. He lacks the sense requisite to comprehend that a bird chewed up by a puppy is just as dead as if riddled by a large charge of shot. The proper way to give him a hint on the subject is to enlarge his brain capacity by sequestration in a cell, or tapping his pocketbook to the extent of the fine in such cases made and provided. This is apt to accomplish even more than can be secured by writing to FOREST AND STREAM, which we are quite willing to acknowledge is often an effective means.

The idiot who takes his young dogs into the nesting grounds is an altogether different specimen from the sneak who goes in for getting the immature birds for the alleged reason that if he don't some one else will. The former lacks common sense, the latter wants common decency. His plea is that of a common felon. "If I don't some one else will" has been the cowardly excuse for almost every crime known to the calendar. The man who slides off into the woods in June, and makes this a defense for his misdemeanors, has a spirit so contemptible that honest men will fail to understand it. How any one who professes to practice field sports for the pleasure there is in them, can find any enjoyment in lugging home at night a bag of birds, and with it the load of his consciuasness that he has done a mean and unlawful deed, is something quite beyond our comprehension. Can any one explain it?

THE POINTER DISCUSSION.

A PORTION of the great mass of correspondence on this subject will be found in our Kennel columns; another portion we decline to publish. We have before called attention to the fact that, if pointer breeders are to be benefitted by this discussion, it must be conducted temperately and must be confined to the question at issue. If this is not done, what should be an argument between gentlemen degenerates into an unseemly wrangle from which no one can emerge with any credit. Some of the letters which we print this week we regret to say wander lamentably from the subject, and cover a vast deal of ground which is wholly foreign to it. Is it quite impossible for those who write about dogs to stick to the point? The question at issue is about certain dogs. Can correspondents not confine themselves to those dogs and say where they are good and where bad? For ourselves we have no desire to mingle in the fray. Our decisions are matters of record to which any one can refer.

It is somewhat amusing, however, to observe how those on each side in the debate seem to imagine that, because we do not at once espouse their cause, we are therefore secretly abetting their opponents. Within a day or two of each other, and just after our editorial two weeks ago on "The Pointers at New York," we received among the numerous letters on the subject two from gentlemen on opposite sides of the question especially interested in the matter, from which we quote below:

One said:

If you have any personal reason for not wanting anything to appear in the paper against ——— or ——— I shall have nothing more to say, and will respect your private affairs accordingly.

The other said:

The fact that they know a good dog and are friendly to me should not be sufficient reason for putting their letters in the waste-paper basket.

Now, of course, if these gentlemen had given themselves the trouble to think about the matter at all, they would not have taken the further trouble to write such silly stuff as the above, but they did not stop to think. It is rather late in the day for us to say that we are not pecuniarily interested in dogs, and have no private reasons for excluding communications from our columns. But we certainly shall not publish matter that, in our judgment, will fail to interest our readers. Communications must keep more closely to the subject in hand, and should contain something that will instruct. We hope that this hint will suffice.

NEW YORK MOVES TO INCREASE THE OYSTER.

GOVERNOR CLEVELAND has just signed the bill which was introduced into the last Legislature of New York, by Gen. S. W. Johnson, of Mamaroneck, Westchester county, which constitutes Mr. E. G. Blackford, of the New York Fish Commission, also a commissioner for the protection and propagation of oysters. This bill, which was suggested to Gen. Johnson by his constituents, reads as follows:

"For the Commissioner of Fisheries, appointed under Chapter 309, Laws of 1879, $5,000, to be expended as said Commissioner may deem proper upon vouchers to be approved by the comptroller, for the purpose of investigating into the causes of the decrease of oysters in the waters of the State of New York, and into the extent of the injuries made by the starfish and other animals that attack the oyster, and for the purpose of ascertaining how the oyster industry may be protected and the supply increased."

This is a good beginning, and will, no doubt, be followed with good results. We have on several occasions pointed out that New York should follow the lead of Connecticut, which has a perfect system of leasing oyster grounds, which, after three years' trial, gives satisfaction to the oystermen. Mr. Blackford will avail himself of the experience of Lieut. Francis S. Winslow, of the United States Navy, who has given much thought to the oyster question, and is familiar with the oyster grounds of the State, if he can be detailed for this purpose. Prof. H. J. Rice, whose labors in the study of the embryology of the oyster are familiar to our readers, will also be engaged on the work, and the hatching station of the New York Fish Commission at Cold Spring Harbor will, in all probability, be selected as the site for operations in oyster culture, as it is most favorably situated for the work.

THE ADIRONDACK FORESTS.

IT is understood that Governor Cleveland has withheld his signature from the Adirondack forestry bill, and consequently there will be no commission this year. There was, however, in the appropriation bill a clause devoting $5,000 to the employment of three experts to prepare a report on the Adirondack forests, to be presented at the meeting of the next Legislature. This clause, according to the published reports, has received the Governor's sanction, and so we may hope for progress in the movement to protect the Adirondack woodlands.

We understand that before his recent departure for Europe Mr Morris K. Jesup made arrangements to have a party go into the Adirondacks at his expense, in case the State made no appropriation. This party was to be under the direction of Professor Sargent of Harvard. It is to be hoped that Comptroller Chapin will as soon as possible select the investigating committee, as he is empowered to do by the clause referred to, and that the board so appointed will at once enter upon their important work.

PRESIDENT ARTHUR'S RECORD.—Last Monday President Arthur and Secretary of War Lincoln went down to Long Island on an angling excursion. They fished for trout in the Massapequa Lake, which is a preserve owned by Mr. William Floyd-Jones. Now, the ordinary angler can go fishing and come home at night without saying boo to anybody. But when the President of the United States wets a line the great metropolitan journals send their representatives to intercept the tired fisherman and learn his luck. So when the two returned to the Fifth Avenue Hotel the other evening, they found their passage blocked by a horde of reporters, who wanted to know all about it. President Arthur made a plea of having other fish to fry, and escaped. Secretary Lincoln consented to say something, but not much. He refused to tell how many fish were caught. To a *Times* reporter who asked how the fishing was he replied, "Well, as good as could be expected. It's pretty late in the season;" while to a *Sun* reporter he explained: "We had a very enjoyable time, although it is a little early for good fishing." What is to be inferred when a President and a Secretary of War go fishing, and in place of showing a handsome "mess of trout," allege to one that it was too late for fishing, and to another that it was too early? We confess that it appears as if the catch that day must have been an exceedingly meagre one; but we shall not hastily, nor strenuously, insist upon such an interpretation of Secretary Lincoln's prevarication.

MARKED TROUT.—It is the custom of some of our fish commissioners to attach metal tags to liberated salmon, that when captured again, the growth of the fish may be noted. We once knew an angler who was in the habit of putting his mark on trout; but he did not use a metal tag. It was a rule with him to retain no trout that weighed less than one-half pound. When he landed one of less weight, he would carefully take it from the hook, mark it by biting off the upper portion of its tail fin, and throw it back into the water to grow. Sometimes he would catch these fish again after they had attained the proper size to find a place in his basket; and it was often a source of pleasure to him to receive a letter of thanks from some fellow angler who had chanced to take one of the marked big fellows. One day this biter of trouts' tails was driving along some eighteen miles from home, when he came to a bridge over a stream, and in passing saw a big trout rise. The next day, with his tackle, he drove back over these eighteen miles and tried for a rise. He found not a sign of trout. The next day he made the journey again, with a like result. The third day, nothing daunted, he drove out again. This time he pulled out a three-pound trout. The upper half of its tail fin was gone; and our friend has always believed that it was one of his marked trout.

THE REFRACTORY PIGEONS.—The New York State Association for the Protection of Fish and Game, are trying to find out where the wild pigeons are nesting, so that they may hire the professional nest robbers to collect a few thousands of birds to be protected by the Association at the Buffalo tournament. This scarcity of wild pigeons is seriously interfering with the progress of game and fish protection in this State, and the protectors may well ask each other what is to be done about it. An unsubstantiated rumor is abroad that clay-pigeons may be substituted for the live birds, but as every practical man knows, there is nothing so potent for true game and fish protection as four or five thousand wild pigeons, captured on nesting grounds and shot at the trap,

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

III.

THOUGH in mid-day there was yet a hazy after-taste of the sweetness of Indian summer, the season was beginning to have a smack of winter in its night air. On such an evening, as the first star began to shine above the rounded peak of Tater Hill, Lisha rubbed the mist off a pane of his long, low shop window, and stooping his eye to it peered out upon the darkening road. Out of the gloaming presently grew some dark shapes into men, the sound of whose footsteps and voices came a little before them. When they and others had entered and been welcomed by Lisha, he having lighted his pipe and taken some work in hand, declared "the meetin' open," and that they "was all ready to transack business." Little was said till some one remarked, "Pwheeew!" And then all became aware that an odor more pungent and powerful than those of leather and shoemaker's wax was pervading the atmosphere of the shop.

"Good airth an' seas!" cried Lisha, "I secont the motion! Le's all whew! Some on ye stepped on suthin' t'night, or somebody got skunk's ile to sell."

Each took a sniff of his neighbor till the source of the fragrance was traced to Pelatiah's corner, when he shamefacedly confessed that he "hed ben a trappin' a leetle," but said in extenuation, "I sot fer mink. I hed one trap sot in a holler log over to Hillses' brook with a ruster's head fer bait, an' when I went tew it yist'day the trap was hauled' int' the log. I pulled on the chain c'nsid'able stout, but it didn't le' go a bit, an' then I god daown on all fours an' pecked in to see what the matter was ailded it, an'—O, gosh all Connet'cutt! My eyes haint god done smartin' yit! I rolled an' I tumbled till I got to water, 'n' then I washed an' rubbed an' scrubbed till I c'ld see suthin' 'sides stars and fire, an' then I went hum an' berried all them close, an' washed me in three waters an' smudged me with hemlock browse, an', gosh darn it all, I didn't 'spose I wa'n't all sweetened aout! 'F my comp'ny haint 'greeable I'll dig fer hum."

"Sho!" Lisha shouted with hearty politeness, "Guess we c'n stan' it 'f you can! 'S fer me, I ruther like a leetle good fresh skunk parfum'ry. The's some 'at eats 'em"—rolling his eye toward a known mephitipophagist—"an' I sh'd think them 'at likes the taste would the smell. Furdermore, I'm beholden to skunks fer c'nsid'able myself. Keep yerself comf'table, Peltier."

No one objected to Pelatiah's presence, and several asked Lisha how he was indebted to skunks for anything.

"Wal," said he, slowly scraping the sole of a boot with a bit of broken glass, while his thoughts went backward over the rough path of his life, "in the fust place, when I was a leetle chap they cured me o' croup with skunk's ile, which they gi'n it ter me spoo'ful arter spoo'ful, an' greesed my stomerk with it outside tew. An' then arter I'd got growed up, skunk essence cured me of azmy. An' then—I don't scasely b'lieve I'd ha' ever got Jerushy 'f 't hed n't a ben fer a skunk!"

After the "wal I swan's," and "goshes" and "yeou don't says," which this declaration called forth, there was a general demand for an explanation, and Lisha laid down his boot and glass, and devoted himself wholly to the telling of his story, with his elbows on his knees and locking and unlocking his waxy fingers as he talked, as if so he wove the woof of his tale.

"I never sot no gret on ole folks tellin' of what they'd did, or ben, or hed when 't they was younger, but when Jerushy was Jerushy Chase she was 'baout 's pooty a gal as c'ld be dug up in tew three taowns, an' as smart and cap'ble, an' nat'lly she was sought arter, an' none the less cause her father was tol'able well off. When I begin a sparkin' on her, I hed n't nothin' much but my tew hands, was a workin' aout by the month for this one an' that one for six or eight months, an' I'd larnt to shoemake a leetle so 's 't I 'whipped the cat' winters, so ye see I was arnin' suthin all the time, an' I wa'n't sech a humbly ole critter 's I be naow, so 's 't stood jes 's good a chance as any o' the fellers, till bimeby the' com a chap to teach aour deestrick school, a college feller f'm Middlebury. He was a clever creeter, an' smart, an' good natered an' hahnsome, c'ld rastle like a bear, 'n' sing like a boblink, 'n' wore hahnsome close evey day, so all the gals 'most wus a ravin' an' a ravin' arter him. Jerushy wa'n't, though, an' that made him the faster and fircer arter her. An' so arter a while his pooty talk an' hahnsome close an' all them college things begin to work on her, 'n' she get so 't she'd mos' lives I would n't come Sunday nights as not.

"So it run along till tow-wards the middle o' sugarin', she a favorin' him a leetle mor'n me of the tew, an' the' was goin' to be a gret sugarin' off to Hillses, 'n' most everybody hed a *in*vite. I went 'n' ast Jerushy to go 'long with me, 'n' she said she 'didn't know; guessed she'd go 'long with the one 'at come arter her fust.' Thinks sez I, Mr. Schoolmarster, 'f you get to Uncle Chase's 'fore I dew, you'll hafter pull foot for it lively. So 'long in the middle o' the art'noon I got my chores all done up, an' dressed me an' off. I put 'crost lots, 'n' I hedn't got fur when darned if I didn't see that 'tarnal schoolmarster jest agoin' int' the aidge o' Meeker's Woods, pintin' for Uncle Chase's, 'n' nearer tew it 'n' I was. I doubled my jumps an' got there, an' tole Jerushy I'd got there fust 'n' she'd got to go 'long with me. She kinder hung off, lookin' outen the winder every onct an' awhile, but nary a schoolmarster! An' so bimeby she got rigged up an' off we went an' had a gret carummux to the sugarin'. She kep' a-sythin' an' a-peekin' fer a spell, but nary a schoolmarster, an' then she got desput jolly 'n' made more fun 'n the hull toot on 'em. Goin' hum in the moonshine, I ast her to jine me in a sugarin' for life, an' 'fore we got to the chips in the do'yard she 'greed she would, an' here we be! Me on this 'ere shoebench, an' she," lifting his voice and pointing a waxy forefinger at the door that opened into the kitchen, "an' she a-peekin' through the crack o' that 'ere door!" The door squeaked suddenly to, and the wooden latch clicked rather spitefully.

"Wal," said one disappointed auditor, breaking the short ensuing silence, "Wha'd all that hev ter dew with a skunk?"

"O, nuthin' much," said 'Lisha, "only, ye see that feller was a shovin' 'long the best he knowed, through the woods in a wood road, an' fust thing he run spat ont' a skunk aout takin' a walk. The skunk wouldn't run, an' he wouldn't, an' it turned aout con'try to scriptur. The battle *was* to the strong, an' the race *was* to the swift. The schoolmarster smelt loud 'nough to fill a forty acre lot, an' so the' wa'n't no schoolmarster ta Chases' nor t' the sugarin-off, nor t' the school in that deestrick that spring, nor nothin' left on him in the deestrick but his parfume So ye see, a skunk hed suthin' ta dew with his scaseness, which I c'nsider myself c'nsidable beholden to skunks."

"Bah gosh!" said Antoine, "ah don' fred for skonk, me! Ah tek hol' of it hees tails an' lif' 'im aup, he can' do sometings! No sar!"

"'Twouldn't make no diff'ence tew ye if he did," said Lisha, "a skunk's nat'ral weepon haint nothin' but double d'stilled biled daown essence of inyuns, 'n ye couldn't hurt a Canuck wi' that."

"Bah gosh, guess you fin' aout 'f he hurt you, you git him on you heyesight, whedder you Canuck or somebody. Ant it, Peltiet, hein?"

Said Solon Briggs, "Might I a-rise to ask you, Antwine, Anthony, or Anto ni-o, all of which I suppose you ter be, haow dew you pervent the aout-squirtin' of the viles o' wrath whilst you air a-proachin' of the mestiforious quadruple head?"

"Wal, M'sieu Brigg, dat someting you got t' larn bah—ah—what you call it, pracsit?"

"Prehaps Peltier 'd lend ye one o' his'n to practyse on, Solon," Lisha suggested, but Solon expressed no desire to acquire the art of capturing skunks by that method.

"The y ra'ly can't scent when you hol' 'em up by the tail, 'n' that's a fact," said Joseph Hill. "I remember onct when I was a boy ten 'r dozen year ole—I d'know, mebby I was fourteen—lemme see, 'twas the year 't father hed the brindle caow die 't hed twin calves; got choked with an apple—no 't wa'n't, ' was a tater—they was fo' ye'r oles when he sole 'em, the fall 't I was seventeen—no, I wan't but thirteen—the' was a skunk got int' the suller, 'n' of course we didn't want to kill him there, so my oldest brother, Lije, he took a holt on him by the tail an' kerried him aout the hatchway with a pair o' tongs, an' then he gin him to me an' I hel' him up while he shot him. He put the ole gun clus to his head an' blowed him clean aouten the tongs as fur 's crost this shop, 'n' by gol, he never scent one mite till then, no more 'n a snowball."

"Did he die?" asked the ever alert seeker after useful knowledge.

"Why, yes," Joseph replied, "he jes stunk hisself to death then."

"Jozeff," said Lisha, "that 'ere puts me in mind of the Paddy. 'Divil a nade o' shootin' him,' says he; 'lave him alone an' sure he'll shtink himself to death.' What a 'tarnal time the creeturs dew hev wi' skunks 'fore they git 'quainted with 'em. 'Member the ole story one on 'em tole? What was't Sam?"

Sam repeated the time-honored tale. "The furs toime iver I wint hoontin' in Ameriky was wan day whin I was gown to me worruk, an' I kilt a boird call't a skoonk. I threed hur undher a hayshtack an' shot hur wid me sphade, an' the furs toime I hit hur I misht hur, an' the nixt toime I hit hur where I misht hur afore. An' whin I wint to plook the feathers off hur, I was foorced to shkin hur, an' in doun that I shtruck hur ile bag or hur heart I dunno, an' the shmell nearly suffocaytit me, an' I was near shtarvin' afther, for divil a dhrink cud I take, but the shmell of hur was in me noshtrils to kape me awake all night.' I like to died," Sam continued, "to hear Joel Bartlett's Irishmun tell 'baout the fust skunk 't he ever met. 'Twas when he was in Masschusitts, 'Maxacushin' he called it. He ben a workin' on a railroad, an' lived in a shanty as yit though he was workin' fer a farmer. Sez he, 'I wor a shpadin' round threes in a yoong archard, an' Tom Egan, the divil, was in id wid me, an' I seen caperin' troo the grass a foine shlip av a young cat, an' says I to Tom, says I, begob, I'll capshure it to kill the mice in the curse o' God shanty that's near dhrivin' me dishthracktit. 'Do,' says he to me, an' the divil knowin' in his own moind what it was. An' away I wint in purshuit, an' whin I was about to lay me two hands on id, I was shtruck in me face an' the two eyes av me wid a shtream av the divil's own wather an' I was blindit an' shtrangled, entirely. But I joomped on the baste wid me boots an' kilt it, I was that choked wid rage, an' a grea' d'l beside, an' thin I wint away back to Tom, but divil a near him wud he let me come, the bl'guart, an' I call't out, 'Tom!' says I, 'am I kilt entirely an' is it me, or is it the divil's father of a baste that be's makin' the notorious shtink altogether?' says I. 'Be gob!' says he, 'its the both ov yees, an' ye'll shmell that bad an' may be worse for a year,' says he. 'Ah thin,' I cried, 'millia murthers, I'm ruinaytit!' an' so skoolked away home to the curse o' God shanty, an' whin I wint in Biddy an' the childher wint out, an' I had the shanty an' the shmell all to meself. Well, I berrit me close, an' I sailed back an' forth troo the pond o' wather till night, but divil a much bettber did I shmell for a week. Oh! bad luck to the counthry that nurtures such cats!"

"Dat Arish," Antoine remarked, "a'nt spik so good Angleesh lak ah do, don't it?"

The slim candle in the sconce had burned so low that when Lisha attempted to snuff it with his fingers he pulled it out and it dropped upon the floor, and sputtering out left the shop in darkness except for the thin streaks of firelight that shone through the cracks of the stove, and the dim rays of stars slanting in at the little window. The mishap was accepted as a unanimous vote of adjournment, and stumbling and groping their way to the door, Lisha's guests again departed.

A SUMMER CAMP GROUND.

WAGON Wheel Gap with its hot springs, fine scenery, altitude of 8,305 feet, invigorating air, abundance of all kinds of game and large trout, may not suit the tastes of all our Eastern tourists and sportsmen, so I will continue to give a few more of the many interesting points on this great mountain railroad, called by all who have ever traveled it "the great scenic route."

The writer during last fall traveled over the Denver & Rio Grande Railroad from Denver to Salt Lake and stopped off, camped, fished and hunted at six different points on the line, and all he can say is that no sportsman can go amiss for game of all sorts and speckled trout in abundance, at any point he may select after the train leaves Pueblo, Colo.

The first point of great interest to the tourist or sportsman is the Royal Gorge or Grand Cañon of the Arkansas. Here deer and mountain lions are plenty. The former are frequently seen from the windows of the passing train.

The Grand Cañon has been lauded in many of the daily papers throughout the land. It must be seen to be appreciated. The English language cannot describe it. From the entrance, for eight miles, there is an ever-changing scene of Nature's greatest work. Above you the peaks rise to the giddy height of 3,000 feet. Below the river rushes and falls over the craggy rocks. As you penetrate deeper into the cañon the walls appear to close on you, until a mere fissure of thirty feet is left for train and river to pass, while the smooth granite soars to the very clouds above. Here is an iron bridge, built lengthwise, and suspended on steel trusses mortised into the rock at either side. At this point the grandeur of Royal Gorge culminates. The next point of great importance is Marshall Pass, where you cross the Sangre de Cristo range, at an altitude of 10,508 feet, in a palace car. Here the sportsman enters the great game country of the world.

Continue to Sapinero, and if you desire elk, bear, mountain sheep, mountain lion, blacktailed deer, grouse and mountain trout as large as your arm, go to the Roaring Forks of the Grand River, about thirty miles from the railroad. If you want all but the elk, go to the eating station called Cimarron. Here are fine camping grounds and the very best fishing and game grounds. Here you can camp within a mile of the station and can start a deer any time within one hour's travel. Grouse here are very plenty and easily got at. There is a large pool here formed by the confluence of the Cimarron Creek and the Gunnison River, which will suit all lazy fishermen. One can sit on a large rock and drop his fly and take off from his hook fine trout just as fast as he can handle them. Last August the old Irish bridge tender was watching me play a taking fly at this point, when this pool seemed literally alive with large fish. I and my fifteen-year-old son had caught out of this one place thirty-seven pounds in less than one-half a day. Our Irish friend says: "By jabers, I hive bin troying to clane this houl out of thim for the past four months, and jist luck at thim. How miny do you think there is lef yit?" I answered him I thought by appearances that it must yet contain about twenty barrels of trout.

One of the remarkable features of this great game world is that since the Indians have been removed game of all kinds is rapidly increasing. Many of the old Mormon settlers, who have lived in Utah for the past thirty years, say that deer are more plenty to-day than when they first came to Salt Lake.

If our Eastern men wish only deer shooting and trout fishing, let them go on to Pleasant Valley Junction and remain until late in October or November, when the deer cross in this vicinity from the Wasatch range of mountains to the south seeking a country having less snow than the northern range. Very little hunting is done in Utah, and deer and grouse are perhaps more abundant than anywhere in the world. The following seems almost incredible, but it is nevertheless based on facts:

The writer was one of a party of three at Pleasant Valley Junction on a deer hunt late last November, when the snows were heavy in the upper Wasatch range, and the deer were traveling south in great numbers. We killed eleven in one day, and had all we wanted. While getting them to a wagon road to take them to the railroad, the writer counted, in a barren space of their trail south, forty-seven deer passing in two hours' time. Here much of the keen sport of hunting for this game is lost to the true sportsman. On visiting this spot, through which no doubt thousands of deer pass during a comparatively short time in the late fall, the snow was beaten down the same as though a large herd of sheep had been driven over it.

These are all black-tailed or mule-eared deer. Colorado has many white-tailed or red deer, but Utah has none. This conclusion was formed last fall after hunting over a great portion of the Territory, and watching the market in Salt Lake City for the whole of last season and not seeing one red deer. To an old deer hunter of the Eastern States shooting the black-tailed deer of the West would be tame sport indeed, because they have none of that foxy cunning which is always found in the red deer. The black-tail will often stand while a good marksman will kill five or six. I have known a market hunter to kill a band of seventeen within a radius of less than 200 yards, and this was done without a magazine gun, by a Mr. Woodard on Powder River in Dakota. In that same vicinity I caught a large doe with a greyhound, dressed it and started toward camp; and inside of one hour we came across the same band, and our dog caught and killed the second doe. The reader will naturally ask how I know this was the same band. Because the first band had one buck and nine does, and when we came up to them the second time there were but eight does and one buck, a coincidence not to be accounted for in any other way. In my next I will describe how we caught a buffalo calf with three greyhounds. Q. VAN HUMMELL, M.D.

IDAHO SPRINGS, Colorado.

Natural History.

A BIT OF A SERMON.

BY permission of the writer we are enabled to print some extracts from a private letter which furnish an eloquent sermon against summer shooting. The facts speak for themselves so forcibly that no comment on them is required. The observations here related will be no less interesting to the naturalist than the sportsman, and by whomever read, the story is an interesting one:

While strolling on the banks of French Creek, near Clayton, on Sunday last, June 8, in company with my wife and a friend, we started a woodcock, which feigned being wounded, and gave utterance to the most plaintive squeaks, from which we inferred the nest must be near. A short search discovered it among some small bushes on the ground in a comparatively exposed position. The nest contained three eggs, which we, of course, did not disturb. Leaving the nest for over an hour, I cautiously returned, and getting on my hands and knees crept within ten feet of it without disturbing the old bird. After watching her for about ten minutes I saw her stand up in the nest and with her bill and one foot change the position of two of the eggs, after which she settled back on the nest.

She then evidently saw me, for she gave a sudden twist sideways with her head and then slowly and cautiously stretched herself out as flat as possible, her bill resting flat on the ground. She remained thus for fully five minutes. Presently I arose from my position and stepped forward, when the bird quietly sneaked away from the nest, seeming to crouch as near the ground as possible, until about twenty feet away when she arose with the usual cry, but immediately fell to the ground, fluttered up and down and finally turned over on her back fluttering her wings as if in the last agony, but as I approached she scrambled away, dragging one wing on the ground until she had led me fully two hundred yards from the nest, when suddenly she bade me *au revoir*, and darted away like a rocket. Secreting myself some distance from the nest, in fourteen minutes I was surprised to see her sitting on it as quietly as before being disturbed, but how she reached there I am unable to say, as I did not see her ap

proach, and half a minute before her reappearance on the nest nothing was to be seen or heard. As the woods were open I had an excellent opportunity of watching her interesting manœuvers and had hoped to be able to note the manner in which the return would be made.

I wish that some of the advocates of July woodcock shooting could have seen the devotion of the mother bird, and their views might be modified; and should these eggs be hatched now what pleasure would there be in shooting on Aug. 1 a mere chick, six weeks old?

I wish our State law for woodcock read for every county alike—Sept. 15 the first day of the woodcock season.

As I wrote you some time since, I once found mere fledglings in July, but this was the first opportunity I ever had of watching the old bird on her nest. I had always supposed the nest was hidden in the depths of some swamp, but this was on high ground, in a maple grove interspersed with hickory and oak, and there was no apparent attempt at concealment, for it was visible anywhere within a radius of fifteen or twenty feet, and was built entirely of grass and small leaves. ONONDAGA.

NORTH AMERICAN BIRDS.

TEN years have elapsed since the publication of the first three volumes of "North American Birds," by Messrs. Baird, Brewer & Ridgway, and now we have the fourth volume. The first three covered the land birds, and the last two are to complete what will be the greatest work on American ornithology since the time of Audubon.

The delay in the completion of the work has been due to its great cost, no publisher having been found who was willing to assume the risk of carrying it out to its end. That we have now the first of the two concluding volumes of the series is due to the liberality of Prof. J. D. Whitney, late State Geologist of California, and of the Director of the Museum of Comparative Zoology of Cambridge, Mass. The present volume is issued as the twelfth of the Memoirs of the Museum, and like those which have preceded it, reflects credit upon the institution which sends it forth. Although "issued in continuation of the publications of the geological survey of California," in its appearance, manner of illustration, and general make up, the present volume resembles the first three of the "History of North American Birds," and the authors being the same, it is, as a matter of fact, the continuation of that work. It is true that the lamented Brewer did not live to see the printing of the first volume of the water birds begun, and that portion of the work assigned to him has suffered in consequence of his death. Prof. J. A. Allen has, however, completed some of the unfinished articles, and like all his work, it is well done.

This work, therefore, coming fresh from the hands of our most eminent ornithologists, being the most recent work of the kind, and being gotten up without regard to cost, cannot fail to appeal very strongly to every ornithologist. Certainly it is high time that we had these volumes, for, with the exception of the material in "Birds of the Northwest" and "New England Bird Life," nothing systematic has been published on the water birds of America for very many years.

The present volume carries us, beginning with the herons, through the so-called wading birds, and well into the *Anatinæ*, the cinnamon teal (*Querquedula cyanoptera*) being the last species mentioned. The concluding volume, which is promised in September, will carry us through the water birds, and the greatest modern work on American ornithology will be completed. The descriptive portion of the work is indeed quite beyond criticism, and it is made more valuable by the numerous excellent figures of the heads, and outline sketches of bills of different species which are scattered everywhere through the text. At the same time we cannot help regretting that the part devoted to the biographies of the water birds should be, as is apparently now the case, somewhat behind the times. Some years have elapsed since the manuscript was prepared for publication, and while the technical and descriptive portion of the work has been revised so as to bring it down to date, a considerable portion of Dr. Brewer's work gives no evidence of having been treated in the same way.

Thus, the biographical sketches of the different species are much the least satisfactory portion of the work. They consist almost altogether of citations from different authors, giving very fully the distribution of the different species, but not telling us as much about their habits—their real inner life—as we should like to know, and even as regards distribution we find that the work is by no means brought down to date, and that many interesting observations in the West and elsewhere by some of our best observers—men like Ridgway, Henshaw and Merriam, for example—are not mentioned.

The volume appears to be singularly free from errors, though occasionally a loose statement has crept in. Such, for example, is the statement that the habitat of the upland plover (*Bartramia longicauda*) is "Eastern North America, migrating to Brazil and Peru and extending north to Alaska and Nova Scotia." As a matter of fact, the range of this species extends in the Northern United States west nearly if not quite to the one hundred and twelfth meridian, while further south, near the fortieth parallel, we have ourselves seen it near the bend of the Platte in Western Wyoming, Ridgway took it on Kamas prairie in Utah; Abert is reported to have sent one from New Mexico, and Henshaw took one in Southeastern Arizona. With all these references it seems scarcely proper to call it an "Eastern bird," as is sometimes done.

The nomenclature employed in this volume is, in the main, that announced by Mr. Ridgway in his important paper on the nomenclature of North American birds, published in 1881, but here and there we note changes from that list. Thus, we find the so-called English snipe no longer called *Gallinago media wilsoni*, but see that it has been restored to specific rank, and that what we formerly thought of as *Gallinago media* has, as was predicted would be the case in Dr. Leonhard Stejneger's paper on the subject (Proceedings U. S. Nat. Mus., Vol. V., 1882), taken Frenzel's name, *Gallinago cœlestis*.

In this volume we have set before us, for the first time in an American work on ornithology, full and systematic descriptions of a number of extralimital species, of which one or two individuals have recently been taken within our borders, a fact for which those ornithologists who have not access to large libraries will be profoundly grateful.

The present volume and the one which is to follow it will be gladly received by sportsmen generally as well as by naturalists. The former will find in it so many of the species which they pursue, that the work is certainly one which should be in the hands of all our readers, who cannot fail to find in it pleasure as well as profit.

Taken as a whole the work is monumental; its value and its importance can scarcely be overestimated. Praise is not needed for it, since the names of its authors are a sufficient guarantee of the quality of the work, and to say that it is by Baird, Brewer & Ridgway, assisted by Allen, is only another way of stating that the very best minds among the ornithologists of this country have combined to produce a work which shall do them credit.

* The | Water Birds | of North America, | by S. T. Baird, T. M. Brewer | and | R. Ridgway. | Issued in continuation of the | Publications of the Geological Survey of California. | J. D. Whitney, State Geologist. | Volume I. | Boston: | Little, Brown and Company. | 1884. | Price (uncolored) $12 per volume. Hand colored $30 per volume.

SEASONS AND BIRDS OF THE PRAIRIE.

BY H. S. WILLIAMS, M.D.

WHEN old Boreas bursts through the sun-bound confines of his summer home and comes rushing southward, driving the more tender birds to warmer climes, there are a few species which, more hardy than their followers, fear not the threats of the bluff old gentleman, but remain to buffet with him. Latest among the little wanderers that come rushing from the north with the first blasts of winter, are the longspurs (*Centrophanes lapponicus*) and snow buntings (*Plectrophanes nivalis*). Hardier birds than these there are none; the more boisterous the weather the better pleased they seem. Winter kings the country folks call them, and truly they deserve the name. They are almost the only birds that come regularly about the prairie barnyards in the winter. The two species associate together to a considerable extent, but the longspurs seem more adundant and familiar. Seen at his best, the longspur is by no means a plain bird, but at no time will he bear a companion with the snowflake. The latter is indeed a jaunty fellow. How finely contrasted are the black and white of his wings, and what a warm brown hood he wears. Seen hurrying over the prairies, he is, with the exception of the snowy owl, the most noticeable bird of winter. But I fear his fine feathers make him vain, for he is something of an aristocrat, holding himself rather aloof from the society of man during fine weather, or so long as he can obtain food elsewhere. But during severe storms he sometimes comes familiarly about the stables in quest of food. This has led to the belief, common in some districts, that the appearance of the "white snowbird" predicts a storm, while the coming of the "black snowbird" indicates the approach of fair weather. This last is not necessarily the true *hyemalis*, which rarely remains in Northern Iowa during the winter, but any of our darker winter birds. Many persons go on a step further and gravely assert that the same individuals actually change color from day to day, becoming white before a storm!

Another strictly terrestrial bird, only less hardy than the last, is the shore lark (*Eremophila alpestris*). He is a resident here, yet somewhat erratic in habits as in flight. I am not surprised if I see him in the depth of the coldest winter, but then he appears only occasionally; and quite as frequently he is not seen at all during two or three of the coldest months. Some fine February morning, however, as I walk across a meadow or ploughed field in the open country, he starts up before me, and then, as he flies away, he sings. His notes are sweet, but so fine and feeble that you must listen intently or the breeze will bear them from you and they will be lost. The bird may have remained here all winter, but more probably he has just returned from a pleasure trip somewhat further south. At all events he has not sung before, and I herald the note as truly a spring sound. True, spring will not open for a month to come; we shall not see the bluebird, borne in the same breeze that brings the first whiff of that orange-blossom aroma which all await so impatiently, for several weeks; but the lark's song reminds us that nature is awakening. It gives us a foretaste of what may not come in reality for a long time. No matter what the weather may be after this, I see the lark daily. If it storms, he utters only a shrill *cheep*; but if it shine he is full of music. Seated on the ground or upon a fence post, he sings almost constantly. First comes an interrupted prelude, more faint even than the song itself, which is a peculiarly undulating sucession of lisping sounds, sweet, and at times penetrating. But this is by no means his best performance, though his song is always the same. Later, while his mate broods her eggs on the ground below, he pours forth his music from the skies, as becomes a lark. His ascent is songless; obliquely, by successive stages he rises, alternately beating a few strokes with those strong wings and gliding with pinions motionless. But having reached the height to which he aspires, his song begins. As he sings, he floats motionless, slowly sinking. The strain ended, a few wing-beats brings him again to the desired height, and again his feeble liquid notes are heard. He is so high that he seems a mere speck against the sky, yet, feeble as are his notes, we hear them distinctly. We must not take our eyes from him or he may be lost, and we shall miss the best part of the performance. Having repeated the strain a score or more times, he pauses for a moment in air, gives a swoop downward, and then, closing his wings, falls like a thing inanimate, rushing earthward with almost meteoric rapidity. Surely he will be dashed in pieces; he goes to his own destruction and no power can save him. But no; when almost to the earth, see him spread those broad wings, swing outward and upward in a graceful curve, and go skimming off across the meadow. What a grand finale! one exclaims involuntarily, and ever afterward we regard the lark with a new interest and class him among the true avian poets.

I have said that the lark is erratic in habit, but he is by no means as much so as a certain hardy little northerner who is not so exclusively confined to the prairie, yet is never with us found far from the open country. I refer to the redpoll linnet (*Ægiothus linaria*). This little fellow is sometimes abundant throughout the winter, sometimes seen only in fall and spring, again is not observed at all during the season. The winter of 1878–9, remarkable for the large number of northern birds it brought to us, gave us among the others numerous redpolls. In the fall I found them in the open prairie, and later they came about the yards in town, associating with the goldfinches, which they resemble in size, in flight, and in one of their call notes. I know a sandy plot by the river, covered with weeds, where these birds could almost always be found, and there, too, perched on the topmost bough of a neighboring tree, might be seen the marauding shrike (*Lanius borealis*), which ever and anon darted with murderous onslaught into the ranks of the finches and, selecting a victim, followed it in hot pursuit through the air. Now up, now down, to this side and to that, darts the affrighted bird, and close behind, following each deviation with the unerring accuracy of a sleuth hound, comes the blood-thirsty pursuer. Who would not, as he sees the exertions of the little finch become less and less powerful, put an end to the flight of the ruthless shrike? Gladly would we cut him down and tell ourselves that we but gave him his deserts. Yet he only pursues the dictates of his nature; he kills that he may live; and we who condemn him would pursue as eagerly a rare finch or warbler and shoot it, almost without a throb of compunction, merely that we might dissect and classify, or, giving it a wire skeleton, perch it in life-like attitude, mocking its once happy actions. But we think not of this as we see the frightened finch almost within the clutches of the shrike. We only wish that we might destroy the pursuer. But it is too late; they have passed in zig-zag flight, the shrike every moment closing in upon his prey. At last he makes an extra exertion, and the victim is his. Seized in his bill he bears it sloping to the earth, there to perform the closing scene of the little tragedy.

In glancing at the character of the shrike, I find much to admire. Though small in size, his superior strength and activity more than make up for this deficiency, and few, if any, are the birds to which he yields in open combat. In point of sportsmanship, what one of our hawks is his equal, though he be armed only half as well as they? The little falcons are almost unerring marksmen, but they are pot-hunters. Failing to secure their victim at one sudden sweep, they leave it and go in search of another standing mark. Not so the shrike. True, he sometimes "pots" a bird; I am not certain that he would not always do so of a preference; but, failing in this, he gives chase, like a true sportsmen, and the victory is given to the swifter pair of wings.

The northern shrike, to which reference is here made, visits us only during the winter. His congener, the loggerhead (*Lanius ludovicianus*), is a regular and rather common summer resident, found only in the open country, and nesting in hedges or groves of cottonwood. I have not known him to exercise his sportsmanship upon anything larger than a grasshopper, and think he confines himself largely, if not exclusively, to insectorial prey.

One can scarcely speak of prairie birds and say nothing of the king of them all—the pinnated grouse—though he has been so often and so well described that every one is familiar with at least the outlines of his history. With us, as elsewhere, he is termed a resident, yet I doubt whether many individuals spend the entire year in one latitude. Each fall large flights of grouse pass over the towns, always headed toward the southeast, and in the spring a corresponding number all northwest bound. These flights occur mainly at dusk and in the early morning. The birds fly in scattered companies, as low as barely to miss the tops of the trees and houses; the shrill whizzing of their wings tells of their proximity before they are seen, and a view of them gives one a conception of momentum which, it seems to me, could be made more vivid by nothing less than a cannon ball. At no other season are the grouse seen to make extended flights, and in spring and fall, as already mentioned, all move in one direction, northwest and southeast, respectively. This would seem to be sufficient proof that, with us at any rate, individuals of this species are migratory, though collectively they are certainly resident, being as abundant during the most severe winter as at any other season, and, of course, far more conspicuous, there being nothing to afford a hiding place. They begin to "pack" early in the winter, and sometimes associate in immense flocks, numbering in some rare cases many thousands. This happens only when there are very large fields of unhusked corn in a particular section, affording peculiarly favorable conditions for the existence of a large number together. Under such circumstances I once saw a flock of grouse which, when on the wing, extended continuously for a distance of fully half a mile, the stream—for such it seemed—being perhaps fifty yards wide and three or four tiers deep; this entire space, be it understood, as closely packed as ample wing-room would permit. Such flocks as this are very unusual, but two or three hundred individuals are frequently associated together. Outlined against the snowy sheet that covers the prairie, they are very conspicuous and afford a great temptation to the sportsman; but they are so wary that it is almost useless to stalk them on foot, except during a storm. In a sled one can often approach within fair range; but he who would at down right and left now must be no novice, for the grouse is no longer the weakling that we knew in August. At best, only small bags are possible, and no one here thinks of doing much grouse shooting after the fall "packing" begins.

To the Eastern man, traveling over our beautiful summer prairies, it is a matter for constant wonder that no grouse are seen, even though he is assured that he is in the midst of their haunts. From May till October one may ride constantly through a country where grouse abound without catching more than an occasional glimpse of an anxious hen skulking with her brood by the roadside. Even if actual search be made, it is a mere chance if it be successful; and we might as well hunt a fox without hounds as to hope to make a bag of grouse in the early fall without the assistance of a dog. It is much to be regretted that the grouse are yearly becoming less abundant in Iowa; but as we have a pretty generally observed game law, it will be many years before anything like complete extermination is threatened them, even in the eastern part of the State. The gradual and steady decrease in their numbers is, of course, attributed to the sportsman; but there is a cause over which man has no control that operates more efficiently than any other in deciding the relative abundance of grouse in any particular season, viz., the June freshet. If the backwardness of the season has prevented the grouse from mating early, and in addition the succession of June storms that we almost always experience begins early, large numbers of the chicks are drowned; and it may safely be predicted that small "coveys" will be the rule in the fall. Occasionally an entire brood is destroyed, in which case the mother bird again undertakes the maternal duties; and when the "season" opens in the fall, her chicks will be no larger than half-grown quails and barely able to make a feeble flight of a hundred yards.

But I have given more space than I intended to the grouse, and will only mention a few other common winter residents that help to add interest to the dreary aspect of the prairie landscape during the season. The most conspicuous of these is the snowy owl, which is a regular, though not a very common resident. The short-cared owl (*Asio accipitrinus*) is more common, and is, furthermore, a resident, nesting in May or June on the ground among the grass in the open, unbroken prairie. The same remark will apply to the marsh hawk (*Circus hudsonius*), but these latter are more abundant during the summer, and are, no doubt, partially migratory. The marsh hawk is apparently a feebly organized bird, well fitted to prey upon small birds, frogs, etc., but he is capable, when pressed by hunger, of much greater feats. I once witnessed a most exciting chase, in which one of these birds was the pursuer, and the pursued no less a bird than a full-grown

pinnated grouse. The latter flew with all the swiftness of which fear rendered it capable, yet the hawk, with apparent ease, flapping those broad wings steadily but in a leisurely manner, followed close behind, gradually shortening the distance that separated him from his victim. For more than a mile the race continued, and at last, the grouse, overcome by either fatigue or fear, came to the ground, and the hawk followed immediately. They were by this time so distant that I could not see the final result, but I had little doubt that the quarry proved an easy victim and served for many a fine repast. I had not previously credited the hawk with so much courage, and I think his prowess is not generally appreciated.

With the first approach of spring, not the "ethereal mildness" of the past, but the stormy, disagreeable early spring of practical life, the prairie takes a still more uninviting appearance. There was something grand, almost sublime, in the vast, unbroken, dazzling whiteness of the typical winter landscape, but this now gives place to a dirty, dismal, muddy expanse, which calls forth neither the sadly-pleasant reveries of autumn nor the joyful vivacity of the late spring time. The snow melts and stands in pools in the level prairie, and swells the "sloughs" and little ponds of the more rolling country into vast shallow sluggish rivers, and cold, dark, silent lakes. Even the birds seem to have left for more pleasant scenes, and for a few days a fertile soil has the dreary visage of a desert.

But in a day all is changed. What seemed the fit abode of death now teems with life. Ducks of a dozen species throng the ponds, and geese, brant, and cranes stalk about on the higher grounds. Pintails and mallards, in flocks of hundreds or even thousands, visit the last year's corn and oat fields, literally blackening the ground as they feed and the air as they rise. An occasional blue heron (*Ardea herodias*) flies silently over the water courses, the brown bittern skulks among the slough grass and dwarfed willows, the Wilson snipe springs in erratic flight on every side, and the shrill whistle of the curlew breaks anon upon the almost audible silence that yesterday pervaded the very atmosphere.

All this is but a transition scene, in a few weeks these welcome visitors have retired to their summer haunts, but in their places there are others who are not visitors merely, but residents come to spend the entire summer. And how different is the face with which nature greets them from that which of late she wore. All now is smiles and gladness. The ponds and sloughs have returned to their wonted limits, the upland is dry and its coat of dusky brown has given place to one of loveliest green, sprinkled here and there with golden buttercups and subdued by the exquisite purple of the pasque flowers and violets. Now, indeed, does the face of nature smile as one who wakes gladly from a peaceful sleep. Her creatures of the prairie, though less varied in kind than those of the woodland, are sufficiently abundant to lend animation to the enchanting scene. Spermophiles, our most typical prairie mammals, whisk gayly here and there, or viewing us suspiciously from their door-sill, prepare to dive into the bowels of the earth at our nearer approach. Little sparrows, most conspicuous among which is the yellow-winged, make the air vibrate with their ditty, while the ubiquitous black-throat buntings chant their clinking strain on every side.

And there, stalking so gracefully, with that slender neck responding to each motion of the body, or floating along with broad wings tremulously vibrating in a manner that marks him unmistakably, is our most characteristic upland bird of summer, the Bartramian tattler. A little shy and reserved he was at first, but now the very embodiment of confiding trust, and at all times a model of gentle gracefulness and meekness. Knowing the characteristics of the family to which he belongs, and watching him individually, one would not suspect him of having any other notes than the melodious, undulating chuckle which he usually utters as he takes wing. But he has others, nevertheless, and his song—for such it really deserves to be called—is the wildest, shrillest sound to be heard on the prairies. It is not like a bird note, and, in fact, I think of nothing in nature which it resembles save the shrieking of a gale; and a poet, not seeing the bird, would doubtless attribute the sound to the prairie wind sporting among the clouds, for the tattler gives birth to his thrilling strain only while suspended high in air. A corruption of the sound may be brought to the mind of one who has never heard it by whistling shrilly an imitation of the sounds "*wheep-cheer wyl,*" the first two syllables being very much prolonged. Beginning low in the scale, a gradual ascent is made till a very high tone is reached, which is caught up by the second syllable and the scale descended to the point of commencement. These notes, like the boomings of the grouse, are heard as distinctly, and seem as loud, at a great distance as when near at hand; but such is not the case with a low, chuckling prelude which invariably precedes them but is often lost in the air. The tattler's return to earth, when he has tired of repeating his wild strain, reminds one of that of the shore lark, already described; but it is a little less bold and not absolutely perpendicular, the wings being partly unfolded.

We would gladly bid time pause at this season that we might longer revel in the luxuriance of its pleasures; but it cannot be. Spring shades gradually but all too quickly into early summer, and the vivacity of Nature gives place to a dreamy somnolence. Even the birds are listless and forget to sing, save the ever present black-throat bunting, whose chant, breaking in upon the drowsy stillness, becomes monotonous from frequent repetition. The vegetation is assuming something of a parched and withered hue, in keeping with the golden sheen of the harvest fields. The sun's rays fall with constantly increasing force. There is no shelter, and often for a whole day not a hand's breadth of cloud dots the clear azure above. What wonder that the birds are silent? And yet, but for the heat, what surroundings could be more in harmony with poetic inspirations? An expanse of grass sprinkled with golden rods and asters, bounded only by the over-arching sky; absolute silence, broken only by the hum of insects, an all-pervading sense of vastness, of silent grandeur, of sublime peacefulness—surely no spot, unless it be the deep, primeval forest, could better engender a feeling of contentment and rest, an appreciation of the force of a dreamy, idealistic philosophy.

But the summer days are also sped, and sadly, yet not without pleasure of a somber kind, we note that the year is dying. Our prairie now of itself has few charms; but the stir and bustle among it inhabitants afford new scenes each day for the observant eye. The more tender birds move off to the south, and each day some new migrant appears from the north to tarry for a few days or weeks before again taking up its journey. The warm showers have been succeeded by chilling rains; the gentle breezes by cold, cutting winds; frosts nip the vegetation and crust the ponds at night, though the sun still gives at midday resuscitating warmth. The wildfowl appear again and animate the prairie as in the spring time. A season of calm succeeds—the Indian summer—that smoky, quiet season when all is serene and peaceful, yet all suggestive of death, dreary, a change. And the change is at hand. A sharper frost kills the last hardy stems, and puts upon the water a coat that the wildfowl cannot break; the chilly blast whistles unchecked across the prairie, bringing the first scurrying snowflakes; the last goose honks his farewell for the season, and the stillness of the night of winter settles over the scene.

CHARLES CITY, Iowa.

THE COUESIAN PERIOD.

Editor Forest and Stream:

The letter in your issue of the 12th inst., addressed to the Chairman Section of Avian Anatomy, A. O. U., and signed by "*Amicus Socrates, amicus Plato, magis amica veritas,*" has just been read by me. I beg leave to say to your correspondent that notwithstanding the fact that he informs me that he is a member of the Union, this is no reason, nor can he expect it, that I am called upon to answer an anonymous letter. It is something I have never been guilty of, and I do not intend to depart from my views upon such matters in the present instance. I am prompted in writing this letter simply by the fact that I do not wish your correspondent to think me so discourteous as not to take any cognizance of his communication whatever, or much less that he has written something that is unanswerable. So soon as he does me this honor, and is manly enough to attach his proper name to his views, it will give me pleasure to respond to him and answer his questions to the best of my ability. I am too old an ornithologist, to say nothing of my experience in kindred matters, to be caught "gunning in the dark."

R. W. SHUFELDT.

WASHINGTON, June 13, 1884.

RODENTS AS CARNIVORES.

MY acquaintance with the muskrat has been intimate for some time. In the winter of 1822-3 I saw a dead horse thrown down the river bank against some trees. The muskrats had a beaten path in the snow from a hole in the bank, some twenty feet distant, to the carcass, on which they fed half the winter. The inference is, then, a fair one, that they would gladly have added variety to their diet by fishing, if circumstances favored, and this is certainly strengthened by the fact that, in March of the present year, a man, fishing through the ice for pickerel, after a hard tussel with "a big one," drew out a muskrat on his hook. The skill of this animal in opening bivalves is proverbial, and yet he is often driven to straits for food in winter, as he does not hibernate. I once caught one burrowing under the snow, like a mouse or mole, gnawing grass roots from the frozen ground.

But this is not the only rodent that has outraged "classification," and eaten forbidden fruit. During my sojourn among the mountains the past summer, a young woodchuck fell into our hands, and was in many respects a petted favorite. My brother had already paid $5 bounty on dead ones, to save his clover fields from damage, but here was an innocent prisoner, and of course he was not killed but fed.

All through July, August and September, he was at meal times "a regular boarder," pulling at my clothing until supplied. Bread, milk and cooked potatoes constituted his favorite diet, and he manifested a decided preference for cake. For this food he abandoned clover entirely.

In October he dug a hole and foraged promiscuously upon any light cotton or muslin fabric for a nest. I found him dragging a large pillow into his hole, and stopped the business by placing armsful of rowen hay at the entrance. This soon disappeared, and his visits to the table were less frequent. Early in November he closed the blinds, pulled down the curtains, and we saw him no more.

Late in March of the present year, he came out in fair condition, resuming at once his place in the household and demanding the rations of the former year. One day we passed him sitting bolt upright holding half a sucker in his hands, just caught. He was biting off large pieces and eating with all the seeming relish of an otter. Soon the season of family arrangements came on, and he left for a mate, perhaps to return, but most likely to meet his death at a stranger hand.

Nor is the squirrel family, preëminently "nut crackers," exempt from the same charge. I once set one at liberty in my laboratory to play hide and seek among boxes and specimens, but his partiality for bird meat, and ignorance of the physical effects of arsenic soon cost him his life.

SPRINGFIELD, Mass.

FISH AND SNAKES.

THE writer, who has fished more or less each season for many years, has long been aware of this habit of snakes taking fish, and after careful observation I am firmly convinced that fish furnish a great source of diet to a large portion of the snake family.

On Saturday last, the writer with a companion was fishing for pickerel in the outlet of a pond near this city, and while thus engaged we were treated to a very remarkable exhibition of this habit among snakes. As our boat was slowly paddled along the shore among the lily pads, the writer, who wielded the rod, noticed a large striped perch alarmed at our approach, dart into a small cove, and the next instant there followed a great commotion in the water. As our boat was moved slightly so as to obtain a better view, we saw a large snake holding the struggling perch in its mouth above the water and making its way slowly to the shore. Scarcely had it reached the bank with its victim when there rushed from some hidden retreat among the bushes another snake at least a foot longer than the other, and instantly a terrible struggle took place between them for the fish. Over each other they rolled and writhed upon the ground. One instant both would be tugging at the fish, then the fish would lie upon the ground, and over his struggling form the snakes would roll in battle in a desperate struggle for the mastery. At last by a mighty effort the larger beat off the smaller, seized the fish in its mouth and glided into the water, whereupon the smaller became the attacking party and another terrible struggle took place in the water. At last, as though becoming tired of the unequal combat, the smaller one disengaged itself from the fray, and with a slow, tired motion, swam slowly ashore among the bushes. The other, holding his ill-gotten prey aloft, at least a foot above the water, went quickly ashore.

It was now time for us to show our hand, and picking up a stone each (for we had previously landed so as to better view the fight) we cast them at his snakeship, and he was soon dead.

The perch was a fine specimen, eight inches in length, was in good condition, gills bright red, and had the luster in appearance that denoted a healthy condition; it was quite exhausted by the rough treatment and from being out of the water so long, but after we returned it to the stream, after a few erratic movements it slowly swam out into deeper water.

The snakes were both bluish black in color on back and sides, belly was a deep bloody orange color, and the one we killed was four feet and ten inches in length. HEMLOCK.

LOWELL, Mass.

[These snakes were no doubt the common black water-snake (*Tropidonatus sipidon*).]

BOUND TO RAISE A FAMILY.—Early in May a pair of robins built their nest in a cedar tree close to my bedroom window and soon three eggs were laid. Men working at a fence close by disturbed the birds and they shifted their home into the branches of an elderberry bush twenty yards away. A week after their removal I observed an English sparrow in the old nest, throwing out an egg, and in a few days more they had all disappeared. When their second batch of eggs was partly incubated the proverbial bad boy "poked" the nest down, to the utter dismay of the mother robin. Nothing daunted, however, the couple seem bent on raising a family, and have again taken possession of their first quarters. This morning I noticed two eggs in their nest. A pair of robins have brought out two broods each year in this same cedar tree, the last two seasons, and I am inclined to think that this couple are my former visitors.—POST (Yonkers, N. Y., June 14).

LATE GOOSE.—Saw a wild goose fly in a northwesterly direction toward evening on the 8th inst. This is the latest straggler I have ever observed.—POST (Yonkers, N. Y., June 12).

Game Bag and Gun.

THE WHITE DEER.

AN INDIAN LEGEND.

A PHANTOM there is in the far Northwest
A shade of a deer that flees forever:
It never stops and 'tis never at rest,
But onward it speeds over mountain and river:

From the blue Coast Range to Sierras' heights,
Through the forests deep and by intricate ways;
On the stormiest days, in the darkest nights,
'Neath the sultriest suns of the summer's blaze:

From Shasta's base to his dome of snow,
Around Lassen's zone and a hundred lakes—
Where thundering torrents incessantly flow,
And nothing may follow the course it takes.

The dogs start up from the hunter's fire,
And madly spring to a midnight chase:
They baffled return after venting their ire,
In baying the phantom that vanished in space.

The hunter halts, where he steals along—
And his rifle flames at a bounding deer—
At a mighty stag with many a prong,
He fires again—and he shakes with fear;

For the deer bounds on with never a wound,
Though the mark was fair and the aim was true,
And its heavy weight fairly shook the ground,
As with miraculous leaps it evanished from view.

The phantom will be when the men are gone,
For 'twill never be slain by a mortal's might,
And onward 'twill speed, forever on,
The deer is a spirit and snowy white. ESAU.

SHASTA, Cal.

A SUNDAY DEER.

BY D. D. BANTA.

SEVEN years ago last summer I made my first visit to the Twin Lakes in Montmorency county, Michigan. With my two boys, then mere lads, and a young preacher fresh from Princeton, I had been on the Au Sable a couple of weeks or so, having all the sport with the grayling of which I was at the time capable. How often in memory do I recur to those red-letter days! The Au Sable was populous with a fish that has afforded me more real pleasure in the taking than any other fish I ever met with. And besides that, the navigation of the Au Sable in the summer weather, was replete with every fluviatile enjoyment. The crooked, winding, spring cold waters, now dashing impetuously down the Huron slope beneath arboreal arches and between forest-fringed banks, and anon widening out into a broad, deep, sluggish stream, with low banks, whose timber was burned and blackened by former fires, presented a succession of pictures that never failed to charm even those least loving the wilderness. I have made eight voyages down that river in as many years, and as I sit by my coal fire and look out of the window at the fleecy flakes of this March snowstorm, I hear in fancy the rippling of the Au Sable's stream, and I know that a brown hackle dropped lightly upon the surface of yonder dark pool, beneath the overhanging cedars, will be followed by a splash that will tingle every nerve of my body, and I want to make the journey once more.

Ball had quite recently built a cabin on the river about seven miles below the north branch—the only occupied cabin for forty miles up and down the river—and he was loud in his praise of the Twin Lake region as a profitable place to go for hunting and fishing. Of both we could have a surfeit by sticking to the river, but "Man never is, but always to, be blest," and so we listened with sharpened ears to the glowing stories told of the Twin Lake country. Ball had never been there himself, nor had Pancake Jack, a trapper staying at his cabin, but both had talked with land-lookers and trappers who had, and it was made manifest to us that the sportsman's paradise lay at the Twin Lakes.

The map showed that it was twelve miles to the lakes in a straight line; how far in a crooked one it remained for us to find out. A hay road had been cut out half the distance, and both Ball and Pancake thought we would strike the plains shortly after passing the end of the road, and so have unobstructed traveling most of the way.

Bob Greaves, a Canadian, who had drifted out to Roscommon and was able to own a wagon and team, happening in,

we engaged him to tote us out, and so, on a drizzly, uncomfortable August morning, with Pancake as guide, we set out for the Twin Lakes.

I need not stop to tell what a rough time we had of it after we had gone as far as the road was cut out. I have been in my share of tight places by "flood and by field" rambling in the wilderness, but for twelve hours I am quite sure I never exerted myself so continuously as I did on this trip, chopping and bridging in order to get through a swamp that intercepted our progress. As the sun was going down on the second day, we emerged from the swamp to the plain, and were so exhausted with toil that we built a fire and slept, with the starry sky as our tent. By noon of the third day we reached our destination.

The Twin Lake region is famous for the number of its lakes and the beauty of some. It is so named because of the two largest, which lie very close to each other, and are called the Twins. "There are a hundred lakes," said Ball, "in one township up there," which is perhaps an exaggeration, but there are a great many lakes, mostly land-locked, lying on the plateau between the headwaters of the Thunder Bay River, which flows eastward into Thunder Bay on Lake Huron, and Black River, flowing northward into the lake, and Big Creek, flowing westward into the north branch of the Au Sable. The Twins and Wolf Lakes and Te Lake are of sufficient importance to give good sport. There may be others, but if so I never found them. The ponds and smaller lakes are too numerous to mention.

The first lake we came to was Te Lake, so called because some early trapper or land-looker fancied he saw in its shape a resemblance to the Roman capital of that name, and could not let the opportunity pass to show his learning. The lake does bear a rough resemblance to a T, but it would make a better boot than T. It is true that the heel would be a little long for a normal Caucasian foot; but, if we call it a boot, when I tell you that the leg lies north and south, with the top to the north, and the foot east and west, with the long heel pointing west toward the upper or eastern Twin Lake, which is surrounded by a heavy forest and which is about three-fourths of a mile distant, and the toe pointed eastward toward a cluster of small landlocked lakes lying in the open, brush-covered plain, some of which are crescent-shaped and others circular, and others still irregular in outline, and that our camp was established in a grove of beautiful Norways that fringed the sole from toe to heel, and that we were a third of the distance from toe to heel, I think you can find our old camping ground, should you ever visit the lake, much more readily than if I were to describe it by the letter it is supposed to resemble. South of our camp spread the open plain, dry and free from mosquitoes and no-see-ems, and north of us, across the foot, was a brushy plain, also of dry land. We were free from insects. Our teamster returned to the settlement at once, and Pancake Jack, after a vain effort to kill a deer, soon followed after.

By some mischance we failed to take with us an adequate supply of flour—a mischance that oftener happens to a camp than any other, according to my experience. We did not make the discovery, however, until both teamster and trapper were gone, and as the teamster would reurn to Roscommon, thirty or forty miles distant, and remain there until his appointed time to come after us, we saw that there was but one thing to do and that was, eke out our flour so as to give us some bread at every meal till his return. If he came at the time appointed, we found by actual measurement that we had a little less than three pints of flour per day for four mouths, and whatever may be the fact at home, that ratio will not begin to do in the woods. We had, however, a good supply of tea, coffee and sugar, a little meal, some rice and a few potatoes, and the woods were full of huckleberries, while the lake abounded in bass. Fortunately we had with us a boat, and Te Lake produced bass running from one and a half to three pounds. Near the instep of our boot-shaped lake were two islands. One of these, containing about an acre, rose eight feet or more above the surface of the lake and was covered by a forest of white pines and other soft woods, which was the only pine forest I ever saw in the Lower Peninsula, not showing any marks of fire. Not a charred stick, stump, trunk or log was to be seen on that island. Around its shore was the best bass fishing I think I ever saw. Two seasons, that one and the following, I fished off the north and east shores of this island with amazing success. And while I am at it I may just as well say that while I never fished in either of the Twin lakes, nor in Wolf Lake, which lies a half mile or more north of the east end of the easternmost Twin Lake, yet both Ball and Jack told me the following year and after they had fished them that all these gave capital sport. These lakes are accessible from Gaylord and Otsego on the Saginaw and Mackinaw Railroad, and the sportsman who will take his boat with him and set up his tent on the east shore of the easternmost or Upper Twin Lake will be in one of the most delightful tenting grounds I ever saw. He will lack but one thing, and that is a spring of good water. But the lake water is sweet and clear, and if he understands himself the water question will never vex him. The spring is at the west end, not far from the outlet.

Notwithstanding Pancake Jack, who never scaled but skinned his bass, could fry one better than any woods-cook I ever saw, and for that matter house-cook either, and imparted to us something of his skill before he left us, yet we soon began to "lust after the flesh pots of Egypt." My experience deer hunting was quite limited, and contrary to what I had expected, all the deer I came across were too smart for me, and I came across a good many. To save me I could not kill a venison.

We had nearly stayed our two weeks. The weather had been delightful. Nearly every day the sun had sifted its yellow rays down through the waving Norway foliage upon our camp grounds. The Chaplain, as we termed the young preacher, had fished some, hunted a little, read his Greek Testament more and slept most. The boys had picked huckleberries, kept camp and rioted in all the joy of spirits that our vagabond life in the woods gave. As for me, I explored woods and plains for lakes and ponds, and at the same time thought I was hunting. Well, so I was, and I found some deer, too, but not until they had first found me, and then all they would show me was a flag of truce. It was peace between us in spite of all I could do. At first I think my companions had confided in my skill as a hunter. They had seen me shoot one or two deer on the river. But as the descending suns had continued to bring me back to camp without the coveted venison, they ceased to talk about it as a thing within the range of our possibilities, or even to ask me the stereotyped "What luck?" The last Saturday had come and gone, and I had cleaned my rifle and laid it aside. Monday was the appointed day for Bob to return for us, and as our flour was nearly gone we resolved to eat fish for Sunday's breakfast, dinner and supper, and bake the last bread Monday morning, for go out to Ball's we would on that day, Bob or no Bob.

Sunday came bright and breezy. This was our day of rest, and as for me I was wearied enough with my much tramping during the week just closed to thoroughly enjoy it. Amid much merriment, with not a few jibes at my skill as a hunter, we had eaten our dinner with its small supply of bread, after which the Chaplain took his Greek Testament and retired to a shady spot to read, meditate and, perhaps, sleep. The boys having rigged a blanket for a sail to the boat had gone sailing on the lake. I was at our improvised table writing in my camp journal. I think it must have been about 3 o'clock when it occurred to me that I had not heard any noise from the boys for some time. At once I walked to the lake's margin and looking westward saw the boat sailing homeward with but one sailor aboard. At once it flashed across across my mind that George, the "unlucky boy," had fallen overboard, and with that I desperately called for tidings, as if I could have made myself heard the distance Charley was away. But ere I had time to catch the answer I hoped for, I saw through the open Norways the "unlucky boy" running toward me as if in a race, and at the same time motioning for silence. Very soon he came up puffing, and in an awful stage whisper he exclaimed, "Deer in the lake!" and at the same time pointed to the east. Quicker than I can write it I had "old Smiley" out of the tent—and a large-bored, hard-shooting rifle she was—and with powder and ball rammed home set out for my game, that was from a quarter to a half mile away.

Well up toward the toe of the boot on the south shore was a bit of rather low land—an acre perhaps—and it was covered by a thick growth of tall, slender Norway saplings. Into this clump of small trees I crept, and at about seventy-five yards from the lake's margin I stopped to reconnoiter. All George had said was, "deer in the lake." Where was it? I could see the shore at the very end of the lake and clear around on the further side, but no deer was there. Had it scented me from afar and fled as all the others of weeks before? Or, is that red fringe I see through the brush at the edge of the water just in front of me it? No. I came very near shooting at just such a fringe Saturday morning, and it turned out to be a bunch of red blossoms. Hold! It moves, I believe. Ah! To be sure it moves—that's the deer. Heart, be still! It is feeding on the lily pads, and I must wait till it puts its nose to the pads again. There! I creep to a sapling, for somehow I find I am not over steady of nerve just now, and I must have a rest. It is a bushy place to shoot through, but I fancy I can hit that red line. Drawing as fine a sight as I can, I pull trigger, and as the report dies away, I hear a splash or two and then all is still. Did I kill it? Without the knowledge experience brings, I did not understand the significance of the splashing. Hastily re-loading, I ran around to the end of the lake and there I fancied I found blood, but a second look told me it was a bit of red moss. Examining the shore with some care, I could not find the place where I could feel certain it had left the lake. So many tracks were there, I became confused and despondent. After all, had I missed the thing clear? Dear me! The gun must surely shoot wild. I parted the fringe of brush and weeds at the margin and look over into the water. Strange I had not thought of doing so before, for there is the track of muddy water leading right to the very place I am standing. Here then, the deer must have come out after all, and I step back to look once more for the track, but failing to find it, I return to the margin once more, and parting the fringe of bushes and weeds, I examine carefully to see, if possible, the animal's track. And as I do so, the clearing water discloses my deer lying four feet beneath the surface, dead of course, and at once I leap in and haul it ashore.

"Whoo-ee!" It is a shout of victory. Three answering shouts come back to me, and quicker than I had thought, I hear the cracking of brush and the scraping over logs, and above all, the heavy slump, slump, of the Chaplain's terrible boots. The good man had dropped his Greek Testament and was bound to be in at the death. No sooner did he get sight of me than he asked:

"Did you kill it?"

"Yes!"

"Good for you!"

And next George's bare head popped up over the crest of a little hill.

"Have you got it?"

"Yes!"

"Bully!"

Our quarry proved to be a young and barren doe in fine condition, and was at once taken to camp, where all hands turned to and it was soon flayed. Then we began to talk for the first time of our hunger. Till then each had eaten his share to the last crumb and said nothing. But now we began to complain. The Chaplain said he was "awful hungry—hungry enough to eat a piece of dead deer," and I told them that we would cut the big bones out and crack them and boil them as the primitive man was supposed to have done. And we did. And besides the cracked bones we put in the pot all the nice tid-bits, and then covered all with water and clapped on the lid and set the mess to simmering and stewing over a slow fire. After an hour had passed, the Chaplain's irony became as sharp as his appetite, and he proposed that we go home and leave the pot till next year; and so to appease him our last potatoes were sliced and put in, and when these were cooked till done and some seasoning had been put in, we stirred water into a fourth of a pint of our precious flour till it was the consistency of thin cream. That we poured into the pot, which was boiled briskly as long as we could abide it, when the dish was pronounced done, and a more palatable, savory, satisfactory dish, not one of us ever tasted, I am sure.

The next day Bob Greaves came after us and in due time we were back upon the swiftly flowing Au Sable catching grayling.

MARCH, 1884.

THE TRAPPERS.—Hornellsville, N. Y.—I hardly think that you will hear much from the trappers. They are not likely to write much about their art, for those who excel in it do not care to tell what they know. Their secrets are jealously guarded. But on other points you might occasionally draw them out, on the improvement in traps, for instance. I should like to know where foxes are plenty, so that I can trap them.—S. D. [Foxes are plenty in Accomack county, Virginia.]

GAME IN MARKET.—The New York *Graphic* of June 13, says: "If our correspondent will take the trouble to go through the markets he will not find it a very difficult matter to obtain a brace of wild ducks or some choice cuts of venison, even if it is the close season. Of course, the game laws are evaded. Everybody knows that."

SNIPE.—The jacksnipe is a migratory bird, and, having attained on the southern marshes that succulent obesity which is so highly prized by the epicure, he takes his way north to relieve the aristocratic canvasback and the conservative redhead of their involuntary martyrdom in the Chesapeake Bay. The snipe is known as the grayback, English or jacksnipe. He goes to marshy or boggy ground. His food is obtained from the mud, into which his long bill is thrust. He is a real game bird, with an erratic flight and an accommodating tameness. He does not become alarmed and fly up at fifty yards' range, but he prods around in the soft ground with perfect unconcern until the sportsman or his dog is quite near him; then he darts up with sudden alarm, flipping his wings with a queer motion that carries him in a zig-zag course, right and left, giving utterance at the same time to an oft-repeated note like "Scaipe!" "scaipe!" It takes a good, steady shot to kill snipe. A man who gets flustered and bangs away too quickly nearly always misses. The higher the snipe gets from the ground the more steady does his flight become, and it is only necessary to keep a steady footing and wait until his snipeship gets thirty yards off, then crack away in his direction with an ounce of No. 8 shot, which at this distance scatters a yard square. With a good aim he is apt to come to terms. Jacksnipe live in Florida, Texas and Louisiana in the winter, where the great flat prairie marshes afford them satisfactory accommodation. At this season of the year they go North with the ducks and swans, and raise a family in some swampy region. The Southern snipe is the best, because they are killed in the early spring. During the fall their family cares make them thin, and they are no such choice subjects for a generous palate nor such gamy birds to kill in the field. In hunting them a dog is not usually essential. They can be more readily kicked up than the partridge or the woodcock. Snipe should be cooked like the woodcock, with all of his intestines left except the gall and crop. His head should be picked clean and his bill thrust into his breast. If a little high in flavor he is more appreciated.—*Baltimore Sun.*

JUNE WOODCOCK.—Philadelphia, June 14.—Again I have to report this year the illegal shooting of woodcock, or I should say the intention on the part of those who should know better, to go out before the law allows the birds to be shot. Only to-day, while at a prominent gun store in Philadelphia, I asked the question of a gentleman whom I thought posted on the subject, if woodcock had bred in any numbers in a locality he frequently visited. In reply I received the answer that many had been seen and that next week he intended getting into his boat with his fishing tackle as a "blind", and slip up a creek running into the Delaware River, and kill a few birds. "If I do not do this," he added, "I will get none in July, as they will all be cleaned out." This is one confession of intentions of two that have been made to me. I would add that the ground proposed to be visited is in New Jersey, where of all places around us the law is supposed to be the most strictly enforced.—HOMO.

WANTS A MOOSE.—Philadelphia, June 6.—I wish this coming September to make a trip after moose. Can you tell me where to go with any chance of success, or put me in communication with any one who can give me the required information. This will greatly oblige one of your earliest subscribers.—W. D. W. [Write to Ned Norton, Colebrook, New Hampshire. Col. Cecil Clay, who wrote "Among the Moose" in our last volume, could put you on the right track, if he would.]

GAME IN SULLIVAN COUNTY.—Monticello, N. Y., June 7.—"W. C. M." or other parties wanting good bass fishing and partridge and woodcock shooting in August and September, will find it at this place. Trains leaving New York city in the morning via Erie Railway, arrive 2 P. M. same day. To parties inclosing stamps I will give any desired information.—FRANK KENT.

GAME RESORTS.—We shall be pleased to receive for publication information about desirable game resorts. Sportsmen are invited to send us notes of their experience.

'COONS AND 'COON-HUNTING.

[Read before the New Hampshire Fish and Game League, by Mr. John Foster.]

THE naturalist has given the 'coon but little attention. Usually he has been accorded a classification, a half page of imperfect description and oblivion as to his real merits. The hunter has not generally adopted the 'coon as his favorite game, and he is less hunted than most of our game animals. His habits all have a tendency to conceal him from the sight and knowledge of men, and it is not an unusual thing to find in a good 'coon country those who, though living among them for years, have never seen one, and whose ideas of their habits are vague and indistinct; nevertheless, those who do choose to hunt them become the most enthusiastic of sportsmen, and place the pleasures of the 'coon hunt foremost of all. To all who are interested in animal life, either as scientists, sportsmen, or lovers of nature, we extend the assurance that a visit to the haunts of the 'coon, an interview with him in his own forest domain, an examination of his habits, his food, and the ways and means of his capture, will prove a very pleasant adventure. An animal of marked and peculiar habits, a good liver, choosing a wholesome diet, possessed of the cunning of the fox, most affectionate to her little family, defending them at times with great bravery and a shrewdness which amounts to strategy, such is the 'coon in its native condition.

The raccoon, *Procyon* of the scientist, but in familiar phrase the 'coon, is positively an American. His family is represented on both the American continents, and in no other lands. Our own North American 'coon is found from Canada to the Florida Keys, and westward to the Pacific coast. In different sections he undoubtedly has different habits; in the cold Northern States he reaches a greater development, and is a far more gamy animal than in the South. His average weight in our State when his full growth is attained is a little less than twenty pounds. The females do not often weigh over seventeen or eighteen pounds, and the males seldom over twenty-two or twenty-three. We rarely catch one as heavy as twenty-five pounds. The largest one we ever caught tipped thirty pounds. We have heard of 'coons being captured weighing as high as forty pounds, and we consider the parties who have given us this information in most cases reliable. We seldom catch the heaviest 'coons, for the reason that when they have reached their greatest weight they range but very little, and therefore the chances of the dog striking their track are greatly lessened. Their flesh is by some prized very highly it is wholesome, and if properly cooked is certainly very nice food. One decided peculiarity of the 'coon is the coldness of his scent, as hunters term it; that is the small amount of animal scent which he leaves in his track, thus rendering it extremely difficult for dogs to follow him. The characteristic is stronger at some times than others. Through the summer months, when the young are under the mother's care, and are

unable to defend themselves, this lack of scent is most apparent, and through the month of September and the early weeks of October it is a good dog that can successfully follow their blind and puzzling track. Later, the scent becomes stronger, and in the months of November and December it is comparatively an easy matter for the dog to follow them, though then the track is cold compared with that of other animals.

We think the 'coon prefers to live in the vicinity of civilization rather than in a wholly wild country. In sparsely settled districts, in the large tracts of forests which we still have left, the 'coon makes his home. His domicile may be a secure and cosy cave in some ledge on the hillside, but perhaps it is more likely to be in a hollow tree; and here, when the storms of winter come, the whole family go, to sleep the long sleep of winter; to sleep free from the cares and dangers of their little world, to sleep forgetful of invading foes, the battle with the dog or the stern race for life. The warm thaws of February awaken them, and in obedience to their mating instincts, they travel long distances on the snow, and it is claimed by some that they then perish in great numbers if the weather becomes suddenly and severely cold. This may be the most probable theory of accounting for their great scarcity in some years.

In general, the 'coon has many means of self-defense and self-protection; he is sly in his travels, even in the night; never emits a noise of any kind that may disclose his whereabouts; his extremely puzzling track protects him at all times from random, untrained dogs; seldom visible in the daytime, he is safe from all day hunters; and though formed more for strength than speed, by adopting many a cunning ruse he can run far before the fastest hound; he will jump from a tree into the very midst of hunters and dogs, and lead them all a long and wearisome chase, and sometimes escape them entirely. The dog can undoubtedly run much faster than the 'coon in a fair race, but he is greatly retarded by being obliged to unravel as he goes the cold, almost scentless track, and thereby the latter has a great advantage.

The young 'coons appear about the middle of April, from four to six in a family, and long afterward they are under the control and faithful guardianship of the mother. In the hunting season she is with them, and under her guidance they are oftentimes saved when the hounds are on their track. She carefully guards them in their tender, helpless age, developing in them the instincts by which they are to live and protect themselves. Unless disturbed and broken up by an enemy, the little family continues together for a long time; through the summer, autumn and winter they occupy the same home, and by some it is claimed that they breed but once in two years, and that the flock is not separated until the young are fully grown, which is at about two years of age. If this is so, and there are reasons for thinking it may be, then the 'coon is without doubt the most faithful parent animal we have, for we know of no other which cares for and retains the society of its young so long. Unlike the female, the male 'coon is an unsociable, unfatherly, ascetic old fellow; solitude and silence best suit him; he ranges far and alone. To tree two old males together, or one with a female or young ones is a thing of the most rare occurrence.

Their food in the spring and summer consists of frogs, fish and nearly all kinds of animal life that exists in and around our streams; and in meadows, bogs and marshes their tracks are often seen; here they will dig for grubs, lizards, frogs and snails. They are fond of berries in their season, and in September their track is often started in a blueberry or blackberry patch. Black cherries they are exceedingly fond of, and they will go far to get a meal of this favorite food. The cornfield they sometimes visit early in the season when the young corn is sweet and tender; this they are fond of, and when once the field has been discovered it is sure to receive repeated visits, until the farmer discovers "signs of 'coons in the corn," and then there is great preparation among the boys for a 'coon hunt; the neighbors are invited to the soiree; the family dog, whose recommendation is that "he's great on woodchucks," is drafted into service, and under the brilliant harvest moon the hunt begins with the cornfield as an objective point. If the dog succeeds in surprising the flock he may secure a trophy, but most probably the result will be a general stampede for the woods with the pursuers in the rear; the hunters urging on the dog, who is, through no fault of his own, as incompetent to follow the track as his master. And so the hunt winds up with a shadow of disappointment; but still it has afforded an hour's recreation for the overworked farm boys. And gentlemen, as true sportsmen, we should ever extend our sympathy and encouragement toward the sports of the boys of the farm; their hunting days are few, their business hours are from sun to sun, they are toilers, and are to be the bone and sinew, perchance the brain, of the future, to them is given little chance to train the eye and nerve to the glass ball or the flushed bird, their old-styled guns cannot compete with your improved breechloaders, their dog must be watch dog, farm dog, and hunter all in one. You invade their hunting grounds, and as they toil they hear the crack of your gun, and know that the fine coney which they have watched and doted on for weeks is being exterminated by skilled hunters and unerring dogs, and if, as the only way to compete with you, they gather their game a little early in the season, or here and there set a few snares in the woods on their own land, in rendering judgment or criticism, let us remember that it is but human for them to enjoy their own sport in their own way, that we shoot twenty birds where they snare one, that we have never been favored with a revelation disclosing which is the proper method of slaughter, and therefore in construing the law we should be liberal, and in applying it we should be charitable.

The food of the 'coon during the best part of the hunting season is the mast of our various nut bearing trees, chestnuts, beechnuts, acorns of the different kinds of oak. Sweet apples are eaten when they can be found. They have the fondness of the bear for everything sweet, and when captured young are easily tamed by feeding them on sweetmeats. They eat insects of various kinds; have been known to eat grasshoppers, but whether from necessity or choice we cannot say. But the food relied on for the purpose of preparing for winter is certainly beechnuts, chestnuts and acorns, the two former kinds being preferred. In years when nuts are scarce the 'coons are never found to be as fat, and in the winter following such a season they are often found, even on the coldest days, searching through the snow for food, sometimes going even so far as to enter the barns and outbuildings of the farmer. They are then piteous looking animals indeed, and one would hardly have the heart to destroy them. They are very fond of water, and on starting out in the evening they immediately go first for drink; in a dry season they often travel far to find it. One learned writer says that they always dip their food in water before eating it; but, though knowing them to be strong teetotalers, we do not believe they go to that extreme.

If we are to hunt the 'coon in early September, we shall expect to find him in the lowlands, along brooks, and about ponds, meadows and marshes; black cherry trees in bearing are sure to attract him, even if he makes a long journey to find them. Later, after the early frosts, we should traverse the highland forest, where nut trees are in bearing, preferring a growth with beech or chestnut or both intermingled, but still remembering that among the oak growth they are often started. And it is well in going from one point to another to follow in the line of brooks and water courses as much as possible, for these are the chosen highways of the 'coon.

In our judgment cornfield shooting is the poorest kind of 'coon hunting; they seldom pay much attention to the cornfield except very early, and then many are too young, and all are too poor in fur and flesh to kill.

The hunter, when he starts with his friends for a night's sport, should know where the game lives, where the streams are, what food is in season and where it is to be found; he should move first in reference to the home of the 'coon, next in reference to the nearest stream or watering place, and then he should thoroughly hunt over the ground on which he is most apt to feed. Of course, a strict adherence to any rule in hunting is not to be expected, but our object is to suggest the conclusion that success is in a great measure due to the hunter and his methods of procedure.

The subject of dogs is an exhaustive one. A volume might be written on 'coon dogs alone. Every hunter at some time or other has his ideal dog; perhaps at the present only a tradition, but once an actual being, the pride of his master and the terror of the 'coon. The hunter never wearies of recounting incidents of the past; and as the old soldier of the "Deserted Village" "Shouldered his crutch and showed how fields were won," so have we been entertained on many a tramp by some old veteran of the woods with graphic descriptions of the exploits of the "old dog." How many times have we heard when on a hunt and our own dogs were working well, the expression, "Oh, if I only had the old dog!" How the love of the master for the "old dog" lingers! There is true affection between the hunter and his dumb companion. He may be poor, destitute, almost hungry, but you cannot buy his dog. Through the few years of the faithful creature's life they live and hunt together, and then the new dog comes, but he is not the "old one;" there can never be another "old dog." His memory is ever kept green; stories of his prowess are ever at hand ready to eclipse the achievements of any living dog that comes up for praise. And as each hunting season returns and again we gather for the chase, while waiting for a bark, stories are in order; the veteran hunter leads and in imagination the "old dog" hunts again. Though his kennel stands empty, "Yet back from the hill the voice of the hound in the morn echoes still." When old Polonius in the play asks Hamlet what he reads, Hamlet answers, "Words, words, words."

And when we answer the question, what insures success in hunting 'coons, we should in the same spirit answer emphatically, dogs; not this breed or that in particular, but dogs; those which can do the work, for pedigree is no essential part of a 'coon dog. He may be, as *Edgar* in "King Lear says,

> "Mastiff, greyhound, mongrel grim,
> Hound or spaniel, brach or lym,"

but if he is the successful dog his value is assured. Of all dumb animals we place the dog first, perhaps not the most useful, though. Baron Cuvier, one of the world's greatest naturalists, says of him, "It is the most singular, the most complete, and the most useful conquest that man has made."

By his intelligence, his adoption of reasoning methods, his great courage, his wonderful gift of the power of scent, and his affectionate devotions to his master, has the dog deserved that praise which the song and story of every age and tongue have bestowed upon him.

The good 'coon dog must have nearly all of the best qualities of the dog family; he must have intelligence, courage, patience, endurance, and above all, the strongest powers of scenting four-footed game, rarely are all these elements developed in the same dog, hence good 'coon dogs are rare, but when these characteristics do appear, then with proper training one can have a first-class dog.

Although a good 'coon dog may be found in nearly every breed and grade of the canine race, still in certain breeds there are conditions which lead us to have a preference, and for ourselves we certainly look first among the best blooded hounds, and if we find one fulfilling the essential conditions, he is surely the dog we want, for if not already trained, he can, with proper care, be taught to forsake all other game, and his strong hunting instincts be trained to bear upon no other living animal. He becomes most devoted to his master, is cool, patient and enduring, and when in the hunt he has no other purpose but to press on to the end of the track. Usually a great ranger, he saves you much travel by finding his own tracks. He is kind and affectionate with his friends, but when aroused by an enemy is brave and tenacious; but over and above all these, he is the very personification of scent, and is therefore, other things being equal, the best track dog in the world. A common type of 'coon dog is a cross of the hound with other breeds. We have known the spaniel, shepherd, mastiff, bull and mongrel, each crossed with hound, to produce good 'coon dogs. The cross hound and spaniel is a dog of good scent, but is very nervous and not a hardy dog. The hound and shepherd is well spoken of by those who have used them. They have intelligence, good scent, are good rangers and are very hardy. The hound and bull is a combination of scent and courage which often makes a very successful dog; he is generally, as it is termed, a good sticker.

The hound and mastiff produce a dog that is quite sure to be a 'coon dog if trained; he will not have the best of scent unless it is taken strongly from the hound. He will be a still-runner, and an intelligent, brave and faithful hunter. The cross with the mongrel or the mongrel himself is of course an experiment; as a rule it does not pay to train one, but still there are decided exceptions, and a common, homely, friendless cur, picked up in the streets, has been known to make a most successful and valuable 'coon dog.

A number of years ago we hunted a few nights with a common black and tan terrier, a little larger than the ordinary size; he had received little or no training, and had taken naturally to 'coons. His scenting powers were remarkable, and we remember him as one of the best still-running dogs we ever saw.

Hence we reach the same conclusion which we premised in beginning our remarks on dogs: the 'coon dog comes from the canine race at large and is confined to no particular breed. Some 'coon dogs run still, that is, do not bark on the track, barking only when the game or the tree is reached. There are advantages in this class; the 'coon, having no notice that he is pursued, has not the chance to lead off to avoid the danger or to choose ledges, bad trees or water, as is often the case before a barking dog. But our own theory has been that the still-running dogs are, as a rule, the weaker scented class, and hence not to be compared in value to the stronger-scented, track-barking dog.

To this rule, if it be one, there are some strong exceptions, for we have known the best blooded and best scented hounds, naturally track-barking dogs, to have adopted, seemingly as the result of a reasoning process, the habit of still-running. No matter how hot or how cold the trail when he finds it, not a bark escapes his throat, but with nose to the ground, the still-running dog glides like a shadow through the dark forest; as he draws on to his game his muscles grow tense, and he steals like a cat on his prey, then with a rush and a roar he is upon it; the great caution of animal succumbs to fear, the mother 'coon and her family are stampeded in an instant and forced to seek the nearest tree, be it large or small. In this way a whole flock is sometimes secured; but, notwithstanding, we prefer the music of the barking dog; he is a more entertaining animal, generally has better scent, and, as a rule, is more successful in the end.

The retreat of an old 'coon before a barking dog is sometimes a finely executed affair; it is planned deliberately and well; it is conducted so as to puzzle and throw off the dog if possible, over ledges, along stone walls and rail fences; now a tree is climbed and from the extremity of a long limb he jumps to the ground again; he wades the brooks, takes to the swamps, then back to the hills and runs round and round some dry knoll, repeating his tactics over and over again: and it is on such a track as this that the best test of the dog is made; here is where the cross-breeds give up in despair, while the grand old hound perseveres and secures the prize.

When we start on a 'coon hunt we should equip ourselves with an axe, a pair of climbers, a .38-caliber revolver, a cord of 100 feet in length, a compass and a pair of pincers to pull hedgehog quills with, for the best trained dogs will sometimes get quilled, and they must be at once extracted or the dog is ruined.

It would be well if every person in the party took a lantern, as in a dark night you cannot have too much light. If you have a good climber in the party a gun is not actually needed, as your climber can climb the tree and with the revolver shoot out the game; if while in the tree he wishes for a lantern or to reload his revolver, he communicates with those below by means of the long cord. Never permit the dog to fight the 'coon till he kills him, for nothing wears a dog out more than this, but be ready with crotched sticks (good strong ones) with which to hold the 'coon down as soon as possible after he strikes the ground; then let the dog have a grip or two, and taking him off, finish the 'coon as quickly as possible. Another thing, never leave a 'coon in a tree after your dog has succeeded in getting him up, if it is possible to get him. Stay at the tree till morning, exhaust every device before you give him up, for nothing encourages a dog more than to know that you are willing to work as hard as he does to get the game; be true to him; get his game for him and he will be all the more true to you; he will work harder on the track, and stay at the tree all night if you do not come before.

Gentlemen, I have exhausted my time and your patience, though not my subject, and in conclusion permit me to say, though hunters, like other men, grow old, and in time a new generation appears in the field, long may it be ere the mantle of the prince of 'coon-hunters shall fall from your president; long may the afternoon sun shine bright as the sun of the morning.

A PEN AND INK SKETCH.

THE heat of summer came with that day, when the first gathering of the faithful met in this present June.

In the preceding week sharp frosts, bold and adventurous, and far from their "base lines," had dashed through the later days of May, and wrought havoc and carried chill and disaster along the entire track. With noiseless speed, and without visible smoke or tell-tale smell of burning, this squadron of frost left in its path the shrivelled leaf and drooping vine and blighted blossom, like a sharp and unsightly scar of a sabre cut across the soft and fair cheek of youthful promise.

But this day was warm, nay, was hot; and fright and discouragement gave place to good cheer and confidence again, in the presence of this friendly force for good.

It was to be a "regular monthly meeting," and "business of importance" called on "every member to be present." Not every one who is called, however, comes, and many are the excuses which stamp their makers with "found wanting."

One distinguished member, whose absence is always advertised by the greater quiet which the loss of his voice establishes, doubtless will plead the enforced attendance at court, and the impossibility of leaving his clientage to compromise and settle their cases, simply and satisfactorily, during his absence, to his great and uncompensated loss.

Another—whose large and growing practice claims from him twenty-four hours of the two dozen which each day affords—will argue as excuse, the suicidal course which attendance at the grounds would prove, in that possibly during those few grateful hours of relief and freedom, some patients might secure sufficient strength to shake off his shackles (and him, too) in a return once more to health and vigor.

A third—whose time is heavy with opportunity and leisure, and who really is old enough to know the value of first impressions—will claim that, instead of coming to the house and magnificently carrying off honors as figure-head (which he inwardly knows to be right and his duty), he must remain near the sound of the calliopic screech-seeking inspiration for a newly to-be-devised "smoke stack," lest some "consolidated" competitor should secure a further "bulge" on him.

And so the list might be extended. Doubtless some would have pleaded that insanest of all excuses, "that they had married a wife" (in our club, it is not to be denied, we have many degrees of intellectual capacity), for many were absent.

One bright, cheerful face and ready, steady hand, we think of in particular. A man who passes his time with *understanding*, and who *shoe-d* know what was *fitting*, *sole-d* himself and stand away, after promising his fellows faithfully that he would make a *corn-er* for these days.

But the faithful were there. The day was hot, the sun oppressive. With windows of shooting house thrown wide open and doors flat back, however, a kindly and refreshing breeze drew through the retreat, already shaded and cooled by the protecting arms of friendly trees. And here came in, in careless and happy irregularity, one after another, the faithful few whose names are inscribed in letters of gold in that book which records the list of good men, who shoot all they can, and wish they could shoot more.

With chairs tipped back, with the curl of fragrant blue smoke rising like the incense from an acolyte's swinging urn, in happy, lazy waiting, the "meeting" did not come to order, but chatted and talked, or were silent and listened, as the mood swayed.

We wondered if the absent had been "taken" in the raid of Jack Frost, referred to at the beginning. We wondered who would "take the cake" in the afternoon's shooting, and after such wondering, now and then two or three would step out to the "firing point," and the sharp crack of a full charge of black, or the flinty snap of wood, powder, showed that the answer was uncertain, and that perhaps a little preliminary practice would not be harmful for any. Never mind who really made the highest score; they were all high and always are. We shoot very well and we know it, and we do not care to say any more about this; but a sketch, a pen and ink suggestion, of the faithful perhaps might serve as helpful models to those of your younger readers who are attracted by, and "know a good thing when they see it."

A thrush filled the air with his sweet song in the edge of the woods across the field, while near by, little finches hopped to and fro, in happy security, and in the nests hidden in the grasses here and there, little open mouths waited a providing parent's return. A pair of nighthawks, the first we had noted, made their way far off across the sky, while nearer the earth and nearer to us the cry of a Wilson's peewee joined the restful harmony. Bees droned, and a fitful fly or two buzzed with monotonous hum—and it was hot.

Of the faithful, who more faithful in every sense than he who is invested with the key and strong-box of the club? It has often been claimed that much practice has made him so proficient in arresting the flight of these swiftly-moving targets of ours, but I think it is not altogether that. Teaching young ideas how to shoot for many years, and being called upon to stop the flight of soaring imagination in others, he has unconsciously acquired this power himself, and he stands among us to-day with his trusty full-choke ready for trap or field—*facile princeps*. Or, if the failing score of some hitherto successful shooter seems to indicate a loss of "grip" or power, what helpful aid to a sturdy and vigorous effort to retrieve lost power, does he give us, when drawing from his store of classic knowledge he assures us that even in Virgil's time it was noted and said: "*Facilis est descensus Averni; sed revocare gradum, hic labor, hoc opus est!*" And familiar with the note of every winged songster of the forest, he will, if you will, describe and recount concerning them, until it stands as a bar between yourself and any cruel shot, which a less familiar knowledge might have permitted.

Another and a younger faithful one, in quest of a fullness of robust health, which nothing in his bronzed and healthy look indicates any lack of, sensibly takes the "outing" which an afternoon at the range affords, and thus fits himself for closer application to duty during the week. And as he tells of his winter in and along the coast of Florida, there seems to come in through the open window the smell of the orange blossom and geranium, and we almost look for the ugly snout of some wandering alligator to turn the corner of the open door.

A third faithful is he who modestly disclaims his title of military distinction, but who gives evidence of his prowess whenever he faces the trap, and who illustrates the slaughter which would follow his opportunity, by the relentless way in which he smashes glass and clay. Devoted to the successful development of teeming field, and showing in well-filled barns and increasing herds, the intelligent management of a well-ordered mind, he yet seeks the rejuvenating and healthful influence of a day's sport, and actually grows young while years accumulate.

In another we see the evidence of the good influences of such a companionship and season of sensible recreation. As the day comes round to the "weekly field day," so is this one found, generally without fail. Office desk is closed, the hum of machinery with its busy wheels and industrious cogs is left behind. Tired head and weary body are refreshed, and each breath drawn in the free outer air furnishes its stimulant and invigoration, as an increased bank account to check against during the week.

And yet others—this time a young man! Finding in this weekly afternoon a sort of De Soto's fountain, he drinks deeply of it and seems to be finding the secret of perpetual youth therein. And in this flush of youthful strength he illustrates its power, in capturing the "championship" when he attempts it (and also the good nature of confident ability in letting it go when some cantankerous competitor seems to require it to make him happy).

And the man who handles diamonds as we others do pebbles—whos

touch is as familiar to gold as is the touch of many to dirt—he is faithful, and will be to death. His "sweeps" turn to gold and his "pots" to silver, and we believe his "carats" are finer by reason of these days with the chosen few.

There is another, who means well, but who is not quite so faithful; 'tis he of the ready hand. He delights in the sport for sport's sake, but also for what it brings in its train. For is not powder required, and do not shot and shell play their part, and are not guns needful to the play? And he will give you (for your money) what you need, and perhaps a little more, for the influence of these days is healthful and elevating. (*May-it* continue to be so!)

Good-fellowship, common interest, cheerful spirit and proper emulation mark these shooting days in "red letter." And we pity the tired professional man, merchant, manufacturer, capitalist or employee who does not belong to a "shooting club," and who cannot enjoy all that such a membership makes possible. B.

Camp Fire Flickerings.

"That reminds me."

116.

THE following is related by Col. Elder, a courteous and entertaining officer of the regular army, stationed at Fortress Monroe:

Dr. S. prided himself upon his skill as a woodsman and rifle shot; but his merit in this regard was not recognized by an uncharitable world. One day he and Captain B. went out deer hunting. They separated, and soon the Captain heard his companion shoot. A moment later a terror-stricken calf rushed frantically by, and had scarcely disappeared in the bushes before the Doctor ran up and inquired if the Captain had seen the deer, which he was sure was mortally wounded, pass that way. "Why, Doctor," exclaimed the Captain, "is it possible that you took that calf for a deer?"

The Doctor's countenance lengthened; and then "a light on his visage spread," and he replied: "I was not certain whether it was a calf or a deer, and I therefore aimed so that I would hit if a deer, or miss it if turned out to be a calf." N. S.

117.

Away down in Dorchester, New Brunswick, lives Deacon Willard Lawrence, who, outside of his piety, is as fond of his gun as the most inveterate sportsman. Yesterday (Sunday, March 30) on his way home from prayers, a small boy rushed excitedly up to him and pointed out a flock of about twenty wild geese that had settled on the marsh near the shore of the Memramcook River. They were the first of the season, and the deacon's blood bounded; but with a mental "Get thee behind me, Satan," he resolutely went into the house and took up the family Bible.

Failing to get interested, he took down his gun and looked at the loads. Three A in one barrel, No. 1 in the other. He would just go down and see if he would have had any chance to get at the geese had it been a week day. In his absent-mindedness he takes his gun aloug and goes to his side-wheel punt on the river bank, and sits looking fondly at the huge birds which are walking slowly toward him. The tide, which has a rise there of thirty feet, soon lifts his boat, and he lets her slowly drift up the stream.

Suddenly three black ducks swim out of a cove and come toward him in a line. Habit is stronger than faith, and he blazes away instinctively, and in a trice the three birds are in the boat at his feet. But the noise of the gun startled the geese on the marsh and they lazily raised and swung over into the river about forty rods away. Alas for the orthodox deacon; the hunter's spirit is mighty within him, and seizing the cranks of his paddle wheels he slowly but steadily turns toward the game, each revolution of the paddle wheels bringing him nearer his quarry. Three birds in range; bang—and it is done, and with the six birds the good man returned to his home.

In relating at the next class meeting his temptation and fall from grace, among his experiences, notwithstanding his self-abasement and repentance, it was thought there was just a slight ring of satisfaction in his voice as he described the way in which those three geese tumbled over at one shot. ARBHEE.

118.

It used to be common in the good old by-gone times for the rustic farmer boys on the banks of Holsten, a beautiful stream in Southwest Virginia, to fish of spring nights, under pine torches, armed with cedar bows and small "gigs" on their arrows, which, by the way, they shot with the accuracy almost of an Indian.

Pete Totten, a conglomerate mixture of Dutch and Irish, a little dried up fire-and-tow fellow, tallow-faced, with little patches of thin beard, yellow, stringy hair, towlinnen breeches and one yarn "gallis," lived near a large family of boys, whom he called "Grimeses," a set forever torturing Pete, yet this had a charm for him.

Pete and the Grimeses were one night at their favorite sport of torch fishing, and as they approached a long sandy bar Pete says: "Er, er boys, look out for eels." Pete, who was barefooted, had his bow at a present and arrow fast on the string ready to shoot, and instead of a noisy stride he kept his left foot stuck out in front, quietly sliding it along in the sand. Presently Pete squared himself and said, "Er, er stop; gad, boys, here's the biggest eel in the Holsten!" Pete took a long, steady pull on his bowstring and "chuck" went the cruel arrow. "O, lardy, lardy! heavens and yeth!" cried poor Pete, as he involuntarily cast his bow over his head and fell backward in the water, his foot lifted above, with the barbed arrow through his bleeding big toe. The Grimeses carried him to the bank, where they forcibly extracted the arrow with the aid of a barlow knife. Pete now and then saying, "Er, er, darn you Grimeses, you'd laugh to see me die." GRAEME.

119.

Some ten years ago, in a village not fifty miles from Brooklyn Bridge, there was considerable rivalry as to who brought in the finest strings of trout. Among the lot who were striving for supremacy was my friend Dan C. He could generally tell of bigger strings and bigger trout than the others.

Dan went off trout fishing one day, and just outside of the village he espied a small Dutch boy, with a bean pole and a cord for a line, swishing a very large fish about in the creek. Dan saw that it was a trout of over three pounds weight. The boy told how he had got it stuck fast between two stepping stones in the creek and had struck it on the head with his pole, and then tied it to his line to have some fun with it. It did not take Dan many minutes to catch that trout from the boy with a ten cent bait, and both went off happy. In a few hours Dan returned, went into the grocery as cool as his excitement would allow, and tried to make it appear an-every-time-I-go-a-fishing occurrence to catch a trout. The palm was at once awarded to him, and the fish spread a gleam of truth to his sitting-on-a-barrel stories.

After the boys had all seen it, he presented it to the most popular gentleman in the village. That night the boys were in full force in the back part of the grocery, and Dan was reciting to them how he hooked the fish, the rushes for liberty it made, how he worked it up and down stream, the narrow escapes he had of losing it around a big boulder, how it got under a bank and sulked, then of how he had to get into the creek up to his middle in water to keep clear of the brush, and finally how he led the prize to a little sandbank, got behind it, and threw it out on the bank. He had just finished his glowing description when a big Dutch woman and a little boy came into the back part of the store. The boy walked up to Dan, pointed his finger, and said "Him." The woman held out the ten cent bait, and addressed Dan: "Mishter C——s, the pig vish my poy catch vas ash pig ash vorth two tollar," and she demanded the fish back or two dollars, or she would make trouble for him for cheating her little boy. Dan forked out the two dollars. A. MAC.

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—VI.

A MILE or two from where we saw the deer, a small cleared spot in the woods at the water's edge, and the tinkle of a little stream running into the lake, invited us ashore to slake our thirst with the first *"clear, cool, spring water" we had found since leaving camp. On getting out, we found this cleared patch of a few rods in area to be the site of the Hughes party's camp of the previous year, recognizing it by his description of the little stream.

The source of this stream, as near as we could see, was a snarl of cedar roots a short distance back in the swamp, from under which it gurgled into a clear, shallow basin, of perhaps fifteen or twenty yards in circumference, and found its way through a tangle of bushes into the lake four or five rods away.

In this basin Brother Hughes had told us he saw three or four small trout the year before, but a cautious and careful scrutiny of the little pool failed to show us even a sign of any kind of fish, and we concluded that the aforementioned trout must have been small barred perch that had escaped from their minnow box, the remains of which we had seen at the mouth of the brook.

Reasoning from this tale of the small trout some months before, we had hoped to find somewhere around the lake a stream or two in which might be found trout of larger growth, but after a careful look into every one flowing into it, within the next four days, we were convinced there was not one in which a respectable trout could procure an honest living, and we were forced to appease the craving of our "trout tooth" with fish of grosser fibre.

Leaving the basin we strolled around the clearing, finding plenty of "sign" of a not very old camp. Here stood a couple of upright poles with a ridge-pole still in place; over there against a tree was an old settee in the rough, which showed considerable skill in workmanship, and near by were the marks where the tents had stood. If all other signs had been lacking of some one having been there before us, there, lying in the sand was the tell-tale old oyster can and fruit can, battered and weather-stained, its mission performed and cast aside to be trampled under foot or be kicked out of the way by the next comer. Broken bottles scattered around in some profusion, several with the labels still adhering to them, proclaimed that the last campers belonged not to the "prohibition party," as the legends on the bottles were mostly in the French and Kentucky languages, with Kentucky slightly in the majority. As we walked back to the boat, Dick remarked in his dulcet mezzo soprano, "Must a' had a revival 'round here from the looks o' the bottles; don't wonder at 'em seein' trout in that little pond."

Back out to the edge of the bar again we went to fishing in earnest, but we must have done something that day to set the fish against us, for not a fin could we stir, nor could we see a fish of any kind anywhere on the broad expanse of the shallows inshore as far as our eyes could reach; however, we were enjoying ourselves this quiet lovely day like a colored brother in a "water million patch," and we persuaded ourselves that we didn't care much whether we took any fish or not, we were merely exploring and studying the waters.

Dick lit a fresh pipe, and hitching himself a trifle to starboard in obedience to a nod to trim boat, summed up the measure of his content by saying, "Now, some fellers want to catch a fish every five minutes, but I don't. Of course, I like to catch one once in a while to keep my hand in, but I'm enjoyin' this boat ride [I was at the oars] an' the scenery so well that it's perfectly imperial to me whether I catch a fish to-day or not."

Dick is clearly a philosopher.

A mile or two further up the aspect of the shore changed, a low wooded hill pushing down to the water in place of the flat strip of bottom land and swamp we had been coasting along ever since leaving the place we had first landed.

The bank along here for some distance, and out into the water for several yards, was lined with a layer of boulders, large and small, so evenly distributed that in places it looked like a wall built by the hand of a master mason. Here, and at the ledge at the head, are the only rocky formations to be found around the whole shore line of the lake.

We had reeled up and left the outer bar and as we rowed along close in shore a little stream trickling down through the rocks said plainly to us. "Come in out of the hot sun, ye luckless fishermen, and cool your parched gullets with a cup of my crystal waters." In response to this invitation we pulled the boat up on the rocks and pushing our way through a fringe of bushes at the top of the bank found ourselves unexpectedly in a small hay field, surrounded on three sides by woods. The hay had recently been mown and cocked but nowhere could we discover a sign of a habitation except a small dog tent a few rods back in the field in which we found the household furniture of the party who had, no doubt, harvested the hay. This was in the shape of an old blanket, a small box containing a knife, fork, tin cup and a piece of bread hard enough to break up into flints, and just in front were an old frying-pan and a little black coffee pot near the remains of a small fire, all of which had the appearance of not having been used for a week or more.

But as we were not particularly interested in this solitary camper, we left the meager outfit undisturbed; Dick remarking reflectively that "from the general look o' things, that feller must have been playin' hoss, as he could see nothing to eat around there but hay." Down in a corner of the field, near the top of the bank, we found a cool little spring, walled up with rocks and nearly hidden by overhanging bushes, which proved to be the fountainhead of the rivulet running into the lake near where we had left the boat.

After drinking our fill at the spring, we combined a stroke of business with the pleasure of our ramble by adding a half dozen frogs to the bucket, which we caught along the marshy strip on either side of the spring branch; not that we had found any special use for frogs that day, but it is always well to provide against being caught short in the matter of bait should the fish form a combination against you and call for more than you can put up. Dick must have had something like this on his mind, his look ahead for sport to come taking shape and voice as he made a sudden dive into the marsh, exclaiming, as he came to a perpendicular with a handful of mud, grass and frog, "Let no speckled frog escape!"

Back in the boat again, we pulled out to the break of the bar and began fishing, but with all our arts and wiles we could not induce a fish to accept any of our most seductive lures and promises of gentle handling. All our knowledge of the gentle art availed us nothing; our "science" was wasted on the desert air, and we made up our minds that the whims of fish are governed by no conditions of wind or weather when they take a notion that they won't bite; that their ways are peculiar and slippery—fish ways, so to speak, and past the understanding of man. Here were Dick and I, two old veterans of the rod, with venerable streaks of silver running through our (self) respected locks, fishing from early morn till high noon over miles of as good looking water as ever a cast was made over, on a perfect day, with the wind just right according to all traditions and teachings, and not a single, solitary sign or symptom of a nibble. We had thought we knew a thing or two about the habits of bass and where to look for them, but to-day the results of a patient study of years, all the well-thumbed and fine-spun theories beloved of the craft were knocked higher'n a kite, and our smartness as bass fishers received a shock from which it took many days to recover, and it is a matter of serious doubt if we ever do get entirely over it; at least, it will be a long time before we hear the last of that day's fishing from the boys.

Hereafter, let no brother, overburdened with "bass smartness"—as we were—have the hardihood to say to Dick and the writer that he can pick out a day and go out and catch as many bass as he may have a mind to; we'll none of it.

We were now well up to the head of the lake and in plain sight of the bridge over Rainy River, and as the sun had tilted over the noon mark some distance, we decided to beach our boat somewhere near the mouth of the river and eat our lunch. The water seemed to get blacker as we neared the upper end of the lake, and all along here, as far out as the deep water, we found streaks of "musrat grass" and patches of scattering bulrushes growing up from the bottom—but no fish.

A solitary Mossback in a boat, coming from the direction of the Rocks, was hailed as he passed by us, and asked if he could point out any particular locality where a few bass might be found by diligent search. Pausing a minute, he replied, "You're right on the best bass water in the part o' the lake—ketched any?" "Nary a one," was answered. "Well, if you don't ketch 'em round here, you won't ketch none nowhere. I've ketched many a whopper round here in this grass" (bet that's a whopper, whispered Dick), and the oars fell, and he was off in the direction of the hay field we had just left—the same "feller," Dick guessed, "that had been playin' hoss." As no whoppers or any other kind seemed to be hankering after frog, fly or spoon, we reeled up and went ashore near the mouth of the Rainy to rest, eat a cold dinner, and figure up how many fish we should have taken since leaving camp.

The water of this river is very dark colored, but from where we stood on the bridge we could see the bottom plainly for twenty or thirty yards above. The stream here is not wide, sixty or seventy feet perhaps, with a depth of six or eight feet of water and a sluggish current that is hardly perceptible. Swimming aimlessly along the bottom here and there we saw several great lazy "red horse" and suckers, but we looked in vain for sign of minnow or other small fry that we might turn to account for bait.

A few days after this we made the acquaintance of a lumberman who had a logging camp and a gang of men a season or two before on Rainy Lake, and who had explored all the region around the headwaters of the Rainy and Little Black rivers. Rainy Lake, he said, was five or six miles long and in places a mile wide, and was simply a widening out of the river twenty-five or thirty miles from the mouth. The stream reaches back forty or fifty miles into a very wild region, where none but the red man, a few hardy lumbermen, or an adventurous hunter have ever kindled a campfire or broken the silence of the woods with crack of rifle.

To reach the lake by boat or canoe would, he said, be a work of great labor, as a series of sharp and turbulent rapids some miles further up would have to be surmounted, yet it might be done with much muscle, skill and perseverance, but the better way would be to haul a boat from Black Lake over a sort of blind road they had made going in and coming out as supplies were needed for their camp. He said the region around and above Rainy Lake was a paradise for a fisherman or hunter, deer and bear being abundant, and the lake swarming with black bass that "bit" so eagerly that it was only the matter of a few hours' labor to jerk out enough three, four and five pounders to last them several days, and furnish a party like ours rare sport for a week.

All this, and more of the same kind was told us one day under his little open shanty near the mouth of the Little Black (he was waiting for a run of logs coming down the river), where four or five of us had sought shelter during a two-hours hard rain storm, and as he was a man of intelligence, a good talker and seemed to be thoroughly posted about the region he spoke of, his tales of the woods and adventures on the Upper Rainy and Little Black rivers were keenly relished by every one of his listeners, and I believe we were all sorry when the rain storm was over and we went back to plain pickerel fishing.

Neighbor Merrill told us, too, that he had been on several hunts in the wilds above Rainy Lake, and the stories he told about the big game of the region drained by the Rainy and Little Black so worked up the old nimrod in two or three of us that it came near resulting in our discarding the rod for the rifle and striking a bee line for Rainy Lake to spend a week or ten days in the heart of these solitudes in serene con-

* This is solely a matter of information for brother "P. D.," not unknown to fame as a whilom contributor to the pages of FOREST AND STREAM.—K.

tent, where the smoke of the camp-fire is rare and the "resorter" goeth not.

"Why," said Merrill, "deer and bear are as plenty up there as partridges are around here in huckleberry time an' wolves too," and to me he said in serious earnest, "an' mebbe you won't believe it, but there's some elk left in them woods yet; yes, sir, elk, an' if my old Winchester could talk she'd tell you so. Jest shoulder your rifle an' blanket and come with me a week an' I'll prove it to you. We'll take Turk an' the black dog, an' if I don't show you some great sport then you can call old Merrill a liar." Old Ben and I were sorely tempted to take him at his word and go, but it was the close season and game laws are not made to be broken and set at naught by honest sportsmen, so the trip was abandoned.

We are not going to take any great credit to ourselves, however, for not going, for the truth is, Ben and I stand convicted of a violation of the game law of Michigan, in intent, if not by overt act, but if the fates don't take sides against us we may, at some time in the future, visit this wild region when the season is open, and I am convinced that with Turk and his master we could have some rare sport with the rifle, and not be ashamed to look the district prosecutor in the face should we chance on him on our return from the woods.

But this digression has no doubt lost Dick and I a chance of taking a bass or two on our trip around the lake, so to quote Old Ben again, we'll "jest hie along."

KINGFISHER.

[TO BE CONTINUED.]

RANGELEY WATERS.

Editor Forest and Stream:

The ice went out on the 11th of May. On the 13th the first visitor at the Mountain View (Mr. Littlefield, of Boston,) captured a five-pounder from the wharf. For a few days following the strikes were few and far between, but the week commencing May 25 was remarkable for the number and size of those brought to the landing net.

Of the guests at the Mountain View four hearts were made happy by bringing home a trout each, weighing respectively 7¼, 8, 8¼ and 8 pounds 10 ounces, the latter being the largest taken to date, and captured by the gentleman above named, while the number of fish weighing from two pounds up to five taken by the party was quite sufficient to satisfy the most ambitious disciple of Izaak Walton.

The Big Lake was almost as productive. Every fisherman and guide went for a "masher" of course, but the wary old fish came not to all. Brandy Point and Bugle Cove were the objective points, and long and faithfully were the shores skirted. Rangeley streams yielded a rich harvest to the seductive red ibis. Fish were taken there weighing as heavy as five pounds. It is a fact that the early spring fishing in Rangeley waters has been most excellent, and the fishermen have rarely had better sport.

An unusual number of ladies have gone in this year with their husbands and brothers, and the refining influence of their presence and their keen enjoyment of the to them new revelation of woods camp life and lake wilderness have added a zest to the trip which always brings color to the cheek, elasticity to the step, and joy to the hearts of all who have the good fortune to visit this charming section. W. M. S.

STAMFORD, June 12.

SALMON CASTING IN ENGLAND.

A FLY-CASTING tournament will be held in England, July 26, under the auspices of the *Fishing Gazette*. We take from that paper the following particulars and call attention to the rules, especially to the conditions governing the third prize, where the line must not be recovered. We understand that this so-called "switch cast" is the same one used by Mr. Harry Prichard in the contests here, and called "water cast," "hoop snake," etc. The *Gazette* says:

"The forthcoming tournament promises to be of a more generally interesting character than ever. Mr. George M. Kelson has kindly undertaken the management and supervision of the salmon anglers' competition, for which two or three pretty little prizes are offered. Hitherto, the salmon casts were demonstrated from a platform. Upon the last occasion, owing to an adverse wind, its position was not a favorable one, but, indeed, so unfavorable, that the record, though really good in the estimation of those present, will probably be exceeded this year. It is a good cast in dead water to propel 37 or 38 yards of line overhand with an 18-foot salmon rod in this country. Anglers know that our English lines are made heavy to throw from the butt of the rod, and that the American produce, in comparison, may almost be called 'blow lines,' as they are very light, and are manufactured to suit their rods, which play only in the upper joints. The consequence is that in a gale of wind the Americans 'walk in,' and we hear it reported, and see it in print, that some one or the other of them has thrown considerably over 40 yards. We can only conclude that this was with the wind. Mr. Kelson will decide upon the day whether this platform is to be shifted to more favorable quarters, or whether the casts are to be made from the bank. The prizes for this section are: Prize I.—Gold egg-cup, with suitable inscription, for the longest overhand salmon cast, to be made with any kind of rod, not exceeding 18 feet in length from the button. Prize II.—A silver egg-cup (also inscribed), for the longes cast with a rod not exceeding 16 feet in length from he button. Prize III.—A folding salmon landing net, for the longest switch cast, when 6 feet only will be allowed behind the competitor, who will be disqualified if any part of the rod or line should, while making the cast, extend beyond that limit.

"Five minutes will be allowed for each competitor to make his cast. Each competitor must have a treble and single gut trace attached to his line, the former not to be less than one yard in length, the latter not less than fourteen inches. Each competitor to use one of the flies which will be provided.

"The Americans declare they can cast as far with a 16-foot rod as with one 18 feet in length. Mr. Kelson has amply provided for this rather remote contingency. Any competitor entering for prize No. 2 who shall make a longer cast than any one of those competing for prize No. 1 shall be entitled to his choice of any one of these prizes in exchange. There are also many gentlemen in this country unaccustomed to an 18-foot rod, who fish and command the catches in their own districts with a small rod—they, too, will be favored by this rule; but we doubt whether any 16-foot rod can possibly win the 'golden honors' Long casting has been a subject for much comment from time to time, and as we know it is absolutely necessary for a salmon fisherman to be able to manage a long line occasionally, so we are pleased to have an opportunity of encouraging it. Mr. Kelson holds that if a fish is properly 'hit,' as he described in the *Fishing Gazette* of 8th March last, it is immaterial whether the strike is made at twenty or thirty yards—the result is the same, or, rather, it should be. There can be no shadow of doubt the nearer one gets to his fish the better it is under control; but often salmon anglers are engaged in a good 'up and-down mill' sixty, seventy, or even a hundred yards off, and when their fish has been struck in the way advocated in Mr. Kelson's articles, how rarely it is that the 'hold,' even after an hour's fight, has been torn or enlarged. Why did Mr. Kelson suggest the late improvement in the patent lever winches? Why did Mr. Ridley devote years to his lines? Because salmon originally out of reach might be hooked and, when hooked, could be mastered. We suggest that competitors should loop their single to the treble gut. There will be a few spare 14-inch lengths of single ready with a fly attached to each, in case of accident; but, whatever accident may happen to either rods or lines, Rule No. 2 must be strictly adhered to. Mr. George M. Kelson's address is No. 13 Colville Mansions, W."

ROD-JOINTS AND REEL-SEATS.

BY DR. JAMES A. HENSHALL.

IN leaving the tentative and uncertain subject of the proper color of leaders for the more tenable one of rod-joints, we step at once upon solid ground. But after the able exposition and defense of the non-dowel joint by Messrs. Wells, Alden, "Esprit Fort" and others, there remains but little to be said by me, except in the way of corroboration.

If there were wanting any proof of the practical superiority of the flush, cylindrical, non-dowell joint over the tapered, dowel and mortise joint, we would find it in the fact that so many anglers, having the mechanical skill to construct their own rods, have discarded the latter for the former style of joints, as evinced by their articles in FOREST AND STREAM during the past few months. And, moreover, they all seem to have arrived at this determination and conclusion independent of each other. Many of the most valuable improvements and inventions have been made in like manner, each one supposing himself to be the sole inventor.

It is now twenty-five years since I made my first rod with flush joints, having at that time never seen or heard of a joint without dowels, and ever since I have been a firm believer in that style of joint. One of the specifications of the Henshall black bass rod is for flush, non-dowel joints, with short, cylindrical ferrules, and as so many of these rods have been sold during the past eight or nine years it has had a great tendency to introduce and popularize this form of joint, which is now also applied to many fly-rods to their great advantage.

I have often thrown apart the doweled joints of the old style rods in casting with both fly and bait rods, and have had them break near the lower end of the female ferrule in consequence of too deep a mortise at that point, but with the cylindrical non-dowel joint I have never had either accident to occur.

There is one point which I believe has not been touched upon by any of your correspondents; the principal cause of the throwing apart of the dowel-mortise joint. The ferrule, dowel and mortise being made tapering, the male ferrule and its dowel acts as a wedge, and the continual springing of the rod in casting tends to loosen this wedge and to eventually separate the joint, in the same way that we extract a nail by working it from side to side. This fact can be easily demonstrated by separating the tapered dowel joint by working it back and forth in this manner, with the hands close to the ferrules; but it cannot be done with the flush, cylindrical ferrule joint; to separate the latter it is necessary to pull or twist it apart, for no amount of springing it back and forth will loosen it. This fact renders nugatory and superfluous all locking devices, screws, cleats and strings which have been proposed to secure the joint and prevent its separation in casting.

Mr. C. F. Orvis, who was the first manufacturer to make the Henshall rod, was also the first professional rod maker I found who agreed with me in regard to the faults of the dowel-mortise joint, and the superiority of the other. He discarded the tapered dowel joint thirty years ago, his greatest objection to it being its tendency to throw apart, owing to the wedge-like action mentioned, and for that length of time he has used the simpler and better non-dowel joint.

Ferrules should be short and cylindrical. It is not necessary for the female butt ferrule to exceed two and a half inches in length, nor two inches for the second joint. The male ferrules should be of a corresponding length, say one inch, which will give all the "hold" necessary, and allow for a small space between the ends of the rod pieces when put together. The ferrule should be perfectly fitted to each other, in some such manner as that so ably described by Mr. Wells. The lower end of the male ferrule, and the button of the female ferrule should be protected by metal caps or disks soldered on, to exclude moisture, in split bamboo rods. Ferrules for wooden rods may be fixed in the same way, or the exposed ends of the rod pieces may be simply varnished. The ferrules should be fitted without cutting the wood, and a wrapping of silk put on at the ends for a finish. A good plan is to wrap on a guide or ring immediately below the female ferrules, so that the upper wrapping of the guide extends to the ferrule, which thus serves a double purpose.

Swell ferrules are unnecessary, and are neither so good nor strong as cylindrical and uniform ones. The ends of the ferrules may, however, be swaged into a hexagon form in split bamboo rods, to give a more perfect fit, without any disadvantage in other ways. Ferrules may be banded if the metal is very thin, which is apt to be the case with those drawn from German silver, which cannot be drawn so thick as brass. Ferrules should be affixed with shellac or cement instead of using the metal pin, which has a tendency to weaken the rod, and renders the removal of the ferrule more difficult to the angler for the purpose of repair.

The advantages of the non-dowel joint may be formulated as follows: 1. The ferrules being shorter, are considerably lighter. 2. The ferrules being shorter, stiffen the rod less at the joint and allow a more uniform bending of the rod. 3. The ferrules being shorter, are more easily put together and taken apart. 4. The ferrule being cylindrical, will not throw apart in casting. 5. The ferrules being cylindrical and fitting more perfectly, will not become loose and shaky by use. 6. There are no dowels to stick and bind after getting wet. 7. They are more easily repaired. 8. There is no mortise to weaken the rod. 9. It obviates the use of all locking devices. 10. The cost is less.

The best reel-seat is the old shallow groove cut in the wood, with reel-bands. It is lighter than any other reel fastening, and subserves its purpose better than any of the modern inventions. Any reel can be made to fit it in a few moments. If it is too shallow for the cross-bar of a reel, it is only necessary to deepen it with a gouge chisel or a penknife. If the reel fits too loosely, a piece of paper or card board placed under the cross-bar, tightens it. With solid metal reel-seats there is no remedy but by altering the cross-bar of the reel, which sometimes entails a good deal of labor and no little skill; and it may have to be altered a second or a third time to fit the metal reel-seats of other rods.

The solid metal reel-seat subserves no good purpose, and adds from two to four ounces to the weight of the rod. It is idle to say that the additional weight gives the rod a better balance—it should balance without it; or that the wood may swell (without it) and cause the reel to stick—if the groove is well varnished and the rod properly used it will not swell. The fact is the metal reel-seat is put on to make the rod "sell." It gives a rod a nobby, flashy appearance which pleases some, but old anglers are not to be caught with such chaff. If rod and reel-makers would conform to the standard sizes reel-seats and cross-bars, as adopted by the National Rod and Reel Association, it would save anglers a vast amount of trouble and vexation. Will they do it?

CYNTHIANA, Ky., June 10, 1884.

[In my article on "The Color of Leaders," in last week's paper, page 387, middle column, sixth line from the bottom, for "with leader or snell" read "without leader or snell."]

THE PUGNACITY OF QUAIL.—Toledo, Ohio.—In am inclined to the belief that we have still a great deal to learn and to unlearn about this beautiful bird. My friend Willis, of New Jersey, insists that quail in confinement will not show the slightest disposition to breed, owing to their jealous and pugnacious disposition, unless the number in the inclosure is limited to a single pair. It is not unusual, he says, in a state of nature for a male bird to pair with two females, but this condition of thing would cause serious trouble with caged birds. The knowledge that Willis does not possess about quail is hardly worth having, and I believe that in the main he is correct; but I have quite recently discovered a case where two male and one female quail have been living together most amicably for over a year—a clear and unmistakable instance of polyandry. Not only do these male birds never fight, but singular to relate both males during all the spring have been paying the most marked attention to the female, and both have received her favors impartially. The three birds were kept in a large wire cage about seven feet square and proportionately high, and as they are in a room through which there is constant travel, pay no especial attention to persons passing and repassing. The hen has thus far shown no disposition to lay. Will this hen now mate with a third cock, an entire stranger, if removed to a different cage and placed with him alone under more secluded surroundings? I cannot answer to-day, but perhaps I can later in the season. Her new mate, a very fine specimen of *Ortyx virginianus*, has been in confinement a year and a half, and is tamer than the average domestic fowl.—H. H.

A STATE SENATOR NABBED.—Manchester, N. H., June 12.—Inclosed find an item clipped from Manchester *Union*, which will show to some extent which way the wind blows regarding the game and fish restrictions in this State. I have heard it said many times that those "in the ring" always had what they wanted of either, early or late, in or out of season. Black bass have been caught and offered for sale at the markets here, and the open season is not here yet. The item runs: "A gentleman in this city has just received the following information from Wolfeborough. Fish Commissioner Hayes, while crossing Lake Winnipisecogee from Wolfeborough to the Weirs last Thursday morning on his way to Plymouth, to get trout fry to be distributed in the waters of the southern part of the State, discovered something that looked to him suspicious, and so took a boat, went back to the object and captured a trawl 723 feet long and equipped with 125 hooks, and three men, one of whom is a State Senator and a member of the Fish and Game League of Nashua, who was old enough, big enough and ought to know better than to have been engaged in such illicit sport. The violation will be punished to the fullest extent of the law. Much complaint has been made of illegal fishing on Winnipisecogee Lake. The spawning beds of the lake trout have been robbed, very much to the detriment of fishing in those waters. Hayes has fired the first gun and others will follow."—A. B. D.

SARATOGA LAKE.—Saratoga, N. Y., June 11.—I think very few people know what a good fishing ground this little sheet of water is. Although it has been fished for more than three-quarters of a century, both by legitimate angling and netting, the fishing is still good. The famous Saratoga Lake black bass, the necessary part of a dinner at "the lake," are still plentiful, and are as game as any fish that swims. I admit the sport of trout fishing, and am as devoted to it as any one; but I maintain that a two or three-pound bass fights harder and longer than any trout. Up to a year or two ago it was the practice of parties living in the large towns south of here to come up at evening with a large seine and at night drag the sand flats where the bass spawn, taking in some instances several wagonloads of these fish. This has been partly stopped, but seining is still continued, and large quantities are caught in fyke nets. If this lake could only be preserved as Greenwood Lake is, I am sure that in a few years the fishing would be very fine, as it still holds its own, and is as good as it was twenty years ago, according to all accounts. Can you inform me in what way the careful preservation of Greenwood Lake was attained?—SARATOGA. [Greenwood's protection has been by clubs of anglers, who have made it their business to see that the law is enforced.]

PASSAIC RIVER has been cursed with net fishers. The Passaic County Fish and Game Protective Association, of Paterson, sent a warden, June 9, and arrested one Joseph Durget, Jr., who runs a saloon on the island off Lincoln bridge. Durget was convicted of having drawn a net and was fined $24.48. His friends paid it for him.

CONEY ISLAND CREEK.—The Coney Island Rod and Gun Club, of Brooklyn, announces that there is good fishing now in Coney Island Creek and Gravesend Bay. Prizes are to be awarded to the members catching the largest striped bass in these waters during the months of June, July, August, September and October; also for the largest weakfish.

"WAWAYANDA" AND "TRUTHFUL JAMES" will try their luck in Canada this summer. They have an elysium of perennial bass somewhere in the woods up there, and will camp out.

RAINBOW TROUT.—Caledonia, N. Y., June 10.—Last Tuesday evening a gentleman from our village caught with the fly in the Oatka or Allen's Creek, a rainbow trout weighing four pounds ten ounces; it was a perfect fish in marking and colors and gave him great sport. He says that it was a full hour before he could land it. The fish was taken below a dam about two miles below the mouth of Caledonia Creek, the stream into which the rainbows were first placed on the Atlantic coast.—JAMES ANNIN, JR. Wellsville, N. Y., June 9.—In the summer of 1880 California trout were first placed in the Genesee River in this vicinity. Last Friday a California trout was caught at Shongo, eight miles up the river from this place, which weighed three pounds seven ounces. The fact is demonstrated that our foreign friends will attain a good size in these waters.—CLARENCE A. FARNUM.

WIND FISH.—New York.—Perhaps I can help "N." out as to the wind fish of the Hackensack. Two summers ago, while spending a few days at Rockland county, trying to take some pickerel, I heard a good deal about this fish, but could not get one. Not long after my return home two were sent me. I thought I knew them, for I had taken them in streams in Michigan while fishing for trout, and at my old home in Canada. I took the specimens to a friend in the FOREST AND STREAM office, who said I was right in calling one of them a dace and the other a chub. These two were not over three or four ounces in weight, but I have seen them as large as a half pound. I understand that the reason they were called "wind fish" was not because they "bit" best when the wind blew, but because of their large air bladder, or as the boys called it, "wind bag."—NIAGARA.

BASS AT ST. CLAIR FLATS.—Detroit, Mich., June 14.—I am glad to note that our Canadian friends at St. Clair Flats have stopped, or at least have endeavored to stop, the catching of black bass off the spawning beds, in or near Johnson's channel. For years, many Detroiters and others on this side of the creek, have regularly in May and early June taken enormous numbers of black bass from Johnson's channel. As the spawning season in those waters lasts until June 15 or even later, anglers should have had more thought. Within ten days several Canadian sportsmen have taken the matter in hand, and have politely informed parties fishing there that their laws prohibit the catching of black bass between May 1 and June 15, and their notifications have been the means of saving myriads of eggs and small fry. Good for the Canadians.—DELTA.

NEW JERSEY SALT-WATER FISHING.—June 14.—Weakfish have begun to run into the bays on the New Jersey coast. At Barnegat, fair fishing is reported. Sea bass are biting, and a number have been taken inside the inlet near the "old wreck." Have heard of but few sheepshead boated as yet. It is beginning to be the time for them to appear. No bluefish yet.—HOMO.

ANOTHER MOSQUITO REPELLENT.—The "Angler's comfort," manufactured by N. S. Harlow, Bangor, Me., is highly spoken of by those who have used it in their campaigns against the insects of Maine, the Adirondacks and Canada.

CYNTHIANA, Ky., June 10.—Black bass fishing has not been so good as usual in this section this spring, owing to high and cool water.—J. A. HENSHALL.

Fisheulture.

SALT AS AN AGENT FOR THE DESTRUCTION OF THE FISH FUNGUS.

BY PROF. H. J. RICE.

[Read before the American Fisheultural Association.]

THERE are very few persons who have ever had anything to do with the artificial rearing of fish; especially if the rearing is carried on in comparatively quiet and warm water; or who have ever had very much to do with fish in aquaria, but have been more or less exercised over the decorations and ravages of that very insidious and annoying vegetable parasite, commonly known as fish fungus, although it occurs, indeed, on many other objects than eggs and fishes. Many means have been employed for its destruction and innumerable efforts made to dislodge it from the tanks where it had obtained a firm foothold. Asphalt, tar, salycilic acid, salt and various other simple or compound agents of destruction have been employed, and while each and all of them have been pronounced beneficial, yet most of them are difficult to apply, and after being applied much care is necessary in order that the agents shall not be the means of doing that which they were employed to prevent; that is, cause the death of the eggs or fish experimented with. Of all the agents thus far employed for the purpose of destroying this fungus, or *saprolegnia*, common salt is, taking everything into consideration, probably the most useful, since it can always be easily obtained and quickly manipulated. But it is always well to bear in mind that with whatever agent the work is carried on, the agent will perform its part only when associated with vigilance, persistence and zeal on the part of the operator.

Having had occasion during the past season to make certain experiments in the direction of dislodging and exterminating this undesirable form of vegetation, which had secured too firm a hold in certain tanks and upon certain animals and fishes in the laboratory at Fulton Market, N. Y., I determined to try the effect of the continual use of a strong solution of salt, and to note carefully the results. The work was thus merely supplemental to what has already been done in this direction, and, so far as it goes, corroborative of such previous efforts. The animals upon which I experimented personally were goldfish of the Japanese variety, black bass and specimens of *Necturus lateralis*, or the mud puppy. I also induced Mr. Geo. Ricardo, fish warden of Bergen county, N. J., to undertake some experiments as to the efficiency of salt in destroying the fungus which collects so plentifully upon the trays and bunches of eggs in the smelt hatching operations. The experiments with the goldfish were begun during the month of January, and continued several months. The specimens operated upon were from a lot brought over from Japan and China in December by Capt. Jones, of the steamer Oxfordshire, and placed immediately upon their arrival in tanks of running water at the stand of Commissioner E. G. Blackford in Fulton Market. The fish had been very severely handled during their ocean voyage, many of them having large numbers of the scales knocked from their sides, evidently from being thrown against the sides of their vessel as the steamer struggled in the rolling waves.

From this cause, and undoubtedly also from the fact that the water into which they were placed was too cold for their warmth-loving constitution, they commenced to die, one by one, within a day or two of their landing on our shores. Those that died first were hardly more than still before the velvet-like plush of the *saprolegnia* spotted their bodies or fins, or, in some cases, literally enveloped them in a robe of white. Soon not only the dead but the living were similarly decorated and it became evident very quickly that if something was not done the *saprolegnia* would, before long, claim them all its victims, although it is hardly more than justice, perhaps, to state that the fungus in all probability was in these cases, whatever it may be in other cases, a secondary rather than a primal cause of death. While death was thus making sad havoc in the ranks of those of these beautiful fishes which were kept in the running Croton water down-stairs, those which I had taken, very soon after their arrival, up-stairs into the laboratory and placed in a small aquarium of moderately warm water, were getting along very nicely and were not troubled at all with the fungus. I then requested that four or five of those specimens affected with the fungus should be taken from the tank and sent up to me to be treated with a salt bath. I prepared the bath by placing three or four handsful of coarse salt in a small quantity of water and then heated it over the fire until the salt was all dissolved.

Cold water was then added until the whole was a temperature of about 60 degrees, when the fish were taken very gently out and placed in their new location. At first the change was not apparently agreeable, as they darted about in a furious manner, but some became quiet and were taken out after an immersion of about one minute and returned to fresh water, but not to the same from whence they had been taken. In the course of half an hour or an hour the fungus began to loosen from the body in quite large patches, showing that the connection of the hyphæ, or rootete, with the skin had been destroyed, and the next morning I picked out quite a large number of these discarded fungus flakes which the fish had thrown off into the waters during the night. In order to make sure that the hyphæ should be entirely destroyed, and not leave relics from whence new crops might be generated, I gave each fish two additional baths of the strong salt water, and until they were moved from their aquarium and injured at a later period I found no traces of fungus on any of them. It is true that in some of the cases experimented upon the salt water did not cure the fish, but the salt water certainly killed the fungus, and undoubtedly if the fishes had not been very much debilitated before the bath was given them, their lives might have been prolonged as in the case of some of the others. The black bass which was experimented with was literally loaded with a fluffy plating of fungus when it was first placed in the bath. It acted much in the same manner as did the goldfish, except that from its size and strength it produced a much greater commotion in the water. It was left in the bath about ten minutes and then replaced in the tank from whence it had been taken. The next morning the entire surface of the body looked as if a strong card had passed over it and had raked the fungus out into long filaments and strings and streams, ready to be pulled off with scarcely an effort. Two days after a second bath was administered, but while still more of the fungus was loosened, the parasite had evidently been too long at work, the hyphæ had penetrated too deeply and drawn for too long a time upon the tissues of the fish for it to recover, and in two days more it ceased to move.

The next animals to be experimented with were nine specimens of the mud puppy or *Necturus lateralis*. These had all been more or less injured about the mouth with the hook in their capture, and two or three had their tails badly mutilated. Some of them were very much matted with the fungus when they arrived, while others were only slightly attacked. They were all placed in the bath and the fungus was loosened or killed upon all of them, but the salt water had the effect, in the cases of those severely injured, of aggravating the injury, and by increasing the rawness of the wounds, prepared the field for a new crop of the fungus, since the water was full of the *saprolegnia* spores, ready, and indeed anxious to continue the old condition of affairs whenever opportunity offered. In such cases the new crop of fungus sprang up with a rankness and a velocity which was truly surprising, and if I had not known that the salt water would kill the fungus, I should have been inclined to think that in these cases salt water acted as a fertilizer for the hyphæ. I am inclined, however, to think that the true condition of affairs was that the salt water killed a part of the hyphæ, and at the same time rendered the wounded surfaces much more suitable localities than ever they were before for the growth of the fungus, and then when the animals were replaced in the fresh water, the spores, which were there in countless numbers, finding suitable territory in which to develop, took root, and together with the remnants of the old hyphæ, grew with wonderful rapidity. At any rate I succeeded in destroying the fungus only on those animals which were not badly wounded. The rest died.

In the spring of 1877, while engaged in studying the embryology of the smelt at New Brunswick, N. J., under the auspices of the Maryland Fish Commission, I found that one of the most serious drawbacks in the manipulation of the jars in which the eggs were placed was the collection and growth of the *saprolegnia* upon the trays and upon the eggs, especially whenever the eggs were much massed together, as they often were in clusters of the size of a large walnut or larger. With the arrangements which we then had we could not try the effect of salt upon this growth of fungus, but in my report to the Commission I expressed my opinion in favor of testing the salt-water bath, as soon as arrangements for its use could be made.

An opportunity to test this method with the smelt eggs did not occur until this spring when in talking with Mr. Ricardo, who was engaged in manipulating smelt spawn upon the Hackensack, I suggested that he should try the effect of immersing the small eggs in strong salt water, particularly such of them as had any fungus attached to them. The method employed by Mr. Ricardo in attaching the smelt spawn, which is similar to that employed by Mr. C. G. Atkins in Maine, some years ago, that is by taking blades of sedge or water grass and dipping them into the pans of milted spawn prevents to a great extent, if not entirely, the massing together of the eggs, since the rough surface of the blades allow only a single layer at most to adhere to the surface; the result is pretty even distribution of the eggs over the blades and not much chance for the attachment of the fungus except on the dead eggs and the dead portions of the grass. Still there always is a greater or less amount of fungus present, and very much in proportion to the greater or less flow of water over the eggs.

Acting upon my suggestion, Mr. Ricardo prepared some salt water, strong enough, as he said, "to bear up a potato," and placed some of the egg-bearing grass blades in it. He took those blades which had considerable fungus upon them, and after leaving the blades in the water for fifteen or twenty minutes, he took them out and found that the fungus had been killed so completely that it could be stripped from off the eggs like a slough, leaving the eggs nearly, if not quite as clean as when first taken. From that time on until the eggs hatched out, which was, I believe, a period of about two weeks, he gave them a bath every day or every other day, and no more fungus appeared, and only about five per cent. of the whole number failed to hatch. Every experiment which he tried seemed to show the advantage of the salt bath in the destruction of the fungus, and that little or no harm resulted to the embryo fish. In order to test the effect of continued immersion upon the embryo, he placed some ova in the salt water and kept them there for forty-eight hours. At this time they were all in good condition, and it was not until they had been kept constantly immersed for from sixty to seventy hours that the embryos were unfavorably affected.

Short immersions seem to have very little effect upon either the embryo or the adult fish, and, while there is a point beyond which we cannot safely go in our experiments with either the one or the other, yet of the two the embryo seems to be able to stand a longer immersion than the adult, especially than these species which are not anadromous. Short and moderately frequent immersions, then, will in all probability accomplish what is desired, so far as the destruction of the fungus is concerned. This, at least, seems to have been the case in my experiments, but it is much better, in every case where it is practicable to do so, to give this salt bath as soon as any fungus is discovered and before the hyphæ have penetrated very deeply into the tissues, for it seems to be beyond question that the *saprolegnia* is one of these parasites that causes tissue destruction, as I have seen in numerous instances the gradual extension of the velvety carpeting of hyphæ branches, from some minute wound on one side of the body of an animal, until the entire body was girdled. By taking the animal in hand early, and, in case there is no serious wound to be aggravated by the salt, by using a strong solution and using it for a short time and often, it seems to me that salt may be a valuable agent in the hands of those who wish to rid their aquaria or their hatcheries of what is often an intolerable pest. And above all must it be borne in mind, that when water is used that comes from rivers and lakes, like the Croton water of New York city, no matter how clear of fungus they may get their tanks or aquaria, the spores are in the water, and any wounds in the fishes or decaying or dead matter which may at any time afterward get into the water offer fertile fields for renewed growths, which can only be disposed of by a new resort to the salt wash.

THE OHIO COMMISSION.—We have the eighth annual report of the Fish Commission of Ohio. It opens with an account of the first breeding of fish in America by Dr. Garlick and Prof. Ackley. Sixty million whitefish eggs were in the hatcheries at Toledo and Sandusky at the time when the report was written. It is thought that the eggs of the black bass can be taken and hatched and better results obtained than when the fish are left to do their own spawning. The game question is touched upon and it is recommended that all duck shooting in the spring of the year should be stopped and also that no amendment to the game laws be acted upon until the same has been considered by, and reported to, the Fish Commission by the Fish and Game Committe. An excellent showing of work is made in the tables which give the numbers and places of the distribution of fry, in which, by the way, the pike-perch is miscalled "jack salmon." Extracts from Henshall's "Book of the Black Bass" are given to show that there are two species, but sad work is made of names and technical terms in the nomenclature, due to careless proof reading. Prof. Charles Dury contributes an article on the late Fisheries Exhibition at London; and Mr. C. W. Smiley one on the carp.

☞ **No Notice Taken of Anonymous Correspondents.**

G. A. C., Canton, Mo.—Your gun is of English make.

C. G., Elmira, New York.—The recipe was given in our issue of Feb. 28, 1884.

W. A. R., Portland, Me.—We think that there was such an article, but are unable to find it.

J. H. S.—Will you please inform me how to raise young crows? Ans. Feed them as you would chickens.

W. A., Bay View, Wis.—1. Some people eat red-winged blackbirds. 2. The use of the grease in gun wads is as a lubricant.

G. L. O., Boston, Mass.—1. The measure of shotgun bores is an arbitrary one. 2. For rifles see our advertising columns.

READER, New York.—We advise you to take your gun (for polishing the stock) to a gunsmith. Have written you at address given.

YANKEE.—The name Manitoba is pronounced with the accent on the last syllable, Manito-ba, the final a having the sound of a in father.

E. F. F., New York.—Where can the most profitable hennery be seen near this city? Ans. Ask some of the Washington Market poultry dealers.

J. H. R., Pottsville.—Where is a good place for camping out in Pennsylvania? Ans. Go to the headwaters of the Sinnemahoning in Tioga county, Pa.

I. S. W., Providence.—Is the book "Wing-Shooting (advertised in your book list, by "Chipmunk") the same as published by T. G. Davey, Ontario, which formerly sold at $1.00? Ans. Yes.

R. F. B., Troy, N. Y.—We can supply you with a copy of Babcock's compilation of the New York game laws, price, 25 cents. The law permits killing of song birds to be used as natural history specimens.

E. H. K., Elmira, N. Y.—The charge of 3 drams powder, 1 ounce shot is better adapted to the 12-gauge gun than to the 10-gauge. To determine which gun will give the better pattern and penetration with that load, try them.

C. W. S., Hudson, N. Y.—1. The open season for wildfowl in this State is from Sept. 1 to May 1. 2. Song birds may be shot for natural history purposes. Game birds may not be captured, save in the open seasons prescribed by law.

MAC, Harrisville, Mich.—Which English weekly paper gives the best English rifle news, scores and general rifle matters? Ans. *Volunteer Service Gazette*, 121 Fleet street, London. Subscription price about $5 we presume.

J. M. E.—Your correspondent "J. M. E.," May 15, 1884, would probably find the "Manual of the Vertebrates of the Northern United States," etc., by D. S. Jordan, Jansen, McClurg & Co., publishers, price $2.25, of considerable utility.—W. H. S.

H. L. C., Cleveland, O.—The "Adirondack cottages for the cure of all pulmonary diseases" are at Saranac Lake. Write to Dr. E. L. Trudeau, at that place. We understand that the institution is endowed and the expenses of patients are light.

W. C. M., New York.—I wish to use the star wads to save the trouble of crimping my shells, but it has been suggested to me that they would be likely to scratch the gun barrels. I use a choke-bore. Will you kindly give me your opinion on the subject? Ans. They will not scratch the gun barrels.

D. F. E., Boston, Mass.—We cannot tell you where you will find "good partridge and duck shooting with deer and good fishing, within 200 miles of New York." There are few favored spots where one can kill all sorts of game at a single shot. For ruffed grouse try the interior of Connecticut. For deer, go to Maine or the Adirondacks. For ducks, try the south side of Long Island.

G. C., Worcester, Mass.—Where can I get a pocket map of Hancock and Washington counties? Ans. There is a Hancock county in each of these States: Ga., Ill., Ind., Iowa, Ky., Me., Miss., Ohio, Tenn. and W. Va.; and a Washington county in Ala., Ark., D. C., Fla., Ga., Idaho, Ill., Ind., Iowa, Kan., Ky., La., Me., Md., Minn., Miss, Mo., Neb., N. Y., N. C., Ohio, Or., Pa., R. I., Tenn., Texas, Utah, Vt., Va. and Wis. Which State or Territory do you refer to?

W. G.—If my question is not prompted by stupidity will you kindly answer whence are the terms No. 10 gauge, No. 12 gauge, etc., as applied to the caliber of shotguns. Ans. The numbers were originally used to denote the size of the bore by stating the size of the ball adapted to it, and the ball was designated by the number required to make a pound. Thus, a 10-bore was a gun which would receive a leaden ball 10 of which would weigh one pound, or, as it was said, would run 10 to the pound.

B. B., Boston.—1. Where could I buy a first-class male donkey (for mule raising) and what would be about the cost? 2. Where are the principal mule farms in this country? Do you know of any in the neighborhood? 3. Would you consider the South Carolina coast a good place for mule raising? Ans. 1. Probably no jack suitable for your purpose in this neighborhood. A good one would probably cost you anywhere from $500 to $1,000. Write to Graham & Grannis, Poplar Plains, Ky. 2. Principal mule farms in Kentucky and Missouri. We know of none in this vicinity. 3. It would be an experiment.

AMATEUR.—Wortendyke, N. J.—Yesterday, while taking a walk, I found two birds under a pear tree on their backs. One was dead, and the other, although its toes were turned up, seemed all right. There are no marks of shot on either, and I cannot account for their prostration unless it was the result of a fight. I can find no one about here remembers having ever seen a bird like it. I have the live bird and I mail you the other. Please inform me what it is. Can you offer any explanation of their position as I found them? Ans. The bird is the cedar bird or cherry bird (*Ampelis cedrorum*), a widely distributed and abundant species, which breeds with us in summer and also often spends the winter here. We cannot account for the position of the birds.

The Kennel.

FIXTURES.

BENCH SHOWS.

Sept. —.Bench Show of the Philadelphia Kennel Club. Mr. P. C. De Saque, Secretary.

Oct. 8, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 14.—Non-sporting Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Charles Lincoln, Superintendent.

AMERICAN KENNEL REGISTER.

OUR little monthly contemporary, the *American Kennel Register*, continues to meet with great favor on all hands. The best evidence that it was needed is seen in the anxiety of breeders and owners to register their stock. The June number runs up the entries to between 1300 and 1400, and the pressure for entries is so great that this month's *Register* is again enlarged to twenty pages. The *Register* started fifteen months ago, as a twelve page paper, but for several months now it has been regularly printing sixteen and twenty pages, which is certainly a good deal for the merely nominal subscription price—one dollar. It is a complete record of all events interesting to dog-owners and breeders.

POINTERS AT NEW YORK.

Editor Forest and Stream:

Mr. Cornell's reply to my criticism of the pointers at the New York show afforded me much pleasure and considerable merriment. I have for months wished to have a little talk about pointers with the Westminster Kennel Club's genial secretary, whose knowledge of the subject, though limited, may at least be said to be varied. Unfortunately, Mr. Cornell does not appear to have read my letter carefully. If he did, he must intentionally have misconstrued its meaning and my motives for writing it. I do not remember suggesting to pointer exhibitors the advisability of lashing themselves into a rage and forthwith proceeding, in a rambling style, to attack either me or my dogs. What I said was that I would be glad if any one could point to errors of judgment on my part, and I added that "impartial" criticism of our pets is conducive to improvement. My report was a careful criticism of dogs, not their owners. Mr. Cornell's reply is an untrustworthy advertisement. One part of his letter reminds me of an amusing little incident which occurred at the dog show recently held under the auspices of his club. As I was bringing my first prize setter puppy out of the judging ring, somebody asked, "Who has won?" The reply was as follows: "Mason again, but we couldn't stop him." No, could not prevent it, and cannot now make me lay my pen aside until justice, or some sense of fair play, is discernible at the combinations very appropriately termed "bench" shows.

Mr. Cornell first states that in his opinion Meteor was far and away the best dog in the large champion class. Mr. Cornell had him out, and Mr. Cornell handled him. Good judge, Mr. Cornell—understands a pointer—once advocated the claims of lemon and white pointers, after that favored the liver and whites, now breeds them black and white. Once wrote would not own a pointer by Faust so long as Sensation was in the stud—sound judgment. A great believer in variety; owns the blood of almost every pointer in the world, good and bad, and fancies that a conglomeration of the bad is the necessary quantity out of which to compose that which is good. Well, after Mr. Cornell had had the dog out, he discovered that he had a bad head with no stop "below" the eyes, and little depth of skull. The snipy muzzle, the high set on ears, the badly-carried tail, the short back and the long legs Mr. Cornell failed to see. He simply concluded "his one important fault is that his head is not handsome." Still he is the "type of dog" Mr. Cornell wants to see noticed at a "bench show," as he is fit for bench and field. I should like to see "pointers" win prizes at "dog shows;" therein lies the difference. Now, if Meteor has little depth of skull, he has clearly no brain capacity and consequently no brains. How then, in the name of common sense, can he be fit either for field or show purposes? Perhaps Mr. Cornell or some other luminary of the law connected with his club, will explain this. Does Mr. Cornell still advocate the breeding of insipid, senseless-looking, wishy washy animals? I thought he had changed his views when I noticed that he and his club were carrying out the advice I gave them twelve months ago, and were breeding to dogs outside their kennel.

There is another question I wish to ask of Mr. Cornell. The Westminster Kennel Club has for years advertised in the public stud a dog named Sensation, whose value is estimated at the reasonable sum of $12,000. I found Sensation to be Don, a dog which when in his prime was offered for sale by a breeder and a judge for £15 15s. (about $75). I refused to take him at the price, as did every other man who has had experience with the breed. Finally he came to this country, and with marvellous rapidity his value increased in proportion to the puffing administered, until it reached the modest sum I have just quoted. He was never a show dog, and on one occasion I remember his winning second prize at a little Saturday afternoon show held in Oswestry. The first prize, I believe, was worth ten shillings ($2.50), the second, five shillings ($1.25), and the third, half a crown (60 cents). Can Mr. Cornell deny that for years this dog was advertised and lauded to the skies as no other dog ever was? And what is the result of this to-day? Look round one of our dog shows and see! I am not digressing, neither will I be driven by personalities or abuse from the question at issue. Is it not possible to misrepresent two dogs equally as well as one? I think so. Is this not being done with Bang Bang? Time will tell.

If Sensation is a good-looking pointer how can Meteor claim to be a pointer at all? If Meteor is the correct type honest men can hold but one opinion. Nobody can deny that Sensation is a very long cast dog, short on the legs with a round barrel, whereas Meteor is leggy and short in the back with a head different from anything I have ever seen on a pointer, and altogether different from Sensation's. I think pointer breeders should know why Sensation was ever allowed to be placed in the stud as a pointer if Meteor is fit for bench and field. I ask the question in their behalf. Mr. Cornell will, perhaps, kindly clear away the veil from before our eyes. My argument is that neither Sensation nor Meteor is a show dog. How could I consider them such when Wagg, Beaufort, Bang, Faust, Bow, Don II., Sancho, Graphic, Bang II., Rap, Belle, Luna; Prude II., Bow Bells, etc., are or were pointers, and have been proved to be such, not by men who never bred a good one in their lives, but by authority. If influence is allowed to alter the type of dogs to suit various owners I say the sooner dog shows cease to be held the better.

Mr. Cornell appears to have taken offense because I said that Bravo was the gentleman of the small-sized classes, and should accordingly have won the sweepstakes. I did not allude to Bang Bang, for I thought it pleased Mr. Cornell to win a prize under the judges appointed by himself, viz., Mr. Sterling, of pointer "fame," Mr. Higgins, a breeder of setters, and Mr. Tracy, the W. K. C.'s artist. I certainly did not attach much value to a prize won under such conditions, and perhaps I did not sufficiently appreciate the club's honest endeavors to have the prizes awarded to the best dogs. I am now told that Major Taylor was not asked to judge the pointers on account of his having expressed the opinion that Bravo is, as I say he is, a much better dog than Bang Bang. In defense of my criticism I will now endeavor to show Mr. Cornell why I consider Bravo superior to Bang Bang. It is quite as easy for me to support my opinions by sensible argument as it is for Mr. Cornell to refute my statements by no argument at all. Mr. Cornell tells us that Bang Bang beats Bravo everywhere excepting in hocks, whereas I most emphatically dissent from such a statement, calculated as it is to do much harm. Mr. Cornell possibly intended to say that Bravo beats Bang Bang everywhere excepting in muzzle. If he did, he was right or very near to it. Bravo, as I have already written, is decidedly weak from eye to nose, and is a trifle round in barrel. His legs and feet are exceptionally good, he has a nice clean neck, good quarters, and a well-placed and well-carried tail. I freely admit he is not quite the type of dog I like, but he was the best shown and should have won easily.

When Mr. Cornell tells us that Bang Bang is the most strikingly handsome pointer in America, we either refer back to Sensation, look into the glass to see if we are out of our swaddling clothes, or imagine ourselves to be spending the summer months at Babylon, Long Island. Bang Bang is very heavy in head, he has the shortest neck I have ever seen on a pointer, and is very throaty. Most large pointers when they get to be four or five years old grow throaty, but no excuse can be made for a small-size three-year-old dog. He has fairly good shoulders, and though some people object to his back, I like it. He has good forelegs, with plenty of bone for a little dog, and then you have finished with him. Besides the faults enumerated above, his feet are too large, he is faulty in the stifles and hocks, has no second thighs, and possesses a very coarse tail, which he carries *à la* foxhound. His nose and eyes are black (serious fault). "The Book of the Dog" says, "The nose must be large and moist, not black. A black nose is an especial blemish in a lemon and white dog." In regard to the eyes, the same authority says, "The color depends on the color of the dog, and are, therefore, either dark or light as the case may be." Besides these faults, the existence of which nobody who has seen the dog can deny, there is something far more importance to breeders. A little something, which, in my opinion, Mr. Cornell ought to have made public long ago. Especially so when he and his club assume to have the welfare of the breed at heart. Bang Bang gets black and white puppies from almost every bitch bred to him, and I am told that the Westminster Kennel Club has advised the lucky owners of such stock to put it into a pail of water, ank keep only the lemon and white and liver and white puppies. I will not at present bring into discussion the correctness of Bang Bang's pedigree, for I have a good deal of regard for the gentleman who bred him. But there is a screw loose somewhere, without doubt. My opinion is indorsed by a well-known English breeder of pointers, who writes me as follows: "Bang Bang did win first prize, but the class was a wretchedly bad one. The opinion here is that the American who paid £50 for him got his fingers well bitten. The dog has another fault besides those named by me." Is it an honest endeavor to improve our pointers to recommend in the public stud such a dog, simply because he is a fairly good field dog and is owned by the Westminster Kennel Club? I think not.

When I formed my criticism of the pointers at the New York show I passed over my own dog, as I did not think it in good taste to express my opinion of him. I therefore simply referred your readers to my notes on the dog in these columns before I purchased him. I do not now propose to advertise Beaufort. Those who have seen him know what he is; those who have not seen him are not very likely to be led away by beginners or individuals known to be prejudiced against his owner. My opinion expressed in this paper twelve months ago that "America can boast of having bred Beaufort, who is in my opinion the best pointer living," has been indorsed by every judge of pointers who has seen the dog, without one single exception. Mr. Cornell now considers Beaufort's legs crooked fore and aft. Yes, Mr. Cornell, his hindlegs are crooked, and pity my ignorance if you like when I place upon record a confession that I like to see a sporting dog with crooked hindlegs. Grand judge of pointers Mr. Cornell, teaches one so much in a short space of time and at such little expense. Does Mr. R. C. Cornell expect any sensible person to believe that I—who am a stanch advocate for good legs and feet, I, who time after time have urged breeders of sporting dogs in this country to give more attention to legs, feet and bone than they were doing, I, who never in my life have conferred honors upon cripples—I paid the longest price ever paid by an Englishman for a pointer, and the dog I purchased is crooked fore and aft? It is scarcely worth my while to refute such reckless statements, for those who have seen Beaufort are aware that he stands on about the grandest forelegs and feet ever seen. What shall we hear next, I wonder? I am well aware that it causes Mr. Cornell a good deal of uneasiness to know that a member of the Westminster Kennel Club, and the best judge in the club, is breeding to Beaufort, and considers him the best-looking dog he has ever seen. It must be equally galling to Mr. Cornell to think that the club's breaker, Mr. Luke White, is breeding to Beaufort, and that he has told me he has never seen a large pointer that could equal him. In the face of these "facts," and seeing that the name of Beaufort's owner is written with blood on the pages of the great account book at Babylon, is Mr. Cornell's attack not ill-timed—a failure?

If Mr. Cornell writes what he believes to be true of Beaufort, he acknowledges his ignorance and utter inability to understand the first and most important attributes of the breed. He does more than this, he holds himself and his club up to ridicule. I have before me here on my desk a letter from a gentleman in which he states, and will swear to it, that Mr. Cornell and a friend desired to purchase Beaufort for $500 at the Washington show, fifteen months ago. What is more, they engaged a gentleman whose name is familiar to all breeders of pointers to assist them in getting the dog. Mr. Nixon refused to sell at the price and acted wisely, for such a dog would be a gift at the money, not only for show purposes alone, but for stud purposes. He is getting better stock than any pointer living to-day, and is the best sire I have ever seen with the exception of old Bang. I am importing some bitches to cross with him and I hope to be able to show Mr. Cornell that I can breed good-looking dogs and raise them if the W. K. C. can not. It is a pity Mr. Cornell and his club did not succeed in purchasing Beaufort, for they would have been able to say that they owned a good-looking dog, the first they ever did own. As it is they must plod along, honestly endeavoring to show us the importance of establishing a new type of "black and white dogs." This may be successfully accomplished when they have the new dog association well in hand, and can over-ride kennel clubs and dog shows throughout the country.

Mr. Donner must excuse me from entering into a discussion about dogs with him. Though his letter was such as one expects to see from this gentleman, and stood out in broad contrast from that of Mr. Cornell, I really cannot argue with those who when in the capacity of judge have awarded the highest honors to cripples. I am perfectly sure that after what I saw on that memorable occasion when Mr. Donner judged the setters at New York, our ideas about the legs and feet of dogs are altogether at variance. Why Mr. Donner now wishes us to understand that the legs and feet of horses are similar in formation to those of dogs, I cannot tell. What a charming picture a horse would present with a set of legs and feet under him such as are to be seen on Mr. Donner's beau ideal of an English setter.

Mr. Donner is a member of the W. K. C. He wrote to strengthen Mr. Cornell's letter and indorse Mr. Sterling's decisions. He failed to do either one or the other, but he did indorse public opinion that Mr. Sterling is either a very partial man or knows nothing whatever about dogs. Let us be charitable and incline to the latter opinion. In his attempt to show my criticism of his bitch to be incorrect, Mr. Donner writes: "She (Fan Fan, winner of second prize) has intolerably bad feet; in fact I think a rooster has better feet, at least for the purpose of sitting on the fence." What do breeders and exhibitors of sporting dogs think of a "judge" who awards prizes to animals with worse feet than a rooster? And what do they think of the club that indorses him?

CHARLES H. MASON.

TOMPKINSVILLE, S. I., June 14, 1884.

Editor Forest and Stream:

Just a few words on "A Breeder of Sporting Dogs'" criticism on color. There is a saying that "a good dog is never of a bad color." Just so with Bang Bang. Mr. Cornell finds him the most strikingly handsome dog he ever saw. Your correspondent thinks he should be disqualified because his nose is black, and refers to Stonehenge and Vero Shaw. But Stonehenge doesn't support him unless in some volume I have not at hand. In his "Dogs of the British Islands," he says: "In color (value 5) there is little choice in point of fashion between the liver and lemon and white, after them come the black and whites," etc. Nothing about black noses. Vero Shaw gives it as his personal opinion that a black nose should amount to a "disqualification," yet he frankly admits that "authorities of position" differ from him. He allows nothing for color in his scale of points. Yet despite Vero Shaw's views, fortified as they now are by your correspondent and Mr. J. H. Phelan, Bang Bang won first at the Crystal Palace (England), the only time ever shown abroad. He has been once shown here for general competition, and then in very bad condition, and though defeated for first place, the judge did not "disqualify" him. Only once besides has he been judged, and that in the contest for the sweepstakes when under Messrs. Sterling, Higgins and Tracy, he again won. Isn't it just possible that your correspondent may exaggerate the importance of that black nose?

Let me add that lemon and white bitches bred to him throw lemon and white or orange and white pups, and liver and white bitches, black and white and liver and white. I have twice bred a liver and white bitch to him and shall do so again, and until I get advice of greater importance than that of your above-named correspondents, I don't think I shall drown the black and white ones.

ELLIOT SMITH.

NEW YORK.

Editor Forest and Stream:

Under the heading of "Pointers at New York," in your last issue, there appear such extraordinary comments, not to say criticisms, that I venture to say a word to the "Breeder of Sporting Dogs," who seems too modest (?) to sign his name, on the part of the apparently unfortunate and misguided Westminster Kennel Club.

He expresses surprise at "Mr. Cornell's remarks wherein he states that Beaufort's legs are extremely bad, being crooked both fore and aft." My natural inference is that he has never seen the dog, and his surprise is that the dog should have been so freely (I use the word advisedly) advertised in the stud. As to the remark, "All large dogs are throaty," would not this axiom (?) be better in heavy type at the head of your kennel page?

I would like, while not wishing to go into any controversy, to say, in referring to Beaufort that, while not ignoring his very many good points, from which I do not in the least wish to detract—and I do not know Mr. Mason personally—the dog's fore feet are badly put on at the pasterns, making him pigeon-toed. His hindquarters and legs curve like the wishbone of a Rhode Island turkey. His stern is, in "show condition," brought to the finest possible shape, but the bend in it cannot be eradicated once he is away from the handler. His body and head are particularly good, but to bear the criticism of judges at any show let us try and produce something that can go alone.

When Mr. Cornell says he is "stilty" I think he is wrong, because stilts must at least be straight, and even the clown in the circus has never ventured on curved ones.

As to Bang Bang, I prefer to let some one else criticise him, as I bought him for the W. K. C., and as his chief fault seems to be an occasional black and white puppy in a litter I must confess that I did not know that that color was so thoroughly unpardonable a fault. His mother, Princess Kate, was black and white, and a rare good one she was. His daughter Lingo succeeded in pulling off the puppy stakes at Shrewsbury this year, and perhaps a black and white one may yet make a mark here, as they have often done on the other side of the water.

G. DE FOREST GRANT.

Editor Forest and Stream:

Allow me a few words in reply to the letters about pointers at the New York show, which appear to me to contain more personal allusions to myself than to the dogs under discussion. As to the challenge made in one of these letters, I have to say, as I have before announced in the sporting press, that the Westminster Kennel Club would take no notice of these windy offers.

We put our dogs in open competition at the bench shows and field trials, and get our records fairly and above board. These gentlemen of the Knickerbocker Kennel Club with a wonderful unanimity hurl at us the dreadful accusation that Bang Bang throws black and white pups. So he does frequently, and remarkably handsome they are too. Two were very highly commended at the last show, and well deserved the cards they got. This does not indicate that the pups trace back to a coach dog, or whatever it was that Mr. Appold showed to be the progenitor of the illustrious stud dog of the Knickerbockers of New Jersey. Bang Bang's dam is black and white, and the dog has a legitimate right to his dark points.

This is what "Wildfowler" says in the *Shooting Times* of May 23 last: "Princess Kate, Bang Bang's mother, we ('Wildfowler') shot over for a season, and a better bitch was very hard to find." This is published with a fine picture of our dog, and a half column devoted to his achievements and pedigrees

One word more and I hope not to bore you or your readers for many a week again. J. H. Phelan says, "Something must be done for bench shows. It is time that dogs, not owners, were judged." I have read those very words once before, and from another source, and I say that this is an outrageous assertion and a vile aspersion of our judges. "Why does not Bang Bang win prizes under some other judges than those appointed by the W. K. C.?" I am asked, and I answer that he does. He won the first prize at the Crystal Palace, the only time shown in England, and you see what Mr. Munson says of him at Cleveland, "As a stud dog Bang Bang is a failure." His daughter, Lingo, has just won in the field trials at Shrewsbury, and his son, Master Bang Bang, has just won first in a class of twenty-seven heavy-weight pointers at Antwerp. Mr. Lort judged the class, and the *Live Stock Journal* declares that "this was an exceedingly fine lot."

In this country the dog has scarcely had a chance to prove his merit as he has not yet been here a year.

ROBT. C. CORNELL.

Editor Forest and Stream:

In your two last numbers I find letters from several gentlemen, all claiming to know as much or a little more about pointers than Mr. Sterling or anybody that does not see fit to agree with them that Beaufort is the best pointer in America. After reading so much from the pen of Mr. Mason and the many admirers of Beaufort, I had made up my mind to see the model pointer, but am sorry to say I was very much disappointed on seeing him at the late New York show for the first time. I was told by a number who had seen him at Washington that he had changed very much, and that they were very much disappointed in him on this occasion, as he was too fat for show or any other purpose After giving him a good examination, I came to the conclusion that he was a good

looking big dog with a fair head and good markings, but not what I want for a pointer dog.

Mr. Dorsey says: "Have we been worshipping an idol so clumsily defective as this? Our ignorance has certainly been pitiable, and kindly Mr. Cornell desires to remove the scales from our eyes." I would advise Mr. Dorsey, now as the scales have been removed, to keep them clear, and if ever he sees Meteor or Bang Bang to look them well over and try if he cannot see the difference between a cart horse and a thoroughbred.

The gentleman who signs himself "A Breeder of Sporting Dogs" has seen fit to belittle Mr. Cornell's judgment of the pointer by referring to Stonehenge and Vero Shaw, and has displayed as much ignorance as any of the would-be judges. He says: "The first thing that struck me as I was examining him [Bang Bang] in his stall was his black eyes and black nose. Is this a charming attribute of a lemon and white pointer?" In order to take the scales from his eyes I will say, in the first place, that Bang Bang is not a lemon and white dog, but is a dark orange and white, and when wet has more black spots than any other on him; besides, he came from black stock on one side, as his dam was black and white, so it is not surprising that he should have black on him or that he should get black and white pups; and, again, if he is not color blind and will go and look at him again, he will find that Bang Bang has about as handsome soft brown eyes as any dog he ever looked at, and if he only saw him as he lay in his stall, as he represents, he had better look him over before going into print, as he had a blanket on about all the time in his stall, and no man can judge a dog under those circumstances. I am afraid that Mr. "Breeder of Sporting Dogs" has so much Beaufort in his eyes that it was all the pointer dog he could see.

Mr. Geo. L. Wilms's bitter remarks to Mr. Cornell I think are all uncalled for when he says, "Mr. Cornell trys to belittle Knickerbocker and Beaufort and supports Mr. Sterling's most erroneous judging." I tried to get a good look at Knickerbocker, but was not allowed to take him out of his stall, and as he had a blanket on most of the time, could not see him only when in the ring, and liked him better than Beaufort, but think Mr. Sterling showed good judgement in giving the prize to Meteor over them, as they are both too clumsy and are not to be compared with Meteor any more than a cart horse to a thoroughbred. As Mr. Mason has explained all the faults of the dogs shown against him, I will not paint any good or bad for any of them, but am inclined to think when Mr. Wilms says that Bang Bang has a short and throaty neck he leaves off judgment, as I defy him to show a cleaner neck and throat on a pointer. He also says "that he must admit that his tail looked nice at the show, but when he saw him before, the abundance of coarse hair and the carriage of that appendage was most marked, besides does he think black nose and eyes the right color for a lemon and white dog?" Now, as to his tail, it was natural and had not been clipped or sandpapered as some of the famous or would-be famous pointers I saw at the show were, and his neck had not been soaked in anything to shrink it up as some I saw there, and when he went into the ring he was a natural dog without any faking. That I can swear to, as I took him there and no man in the club had seen him for three weeks or more until the show opened.

I must agree with Mr. Cornell when he says Bang Bang is the best looking pointer dog in America. I will say to Mr. J. H. Phelan, "Where ignorance is bliss, 'tis folly to be wise," and if he thinks Bang Bang is a failure as a stud dog and produces bad pups, I will show a pup eight weeks old against any he can produce of Beaufort's, the same age, for any reasonable amount or a piece of plate as he prefers, and if the club will allow me I will make the race against Beaufort with Bang Bang for any amount I am able to raise, and as he says, "Mr. Orgill is one of the most successful exhibitors and breeders of this country, he might not want to decide," I will name as a man to judge, one I think as capable as any in this or any other country, John Davidson. As he has never seen Bang Bang or Beaufort he will be as good a man as could be found, and one who will give the best dog the award. I have showed under him a number of times and he never placed one of my dogs, yet I give him credit as being the best judge of a dog I have ever met, and should we be able to come together with the dogs I hope that such a man will be the judge so as to have it settled which is the best pointer.

As Mr. Phelan thinks Mr. Orgill the most successful exhibitor in America, I will say that Mr. Davidson has given as many of his dogs prizes as any one that ever judged them, so I don't see why he will not suit to judge such a race as this. If Mr. Phelan or any of the above think Beaufort is the best pointer in the field, I will be pleased to name a number against him on one, two, or as many days as he or they wish to run, and I think Mr. Munson would be pleased to give them a chance at Meteor at any time. One question I would like to ask Messrs. Mason, Phelan and others, why they do not find fault with the judge who gave Mr. Mason's mastiff first prize, when he ought to have sent him out of the show if they wish to make bench shows improve, and not keep harping on the pointers, as I fail to find but a very few who are dissatisfied with the awards given by Mr. Sterling. To Mr. Ingersoll's question whether Mr. Mason had sent out any more of those protest letters, will say, to my surprise, about one week after the show, I received one, the same word for word, and was not pleased with it. If any of the friends of Beaufort wish to accept any of the above offers they can do so by applying to

T. M. ALDRICH.

MANTON, R. I.

Editor Forest and Stream:

I believe Mr. Cornell is something of a yachtsman, and that may account for the expression he used in his letter when he said Beaufort's legs are "not straight fore and aft." I am not a yachtsman, and what is more to the point, perhaps, I never owned a pointer and am never likely to, but I would like to get hold of Mr. Cornell's meaning. Will he kindly explain?

I can understand a sheet being straight fore and aft, or a boom in the same position, but legs are more like masts, and I don't see wherein the application of the term applies to masts. Possibly it is my ignorance, but all the same I am puzzled and I want to know.

In view of Mr. Cornell's explanation in your last week's paper, will he also kindly supplement that by stating which is the part of the dog's leg he refers to when he says Beaufort's hocks are bent. There seems to be a wide divergence of opinion as to the hock of a dog. Does Mr. Cornell mean the bone from the hock joint to the foot? If so, how is it bent?

PUZZLED.

NEW YORK.

Editor Forest and Stream:

In your last issue appears a letter from Mr. John W. Munson, in which he claims the privilege of saying a word in favor of the pointers in his kennel only, but abuses this privilege by slurring dogs bred by others. His reference to Beaufort I am not called upon to notice. No doubt Mr. Mason will take care of that. In reference to my own, he says: "I don't think a pointer will ever be bred in America except by chance from the Glenmark and Girl and Icicle and Lily and similar mongrel breed that will approach the true pointer type of Meteor and Bang Bang. Of course not. Mr. Munson's vanity would not let him think that others can accomplish (except by chance) what he hopes to accomplish in the "day when it arrives," and he firmly believes "the day will arrive," and he is going to be "so proud." Of what? "Winning prizes with dogs of his own breeding?" He admits the future holds out to him what we have accomplished long ago. For Mr. Munson's benefit I will state that the Glenmark—Girl progeny are field dogs, true to the pointer type and have been winning prizes all these years. This the height of his ambition! As he seems ignorant of these achievements, I will call his attention to this progeny that never yet "chanced" to be any but true to pointer type. Of the first litter Knickerbocker won first at Boston and champion at Ottawa, New Haven, Washington and Toronto, besides specials. Glenwood was he. and the following year won second prize at New York. Snowflake won third prize and repeated it the next year at New York. Glendale was he. at New York and shortly after lost. Flirt, probably the best bitch of this litter, her owner has never shown, as also Jean, but who was represented by her son Craft (vhc. at New York) and daughter Lady Bang (first and special at New Haven). Of her last litter but one was raised, Lennox, who won second at New Haven. So you see, Mr. Munson, that this Glenmark—Girl stock is leading where you hope to follow.

There is another part of Mr. Munson's letter to which I wish to call attention, and that is his allusion to Mr. Sterling's being interested in the dogs he (Mr. Munson) exhibited at the late New York show. If there have been any reflections printed in the sporting papers on this subject it has escaped my observation. As Mr. Munson has introduced this matter we would be pleased to hear further from him about it.

R. T. GREENE.

JERSEY CITY.

MR. GEORGE K. REED'S GORDON SETTER DOG "FLASH."
Winner of Champion Prize, New York, 1884.

A PROTEST.

WE, the undersigned exhibitors and breeders of pointers, request you to place on record in the pages of FOREST AND STREAM our disapproval of the awards of Mr. E. C. Sterling, at the New York dog show, held in Madison Square Garden, May 6, 7, 8 and 9, 1884:

Allerton, David, 160 Broadway, New York city.
Amory, G. W., 196 Beacon street, Boston, Mass.
Baltimore Kennel Club, Baltimore, Md.
Bringham, L. F., Jersey City, N. J.
Clarkson, Wm. H., South Orange, N. J.
Dorsey, T. B., Baltimore, Md.
Dwyer, T. H., New York City.
Greene, R. T., Jersey City, N. J.
Halstead, A. E., Moncton, New Brunswick, Can.
Heath, Charles, Newark, N. J.
Hepsley, William, Jersey City, N. J.
Knickerbocker Kennel Club, Jersey City, N. J.
Lamb, Richard, 59 Carmine street, New York city.
Mason, Chas. H., Tompkinsville, Staten Island, N. Y.
McNiel, Geo. W., Jersey City, N. J.
Moller, Christopher, 149 Madison avenue, New York city.
Moller, Wm. H., Salem Center, N. Y.
Mills, Mortimer, Jersey City, N. J.
McCollom, Dr. A., 52 Bedford street, New York city.
New Haven Kennel Club, New Haven, Conn.
O'Malley, James, 10 Whitehall street, New York city.
Phelan, J. H., 75 Clifton place, Jersey City, N. J.
Piercey, G. H., Jersey City, N. J.
Porter, E S., New Haven, Conn.
Roach, Garrett, 1305 Fifth avenue, New York city.
Rogers, Frank E., 610 Broadway, New York city.
Rowan, Geo. W., Irvington-on-Hudson, N. Y.
Steel, Wm. F., Piermont, N. Y.
Thompson, J. H., Jr., Paterson, N. J.
Towner, H. D., Nyack, N. Y.
Tozier, E. B., 405 Cumberland street, Brooklyn, N. Y.
Trissler, Joseph R., Lancaster, Pa.
Underhill, F S., Newark, N. J.
Vandevort, R. T., Homewood avenue, Pittsburgh, Pa.
Vrendenburgh, A. P., Bergen Point, N. J.
Waite, G. W., Elizabeth, N. J.
Wanstall, John, Washington, D. C.
Wilbrath, Fred, 97 Maiden Lane, New York city.
Williams, W. R., 21 Platt street, New York city.
Wilson, Robert, Brandford, Conn.

Of the fifty exhibitors or breeders applied to, forty indorsed the protest. Among those who declined, three replied that they were in sympathy with the movement but feared the judges would be instructed not to give them prizes at the next show if they indorsed it. Another replied that he had made it a rule to abide by the judge's decisions no matter "what style" of competition he was in. Another could not indorse it because in his opinion the dogs were not judged by the party to whom it applies, but by a kennel club; whereas another considered it useless "seeing that nobody took the slightest notice of the awards."

For Protest Committee,
CHAS. H. MASON.

MINSTREL.

Editor Forest and Stream:

In your issue of March 6 appeared, besides others, a description of my imported English beagle dog Minstrel. As full particulars had not then been received from England, the breeding of Minstrel was not given. Now, for the information of your readers who are interested in the beagle, please publish the following from the London *Shooting Times* of May 16: "Mr. W. H. Ashburner has sold his imported black, white and tan beagle dog Minstrel to Mr. A. C. Krueger, Wrightsville, Pa. This dog was sent by us to Mr. Ashburner, and we had chosen him with great care. He is certainly one of the best beagles we had ever seen, but he will not show himself when on a chain or a leash; hence he was only very highly commended at a late American show.* But judged by points, we doubt if there is a better beagle in America. However, we have been disappointed by the party from whom we secured him. He promised to give us his breeder's name (a Cornish gentleman), so that we could find out Minstrel's pedigree, and then refused to do so on the ground that the gentleman objected to being referred to at all, or even to have his name mentioned in the matter. Under the circumstances we at once wrote to Mr. Ashburner, explaining the matter, and offering to supply him with another beagle if he so desired. As to Minstrel, we repeat it, we doubt very much if there be such a beagle in America. As to judging of the true worth of a dog simply by the position he gets in a prize list, is rubbish. When we say the dog is a good one, he is a good one, let the judges place him as they like, either through their ignorance or through the dog's own fault in not showing himself, but nothing can alter his intrinsic qualities."

In a letter to me, dated May 27, "Wildfowler" says: "Minstrel is a very fine dog. * * * To the best of my belief Minstrel is thoroughbred. He looks a beagle every inch of him."

The above should remove all doubts concerning Minstrel. "Wildfowler" knows a good dog.

There is no apparent necessity for any further pedigree beyond importation if the dog was selected by an able judge, and is really a good specimen of the breed. The well-known Rowett stock of beagles nearly all run back to imported Sam and Dolly and imported Warrior, and at that point all pedigrees cease.

A. C. KRUEGER.

WRIGHTSVILLE, Pa., June 12, 1884.

* This is an error, as Minstrel only got commended at the show in question.

THE CHICAGO DOG SHOW.

THE second grand international bench show of dogs held at D Battery Armory, Chicago, Ill., was a marked success. The quality of the dogs in many classes was a decided improvement on that of last year. Setters and pointers were well represented. The show of deerhounds was remarkably good the Landseer and Clovernook Kennels made a grand display of these magnificent dogs. Irish water-spaniels were a strong class, these dogs having worked themselves into great favor with the Western sportsmen. The arrangements, under the careful superintendency of Mr. Charles Lincoln, were all that could be desired, and the benching and feeding left nothing with which to find fault. Major Taylor judged setters and pointers, and Mr. James Mortimer all other classes. We must here call attention of owners to the fact that a dog to be well shown should be at least clean. Many of the dogs, and especially the setters, were in a filthy condition, and in more than one instance a deserving dog lost his commended card through the neglect of his owner.

In champion mastiffs, Hero II., the only entry, was conspicuous by his absence. In the open class for dogs and bitches, Nelson, a grand brindle, carried off the highest honors. He is a wonderfully good dog in front, with grand, massive skull, but is weak on back and hindquarters. Queen Bess was given second prize. She is a brindle of great size and bone, stands on the best of legs and feet, but is a little snipy in muzzle, a fault she inherits from her dam, Speiro, given c. Juno, vhc., has good skull and muzzle, but is undersized and stands badly on her forelegs. Speiro II., vhc., is of good size and shape, lacks bone, and is long in face.

Champion Rough-coated St. Bernards.—Mr. E. R. Hearn's magnificent dog Duke of Leeds was the only entry. He has much improved on his New York form, has put on considerable flesh, and was in grand coat. In the open class for dogs or bitches, first prize was withheld and second awarded to Samson, a fair young dog, with nice head, but badly shown, being out of coat. Barrie, c, was a very ordinary specimen.

Champion Smooth-coated St. Bernards.—Leila was the only entry. She is certainly the finest bitch ever seen in this country, of great size and substance, grand head and correctly marked. In the open class there were no entries.

Newfoundlands were not a good class, with the exception of the first prize winner, he is of good size, fair head and good coat.

In champion greyhounds, Major beat the Toronto winner; in neck, shoulder and stifles. He is a speedy looking dog, but was not in his best form In the open class, Twilight was given first. She is a very truly made bitch, with beautiful head, and shows great quality, but shown soft, and lacked muscular development. Snowflight, given second, is an immense dog, with a coarse, badly shaped head, but has wonderfully developed haunches, splendid chest, back and loins, and the best of legs and feet. You Know, vhc., was out-classed in the above company, as was Prince, hc., and Prince Albert, c.

In champion deerhounds Roy beat Oscar. Roy is a very typical dog, but is somewhat weak in loin. Oscar is a very large dog, woolly in coat, short in neck, and straight in shoulders and stifles. The open class for dogs or bitches was a very strong one. Mr. Van Hummell, of the Landseer Kennel, showed six excellent dogs, all of which were good ones. The Clovernook Kennel's Mac, however, could not be denied. He is a recent importation, is of great size, truly made, and being a youngster will improve; he was given first prize. Douglass, given second, is one of the best made dogs we have seen, and

has the proper coat; he is only fourteen months old, and will make a clinker. Lady Dare, vhc., and Sheila, c., are litter sisters of Douglass, and are both fine, roomy bitches, the latter a little short of coat. Heather, vhc., is a well-made dog, of correct type, but rather small. Lord Ryno, hc., is a fair dog badly shown. Olga, hc., is a good sort of bitch, with capital head and coat. Cluthan, a four-months-old bitch puppy, although unnoticed, promises to grow into a first-rate one.

Champion English Setter Dogs.—Paul Gladstone had no difficulty in disposing of Dime, the Toronto winner, who, although a good dog, carried too much lumber to please the judge's eye. In extra champion bitches. Dido II., shown in splendid condition, had a walk over, her only competitor, Peep o' Day, being withdrawn. In the open class for dogs, Stanton was placed first, Dictator second, Glen Rock hc. The winner is a well-made dog with nice head, good shoulders and chest, legs and feet, but is a bit on the small side. Dictator has a heavy skull, short neck, and a badly-carried tail. Count Blythe, unnoticed, might have got a place but for his dirty condition. In the corresponding class for bitches Blue Spark was given first, closely pressed by Lucy Dean, a very good little bitch but too curly in coat. Daisy Pembroke was vhc Jeanette and Neenah, hc., were badly shown, but are both good ones, particularly Jeanette. Blue Queen, Flirt and Countess Adele, were each given a commended card. In the puppy class, Countess Lill was placed first, and Forrester second. There was not much to choose between these, the winner being a little the best in back and loin, but they are both good ones; King Noble, vhc., is a well grown puppy with a very plain head; West, hc., and Judge Lincoln and Lady Pembroke II. were fairly good ones.

Gordon Setters.—Gruse was placed first and Dan second. In the puppy class three unnamed ones were placed first, second, and vhc.

Champion Irish Setters, Dogs.—Brush was the only entry; he shows a good deal of quality and is of good coat and color, is rather light in bone and carries a proud tail. In the open class for dogs, Almont, given first, we do not like; he is coarse almost to clumsiness, and has a bad head and badly placed ears. In the corresponding class for bitches. Queen, shown too fat, was placed first, Romaine second and Nell vhc.; we thought Nell showed more quality than Romaine, had better head and coat, but was suckling a litter of puppies and consequently not in her best form. In Irish setter puppies Megora, a worthy descendant of champion Elcho and Rose, was placed first and an unnamed one second.

In champion pointer dogs, any weight, Fritz, very much improved since the New York show, rightly won over Joe, who is bad in head and straight in his stifles. Fritz is a very smart dog, with good head and neck, shoulders well placed, ribs, back and loin good, first-rate legs and feet, is a trifle straight in his hocks. In extra champion pointers, under 55lbs., Bravo, too well known to need description, was the only competitor. He afterward won the special prize for best pointer in the show, Fritz making a very close fight with him for the honors. Pointers, dogs, any weight, were not a good class, with the exception of Pilot, given first. He is a trifle heavy on the shoulder, and not quite so good in loin as he might be, but easily beat Donald II., given second, who is rather a weedy dog, stilty and straight in shoulder, and has a nasty light eye. The others do not need any descript on. In the corresponding class for bitches first prize was withheld and second given to Venus (which was as much as she was entitled to. In the class for puppies, Fly, a three-months-old daughter of Bang and Spinaway, was on exhibition only. She is a very nice puppy and gives promise of maturing into a first-rate one. The prizes were withheld in this class.

Extra Champion Irish Water Spaniels.—Old Barney, with the exception of being a little too fat, was in great form. He has all the old vim in him, was in wonderfully good coat, and looks good for nine more years. He was given the prize over Mike, who was out of coat and does not wear his age so well as his kennel companion. In champion Irish water spaniels, Count Bendigo, after a close fight, won over Storm, who was shown too fat, and is rather too short in the leg and swayed a little in the back. In the open class for dogs, Sinbad II., though in poor coat, won over Dandy, given second. The winner is best in head and ears, also in bone. Dick, vhc., is a fairly good dog, as is Mack, hc., though the latter is very faded and rusty in coat. In the class for bitches, Queen, given first, quite outclassed her competitors. Irish Queen, placed second, is a typical bitch, but rather light in bone. Fly, vhc., has a poor head, and her ears are small and badly placed. Juda and Lady Amphitrite were absent.

Field Spaniels.—Hornell Growler had virtually a walk over, the other entries being poor specimens, and second prize was withheld. In champion cocker spaniels Hornell Silk was the only entry, and was rightly entitled to the prize. In open dog class for cocker spaniels the prizes were withheld. In the corresponding bitch class, Venus, a nice little cocker with good head and coat, but a little high on leg and light in bone, was given first and Cute hc.

Beagles.—There was little to choose between first and second, Scioto, given first, beat Myrtle, second, in chest, loin and coat; Hummer, hc., is a nice puppy; Howler, c., will grow too large.

Dachshunds were a strong class. Juliette, by Unser Fritz (ex Waldine) was given first; she is rather too large, but is very good in head, ear and crook, and is very lengthy and close to the ground. Goethe, second, is another good one, not quite so typical as the winner, while Pluesher and Diana, vhc., and Faust, hc., were each good ones and fully deserved their cards.

Champion Fox-Terriers, Dogs.—Vakeel, the first prize winner at Cleveland, wrongly entered in the open class, had a walk over. In the champion bitch class, the beautiful Village Belle had no trouble in disposing of Gypsey, who is not so good in coat and has a very full eye. In the open class for dogs, Scarsdale was far ahead of his competitors. Dash II., placed second, and Jumbo, vhc., were fair dogs of no particular merit. In the class for bitches, Judy, given first, beat Clover Belle, second, who was out of coat, and has not improved since we last saw her. In the puppy class, Trojan, a new importation, was given first. He is a smart puppy, but a little on the small side, Clover Belle was vhc., and Spy, hc. The latter is a nice-headed puppy, but light of bone and weedy looking.

Robin Adair and Effie were the only entries in the respective collie champion classes. In the open class for dogs Rob Roy, a very nice sable, with splendid coat and of good size, was placed first, over Sharp, second. Sharp has a heavy skull and badly carried tail, but has a profuse coat and is a nicely marked black and tan. The bitch class was poor; first prize was withheld and second given to Prep, a well-made bitch, but quite out of coat.

The bulldog class had only one entry, of the mongrel type, and the prize was withheld.

In champion bull-terriers President was the only entry. In the open class for dogs and bitches, Joker, given first, is a very good one, as is Nell, given second. There were twenty-one entries in this class, but with the exception of the winners they were all of the usual fighting-dog description, with no pretensions to good looks.

Black and tan terriers had only one entry, our old friend Bessy from Toronto; she was in splendid condition. In the class for Bedlington terriers, Blucher carried off the honors. Tynesider II. was absent. Elswick Jock, a promising puppy, was given second and Atlantic hc. Hard-haired Scotch terriers brought out Heather and Tam Glen, placed first and second. These are two good ones, hard to beat. Nellie, c., shows age. In Yorkshire terriers, there was only one fit to be shown, a nicely-coated dog, rather faded in color.

In champion pug dogs, Mrs. Hill's Joe was the only entry. In champion bitches, Mr. J. Englehart won with Bo Peep, a very nice little bitch, beating Judy. In the open class for dogs, Pudgie, given first, is a trifle large, has good skull and wrinkle, proper mask and good coat. Colonel, given second, is a good specimen, but coarse in coat, three unnamed puppies were respectively vhc., hc. and c. Bogie was absent. In the bitch class, Darkey was given first. She has a good skull, large eyes, good mask, has a loose tail and is rather large. Flirt II., second, is smutty, but well-shaped. Flossy, vhc., a five month's old puppy, is nicely marked and looks like growing into a good one.

Toy terriers were good, the first and second prize winners being diminutive black and tans.

Italian greyhounds introduced three very good ones, Rigoletto, given first, is a beautifully-shaped one, rather large; Gip, second, just beat Pedro, vhc., in condition.

The prize was withheld in the toy spaniel class.

The miscellaneous class brought out a collection of all breeds, from the gigantic Ulmer to the toy tan terrier. Three equal prizes were awarded to Pluto, an Ulmer hound, Wasp, a Dandie Dinmont terrier, and Hornet II., a white English terrier; Tot was awarded an extra prize and Tom Brown, a Dalmatian, was given vhc. Outside of these there was a very nice collection of Blenheim and King Charles spaniels and Yorkshire terriers, all very good ones, which were unfortunately entered too late for competition.

Following is a full list of the

AWARDS.

Champion Mastiffs.—Absent.

Mastiffs.—1st, B. B. Bullwinkle's Nelson, brindle, 4yrs., and 2d, Queen Bess, brindle, 1yr., Nelson—Speiro. Very high com., E. Sheffield Porter's Juno, fawn, black points, 2yrs., Turco—Queen; B. B. Bullwinkle's Speiro II., 1yr., Nelson—Speiro. Com., B. B. Bullwinkle's Speiro, fawn, 5yrs.

Champion Rough-Coated St. Bernards.—E. R. Hearn's Duke of Leeds, imported, rich orange, brindle, 2yrs., Mount Zion II.—Novice.

Rough-Coated St. Bernards.—1st withheld; 2d, Clovernook Kennel's Samson, tawny and white, 16mos., Monk II.—Sheila. Com., W. N. Cornholm's Barrie, imported, dark orange, tawny, 21mos., Bruno—Minka.

Champion Smooth-Coated St. Bernards.—E. R. Hearn's Leila (E.K. C.S.B. 12,012), imported, tawny brindle, 2½yrs., Roland—Nellie.

Newfoundlands.—1st, S. R. Ireland's Pete, black, 2¼yrs., Barney—Vic; 2d, Fritz Moritz's Melac, black, 17mos.

Champion Greyhounds.—Geo. S. Parvin's Major, mouse, 2yrs., Prince—Gipsey.

Greyhounds.—1st and 2d, The Landseer Kennel's Twilight, brindle and white, 4yrs., imported Quicksilver—Stratagem; Snowflight, white, 3yrs., Son of Misterton—Bonnie Lassie. Very high com., Carl Young's You Know, fawn, 3yrs., sire and dam imported. High com., H. Schanze's Prince, fawn, 20mos. Com., Mrs. Fred. W. Madera's Prince Albert, fawn and Maltese, 17mos., Clyde of Scotland—Queen of the Plains.

Champion Deerhounds.—Clovernook Kennel's Roy, brindle fawn, 2yrs., Paddy—Lassie.

Deerhounds.—1st, Clovernook Kennel's Mac, brindle fawn, 2yrs., Paddy—Lassie; 2d, The Landseer Kennel's Douglass, fawny brindle, 14mos., imported Oscar—Olga. Very high com., The Landseer Kennel's Lady Dare, grizzly gray, 14mos., imported Oscar—Olga; Clovernook Kennel's Heather, blue, 16mos., Clansman—Countess. High com., The Landseer Kennel's Olga, tawny brindle. 4yrs., Bruce—Whitman's imported bitch, and Lord Ryno, grizzly gray, 15mos., imported Luke—Lorna II. Com., L. M. Hamline's Archie, light brindle, 11mos., Rowell—Lufra; The Landseer Kennel's Sheila, tawny brindle, 14mos., imported Oscar—Olga.

Champion English Setters, Dogs.—W. B. Gates's Paul Gladstone, black, white and tan, 2yrs., champion Gladstone—Lavalette.

Extra Champion English Setters, Bitches.—W. B. Shattuc's champion Dido II., black, white and tan, 3½yrs., Druid—Star.

English Setters, Dogs.—1st, H. Bryson's Stanton, white, black and tan, 2½yrs., champion Gladstone—Frost; 2d, J. I. Case, Jr.'s, Dictator, black, white and tan, 2½yrs., Rake—Phyllis. High com., Dr. E. L. Mayo's Glen Rock, blue belton, 2yrs., Druid—Princess Draco.

English Setters, Bitches.—1st, T. Donnoghue's Blue Spark, blue belton, 17mos., Hornet—Daisy; 2d, International Kennel Club's Lucy Dean, blue belton, 2½yrs., champion Pasha—Coomassie. Very high com., N. B. Cook's Daisy Pembroke, black, white and tan, 2yrs., Pembroke—Royal Gift. High com., Lake Shore Kennel's Neenah, white, black and tan, 18mos., Harrison's London—Dawn, and Jeannette, lemon and white, 18mos., Dick Laverack—Twilight. Com., J. H. Whitman's Flirt, lemon and white, 5yrs., Druid—Milley; T. Donnoghue's, Blue Queen, black, white and tan, 4yrs. Druid—Leda; Lake Shore Kennel's Countess Adelle, white, black and tan, 3yrs., Count Noble—Princess Belle.

English Setter Puppies.—1st, Jno. L. Barker's Countess Lill, blue belton, 11mos., Gladstone—Donna J.; 2d, Joseph R. Dyer's Forrester, black and white ticked, 11mos., Gladstone—Countess Druid. Very high com., Jno. L. Barker's King Noble, blue belton, 9mos. Count Noble—Rosalind. High com., A. M. Weinhardt's West, black and white, 10mos., Jack, Jr.—Lady Rattler. Com., Mrs. F. S. Hunt's Judge Lincoln, black, white and tan, 4mos., Judge—Lady Pembroke. Com., S. S. Brewer's Lady Pembroke II., blue belton, 4mos., Judge—Lady Pembroke.

Gordon Setters.—1st, J. H. Umberhine's Grouse, black and tan, 3yrs, Dart—Fly; 2d, E. Thomas, Jr.'s Dan, black and tan, 2yrs., Shot—Gordon Setter Puppies.—1st. E. Thomas Jr.'s —— black and tan, 3mos., Shot—Fannie; 2d, E. Thomas Jr.'s —— black and tan, 3mos., Shot—Fannie. Very high com., E. Thomas, Jr.'s —— black and tan, 3mos., Shot—Fannie.

Extra Champion Irish Setters, Dogs.—Absent.

Champion Irish Setters—Dogs.—1st, J. A. J. Sprague's Brush, red, 5yrs., champion Elcho—Champion Rose.

Irish Setters, Dogs.—1st, E. Thomas. Jr.'s Almont, red, 2yrs., champion Elcho—Lina.

Irish Setters, Bitches.—1st, T. Donnoghue's Queen, red, 4yrs., Tolleston—Bridget; 2d, Ashmont Kennel's Romaine, red, 2½yrs., champion Elcho—Rose. Very high com., Frank H. Tuttle's Nell, red, 2½yrs., Branch—Star.

Irish Setter Puppies.—1st, J. A. J. Sprague's Megora, red, 10mos., champion Elcho—champion Rose; 2d, Frank H. Tuttle's ——, red, 6mos, Mike—Nell.

Champion Pointers, Any Weight, Dogs.—C. W. Littlejohn's Fritz, lemon and white ticked, 3yrs., Beaufort—Spot.

Extra Champion Pointers Under 55 lbs., Dogs.—Norbury Kennel's Bravo, lemon and white, 4yrs, Bragg—Kate.

Pointers, Dogs, Any Weight.—C. W. Littlejohn's Pilot, lemon and white, 3½yrs., Scout—Dame; 2d, C. M. Mumhall's Donald II., liver, white and ticked, 30mos., champion Donald—Devonshire Lass.

Pointers, Bitches, Any Weight.—1st, withheld; 2d, W. A. Thompson's Venus, lemon and white, 2yrs. 2mos., champion King Bow—Chess.

Pointer Puppies.—Prizes withheld.

Extra Champion Irish Water Spaniels—Excelsior Irish Water Spaniel Kennel's Barney, dark liver, 9yrs., Shamrock—Shannon.

Champion Irish Water Spaniels.—T. Donnoghue's Count Bendigo, liver, 4½yrs., Bob—Bridget.

Irish Water Spaniels, Dogs.—1st, J. H. Whitman's Sinbad II. (late Bob) liver, 6yrs., Sinbad—Queen; 2d, Charles A. Boxer's Dandy, liver, 3½yrs., Dandy—Judy. Very high com., Richard W. Stafford's Dick, liver, 1yr., Dan—Irish Queen. High com., Excelsior Irish Water Spaniel Kennel's Mack, dark liver, 17mos., Barney—Lady.

Irish Water Spaniels, Bitches.—1st., T. Donnoghue's Queen, liver, 3½yrs., Shady—Lottie; 2d, Richard W. Stafford's Irish Queen, liver, 2½yrs., Champion Barney—Cricket. Very high com., Excelsior Irish Water Spaniel Kennel's Fly, dark liver, 1yr., Mike—Lady.

Field Spaniels.—Hornell Spaniel Club's Hornell Growler, black, 3yrs., Brag—Nell; 2d, withheld.

Champion Cocker Spaniels, Dogs or Bitches.—Hornell Spaniel Club's Hornell Silk, black, 22mos, Champion Obo—Chloe II.

Cocker Spaniels, Dogs.—Prizes withheld.

Cocker Spaniels, Bitches.—1st, J. H. Whitman's Venus, liver and white. 3½yrs, Carly—Nellie; 2d, withheld. High com., J. H. Whitman, Cute, liver and white, 5yrs., Deck—Nelly Bly.

Beagles.—1st, T. Lane's Scioto, white, black and tan, Max—Fanny; 2d, Charles Schwein's Myrtle, white, black and tan, 3yrs., Rattler—Lula. High com., F. T. Lane's Hummer, white, black and tan, 5½mos., Sam II.—Scioto. Com., F. T. Lane's Howler, white, black and tan. 5½mos., Sam II.—Scioto.

Dachshunde.—1st and 2d, Geo. Poppert's Juliette, red, 3yrs., Unser Fritz—Waldine; Goethe, red, 22mos., Pluesher—Juliette. Very high com., Wm. Loeffler's Diana, black and tan, 6mos., Waldmann II.—Babette; Geo. Poppert's Pluesher, red and white, 2yrs, Waldmann—Gretchen. High com., Geo. Poppert's Faust, red, 22mos., Pluesher—Juliette.

Champion Fox-Terriers, Dogs.—F. B. Lysons's Vakeel, black, white and tan, 2½yrs., champion Volo—champion Spiteful.

Champion Fox-Terriers, Bitches.—Frank C. Wheeler's Village Belle (E.K.C.S.B. 12,427), white, black and tan, 2¾yrs., champion Volo—champion Beauty.

Fox-Terriers, Dogs.—1st, Clovernook Kennel's Scarsdale, white, black and tan, 3yrs., Joker—Ella; 2d, S. C. Bruner's Dash II., white, black and tan, 16mos., imported Dash—imported Beauty. Very high com., Thos. Chandler's Jumbo, black, white and tan, 2yrs., imported Zero—imported Bell.

Fox-terriers, Bitches.—1st, Martin Kelley's Judy, white, black and tan, 10mos., Bob—Redden's bitch; 2d, Clovernook Kennel's Clover Belle, white, black and tan, 10mos., Joker—Warren Wakeful. High com., F. E. Willard's Vicker, imported, white, black and tan, 18mos., Viper—Nell. Com., John F. Ryan's (V. S.) Beauty, white, imported Jim—imported Gip.

Fox-terriers, Puppies.—1st, Clovernook Kennel's Trojan, white, black and tan, imported. Very high com., Clovernook Kennel's Clover Belle, white, black and tan, 10mos., Joker—Warren Wakeful. High com., F. B. Lysons's Spy, white and tan, 11mos., champion Rattler—Lily. Com., Martin Kelley's white, black and tan, 2½mos., Trimmer—Vicker.

Extra Champion Collies.—Thomas H. Terry's Robin Adair (A.K.R. 892).

Champion Collies.—Thomas H Terry's Effie (A.K.R. 1231).

Collies, Dogs.—1st, J. A. Long's Rob Roy, golden sable, 12mos., champion Champagne—Maude; 2d, F. B. Lysons's Sharp, black and tan, 3yrs., imported.

Collies, Bitches.—1st withheld; 2d, John Kidston's Prep, black and tan, 1yr.

Bulldogs, Bitches.—Prizes withheld.

Champion Bull-Terriers.—1st, E. Sheffield Porter's President, white, 6yrs., Randall—Minnie.

Bull-Terriers.—1st, Charles E. Feller's Joker, white, 2yrs., Joker—Russ; 2d, Charles E. Feller's Nell, white, 2yrs., Victor Nell.

Black and Tan Terriers over 7 lbs.—1st, John F. Scholes's Bessy, 2yrs., imported Nep—imported Top.

Bedlington Terriers.—1st, John F. Scholes's Blucher, liver, 2½yrs., Winon's Teachon—J. A. Batty's Jess; 2d, W. S. Jackson's Elswick Jock, dark blue, 9mos., Elswick Lad—Tyneside II. High com., John Massey's Atlantic, blue black, 3mos., Elswick's Lad—Tyneside II.

Hard-Haired Scotch Terriers.—1st, John H. Naylor's Heather, brindle, 26mos.; 2d, John H. Naylor's Tam Glen, dark brindle, 21mos. Com., Mrs. Dr. W. H. D. Lewis's Nellie, blue grey, 6yrs., Flick—Flock.

Yorkshire Terriers, Blue and Tan.—1st, Lake Shore Kennel's Silver II.; imported; 2d, withheld. Com., Charles Schwein's Lillie, 2yrs., Sandy—bitch by champion Dreadnought.

Champion Pugs, Dog.—Mrs. Geo. H. Hill's Joe, fawn, 4yrs., champion Comedy—Clytie.

Champion Pugs, Bitch.—J. Englehart's Bo-Peep, fawn, 2yrs. and 9mos., Fritz—Minnie May.

Pugs, Dogs.—1st, Joe R. Richards's Pudgie, fawn, 15mos., imported Joe; 2d, Mrs. O. S. Cummings's Colonel, light fawn, 2yrs. Very high com., Mrs. C. S. Cummings's Puppy, 9mos., Colonel—Darkey. High com., Mrs. C. S. Cummings's Jumbo, light fawn, 5mos., Colonel—Darkey. Com., Mrs. C. S. Cummings's Puppy, 9mos., Colonel—Darkey.

Pugs, Bitches.—1st, Mrs. C. S. Cummings's Darkey, fawn, 2 yrs.; 2d, Mrs. F. P. Fisk's Flirt II., fawn. 8mos., Bogie—Flirt I. Very high com., Mrs. C. S. Cummings's Flossy, light fawn, 5mos., Colonel—Darkey.

Toy Terriers, Dogs or Bitches, other than Yorkshire, under 7lbs.—1st, Miss Mamie Lucas's Fifini, black and tan, 17mos., Cricket—Fidele; 2d, Minnie St. Clair's Gypsey, black and tan terrier, 4yrs., Jack—Fanny. Very high com., Mrs. H. S. Sheplar's, Topsey, black terrier, 3yrs. High com., J. F. Dagley's Blue Bell, blue and tan, 7½mos., Paddy—Nancy.

Italian Greyhounds.—1st, Mrs. C. H. McCulloch's Rigoletto, fawn, 5yrs., imported; 2d, J. Engelhart's Gip, fawn and white, 20mos. Very high com., J. Engelhart's Pedro, fawn and white, 3yrs.

Toy Spaniels.—Prizes withheld.

Miscellaneous, or Foreign Class.—Equal 1st, The Rambler's Pluto, imported Ulmer, brindle striped, 3½yrs., full pedigree; R. P. Palmer's Wasp, Dandie Dinmont terrier, pepper and salt, 2½yrs., imported Darkie—imported Nell; John F. Scholes's Hornett II., English terrier, white, 2½yrs., Hornett—Diamond. Extra 1st, Mrs. P. J. Conlisk's Tot, English tan terrier, 2yrs., Turner's John—Rodger's Ripple. Very high com., Tony Denier's Tom Brown, Dalmatian, 3½yrs., Tom Hughes—Rugby.

SPECIAL PRIZES.

Class A. Best English setter—Gen. W. S. Shattuc's Dido II.

Class B. Best collection of sporting dogs—T. Donoghue.

Class C. Best brace of English setters—T. Donoghue's Blue Queen and Blue Spark.

Class D. Best hard-haired Scotch terrier—John H. Naylor's Heather.

Class E. Best pug in open class owned by a lady—Mrs. C. S. Cummings's Colonel.

Class F. Best English setter over 12 and under 20mos.—T. Donoghue's Blue Spark.

Class G. Best Bedlington terrier—John F. Scholes's Blucher.

Class H. Best Italian greyhound—Mrs. C. H. McCulloch's Rigoletto.

Class I. Best Irish water spaniel in open class—J. H. Whitman's Sinbad II.

Class J. Best Irish water spaniel—Excelsior Irish Water Spaniel Kennel's Barney.

Class K. Best pointer dog—The Norbury Kennel's Bravo.

Class L. Best pointer bitch—W. A. Thompson's Venus.

Class M. Best St. Bernard—E. R. Hearn's Duke of Leeds.

Class N. Best hard-haired Scotch terrier—John H. Naylor's Heather.

Class O. Best pointer under 18mos—J. Donoghue's Croxteth's Rival Queen.

Class P. Best five English setters—Lake Shore Kennel's Countess Adelle, Neenah, Jeannette, Lady Lucy and Lady Juno.

Class Q. Best bull-terrier—E. S. Porter's President.

Class R. Best fox-terrier puppy—Clovernook Kennel's Trojan.

Class S. Best black and tan toy terrier owned by a lady—Miss Mamie Lucas's Fifini.

Class T. Best pug owned by a lady—Mrs. George H. Hill's Joe.

Class U. Best brace of setters the get of Pembroke—Lake Shore Kennel's Lady Lucy and Lady Juno.

Class V. Best five Irish water spaniels—Excelsior Irish Water Spaniel Kennel's Barney, Mike, Storm, Mack and Fly.

Class W. Best five cocker spaniels—J. H. Whitman's Jimmy Crow, Chung, Venus, Cute and Chloe.

Class X. Best five fox-terriers—The Clovernook Kennel's Scarsdale, Clover Belle, Trojan, Pricilla and Spite.

Class Y. Best kennel deerhounds—Dr. Van Hummell's Oscar, Douglas, Lady Dare, Olga, Lord Ryno, Sheila and Cluthan.

Class Z. Best collection of pugs—Mrs. C. S. Cummings.

Class AA. Best kennel English setters—Lake Shore Kennel.

THE BENCH SHOW ASSOCIATION.

Editor Forest and Stream:

We have become convinced that the invitation to kennel clubs to meet the Westminster Kennel Club on June 21 and discuss the advisability of forming a general association, has not given those interested in the subject sufficient time for consideration. We feel, too, that the question of whether the association should be one of individuals or clubs should be fully discussed. On the whole, it seems best to postpone the meeting, and we have so advised the various clubs to whom our invitation was addressed.

Notice of the meeting will be sent you when the date has been fixed. ROBERT C. CORNELL, Secretary.

THE PHILADELPHIA DOG SHOW.

ALREADY the Pennsylvania State Agricultural Society has begun the erection of the several buildings in which will be exhibited the live stock entered for competition at the State Fair, which hereafter will take place yearly in our city. The department to be devoted to dogs will be commodious and well ventilated, and within the grounds—thirty acres in extent—excellent opportunity will be given for exercising all animals displayed. Both the Pennsylvania Railroad and the Reading Railroad companies are laying their tracks directly into the inclosure, which will be the greatest convenience to both visitors to the bench show and owners wishing to ship their animals.

The question of the appointing of judges for the dog show has been brought before a meeting of the Kennel Club and it is the intention of the organization to be careful in their selection. At this early date quite a long list of special prizes has been promised, and it is confidently expected that many more will be secured. The regular prize list equals that of any of the bench shows yet held, but the puppy classes have been in every instance dropped, a wise decision, it is said, for it has been often remarked of late that every youngster sent to a dog show should be accompanied with crape on his collar, especially if the animal has not passed through a distemper attack: moreover a fair judgment can never be made between dogs of five to seven months old, and those not quite a year, when they are competing in the lists. At the coming

show of the Philadelphia Kennel Club very good opportunities will present themselves to exhibitors wishing to dispose of field dogs, as the time will be so short before the shooting season opens, when setters and pointers will be in demand, and well-bred non-sporting dogs, especially collies, will be inquired for by the farmer visitor to the State Fair. HOMO.

ENGLISH KENNEL NOTES.

"NO DOGS," murmured discontentedly the multitudes on Epsom Downs last week, assembled to witness the classic race. The regularity of his appearance has led holiday-makers to expect him. As soon as the course has been cleared by the police for the great race, and the green streak that divides the vast crowd is visible, then we expect "his coming and look brighter when he comes," and this year we regarded it as bad omen that "the Derby is falling off," and that no frightened mongrel tore madly along, wildly seeking a spot to hide himself from the exultant cheers of recognition that noisely hail his appearance. Of course, we all lost our money in consequence, and Lillibulero hadn't even the decency to start. Perhaps the "Derby dog" knew something—perhaps he anticipated the cold reception of the invalid that won. As I sat after the race dangling my legs over the side of the coach, vainly hammering my disappointment on a lobster-claw that would not break, and heard the remarks, "Sir John is a hot 'un;" "So is the Captain;" "How does Plunger Walton like it?" I thought the dog displayed his intelligence in not coming on "in that scene." But the dear old dog was there for the Oaks and urged his wild career and brought back the backers' luck.

News reaches me the York show turned out better than expected; the entries, I believe, numbered about seven hundred. The judging took place on Saturday. Among the judges is Mr. Hugh Dalziel, who is, I believe, within the recollection of New Yorkers from the time he judged in their city. I think Dr. Gordon Stables was his colleague on that occasion. I don't know how true it is, but I have heard that the latter gentleman offered to officiate on that occasion in "Highland costume," if the promoters of the show thought it would improve the "gate". I doubt not Sir Hugh was highly indignant at the suggestion, as he also hails from the "land of cakes."

Hugh Dalziel (pronounced Dl. simply the first and last letters of the name, in Scotland) is the giant of our doggy press. He towers above all our scribblers in knowledge of the subject and ability to treat it. His specialist knowledge of medicine makes his advice on doggy ailments the best obtainable and gets subscribers for the *Bazaar* who apply to him through the correspondence column for gratis advice.

His writings are clear and concise, every idea is plainly expressed and each argument as he writes it is hammered in with rugged Carlylese English. He has a broad, hard-hitting style devoid of flowery decoration. He "shoots folly as it flies" with cannon balls. He is essentially the free lance of journalism and it is owing to his blunt candor that he is not now sitting on the soft cushion of the *Field* editorial chair.

It is his misfortune that in his frequent tirades against abuses, prejudice and ignorance, that friends often receive some of the indiscriminate blows that he freely rains about him. In his last fight, the "Lochinvar" case in the *Field*, he has maintained his reputation, and though the editor of that paper threw his fighting weight in the scale of his opponents, yet the impartial reader has seen that Mr. Dalziel has made out a very unpleasant case against the Hertford committee's fairness, Mr. Murchison's idea of duty toward one neighbor and Kennel Club justice.

Years back Mr. Dalziel wrote for the defunct *Country*, but he is permanently attached to no paper at present, though notes and letters signed "Corsincon" frequently appear in the *Stock Keeper*, *Kennel Review*, *Scottish Fancier*, *Live Stock*, etc. He was one of the founders of the Dandie Dinmont Club and his heart has ever been true to that breed. He is an excellent judge of all breeds of terriers. I should sum up his character as "an aggressively honest hard-hitter."

The English exhibitors at the Antwerp show did remarkably well. Mr. Lort judged the English classes, but as he was absent on the second day the reporters of the *Live Stock Journal* (Mr. Gresham) and *Shooting Times* (Mr. Langdale) were called in to conclude his duties. The first named, I hear, exhilarated by the prominence, forgot that *suaviter in modo* should not be left at home when traveling. The English kennels present were chiefly represented by their "second strings," though perhaps that expression is not fair to Mr Edwin Nicholl's exhibits, among which was his grand bloodhound. Triumph, who appropriately enough won the St. Hubert prize of the St. Hubert Club. It must have been with a pang of regret that the Dutchmen saw him return to England. Mr. Alfred George brought away several prizes.

The Paris show is now on and I hear the numerous packs make a fine sight in the Gardens of the Tuileries. They are attended by the huntsmen, who wake up the neighborhood each morning with the music of their curly brass horns. These gentlemen are wonderfully got up and their gaudy liveries put even the fierce *Chasseurs d'Afrique* out of countenance. I don't think many Englishmen have considered it "good enough" to go over, for the show is dreadfully organized. It ought to be otherwise. There are sportsmen in France who could do it better if they got the chance. There is Ernest Bellecroix, for instance, editor of the *Chasse Illustrée*, and lately elected a member of the Kennel Club, surely he might induce the Kennel Club to assist him with advice. Why do they not invite Mr. Lewis Clement, proprietor of the *Shooting Times*, to help them? His French is so good that he speaks English with a Gallic accent, his varied experience in dogs and dog shows, acquired during his engagements as kennel reporter on the *Field* and *Bell's Life*, would be of invaluable assistance. "Barkis is willin'," I am sure, and no one would be more in his element in the gay metropolis than the volatile "Wildfowler." At present the Paris show is exclusively patronized by masters of hounds and dog dealers, but give us a good schedule and reliable judges and we shall not neglect the opportunity to show them the best. The time is favorable enough, Auteuil races on Sunday, dog show all the week, and the Grand Prix to conclude with; there's a programme to stir the blood, though one's sire do sit "cut in alabaster." Even these gay Londoners would leave their "Empire" and "Healtheries" for the "Eden" and "Bignon's."

Mr. Lewis Clement is not a man to lean against a tree and watch the sundial; there is a lot of enterprise in his little paper, the *Shooting Times*, and it contains an announcement this week that has knocked the breath out of the quiet old bodies in the Strand, Fleet street and Hampstead Road.

In future subscribers can advertise dogs for sale gratis. At first sight it looks two to one on the subscriber, but it would not do to imagine that "Wildfowler" had not a bit up his sleeve; besides, the plan is an old one on the Continent, and if it pays there it may have a like chance here. I shall open next week's number with amused expectation.

I get the *Shooting Times* regularly, and having met the owner at one or two shows, I am able to appreciate his large personal share in its columns. I believe the paper has passed through the troubled waters which everybody who starts a newspaper must expect to meet. Mr. Clement first became familiar to sporting readers for his punting articles under the *nom de plume* of "Wildfowler" in the columns of *Bell's Life*. He left them to go on the *Field*. He did their dog-show reports, and quite the best of the kind I have always considered them. He wrote the report on the bloodhound Napier, which brought a libel case down on the *Field*. "Wildfowler" has more than the courage of his opinions, he has the impudence of them; sometimes, of course, he is wrong, and the Napier case was one of them, I think.

While engaged on the *Field* staff he did a very large business in dogs, and this it was that brought him into conflict with the autocrat of the paper, Dr. Walsh, who put the alter native plainly, "Give up the *Field* or the dogs." He gave up the *Field*, went to the dogs and started the *Shooting Times*, and Vero Shaw reigned in his stead. The staff of the paper is a small one, it consists of the editor, himself; a racing editor, Mr. Bromhead, of the *Sporting Mirror*, who writes as Diomed; a gentleman who combines leader writer, dramatic critic and poet, Mr. W. Pocklington, and a reporter, Mr. Langdale, who was once among the exhibitors as a spaniel man.

We are all much interested in the Paris savant's discoveries, and if Mons. Pasteur's commission of inquiry really decide that he has found out a cure for that terrible malady, hydrophobia, no honor in the French Government's power will be too great to offer such a benefactor of humanity. I am promised a complete copy of Mons. Pasteur's report, and if I get it will forward it to the editor

Some notes from York show have just reached me. None of the cracks turned up in the bloodhound class. Crown Princess was champion in the mastiffs, in open dogs Prince, Surajah and Commodore won, and Cleopatria, Ilford Claudia and Ilford Charity in bitches.

In St. Bernards the prize winners were Glacier, Courage II., and Storm-King; bitches, Cloister, Crevasse II. and Khiva. Mr. Goodwin's new purchase, Silver King, by Hermit, won in puppies. The winner of the field trial pointer class was Mr. Norrish's champion Graphic, and for the setter prize there was a tie between Mr. H. F. Grant's Junior Carlton and Mr. Bower's Bessie IV. The Duke of Portland did some winning with his spaniels, and Mr. Easten's team also won in their own classes. Collies were a good show, Mr. John Pirie getting first and third in open dogs and pups with two litter brothers by Eclipse, a half sister to Eclipse, Mistress Beatrix, won in bitches. In the basset classes all the winners came from one kennel and the cup went there too. Mrs. Merrick Hoare's large entry won several prizes in dachshunde.

LILLIBULERO.

JUNE 3, 1884.

RETRIEVER CHALLENGE.—*Editor Forest and Stream:* I hereby challenge Mr. Luke W. White to compete with his Grace against my Fritz in retrieving anywhere in New England the coming fall, the same to be judged by any one not prejudiced against a trick dog. Mr. White says Mr. J. R. Pierson told him that "Grace could not be beat." I would be pleased to have Mr. Pierson judge them. Intelligence, obedience, style, delicacy, to be considered. The following to be used: Tissue balloons, pins, eggs, men, live or dead birds (game or other birds), on land, water, or under water. I claim Fritz will retrieve any bird named that is thrown out, if there are twenty kinds, and will do it blindfolded. Also retrieve two small birds at once. If Mr. White does not accept this challenge, it is open to any one, and barring no breed of dogs. —A. C. COLLINS (Hartford, Conn., June 10).

DOGS ATTRACT LIGHTNING.—Richard Lowe and his men hurried into his barn at Neshanic, N. J., when the shower came up last Friday afternoon, and an old shepherd dog ran in after them. "Dogs attract lightning," said Mr. Lowe, anxiously, "and we had better leave." The words had hardly escaped his lips when a thunderbolt killed the dog. None of the men was injured.—*Sun.*

YORK ROYAL.—We have received from one of our regular English correspondents a report of the York Royal Dog Show. It will be printed next week.

HOW WOULD YOU LIKE IT to have your wife and children in want of the necessaries of life? Many families have suffered this from the death of a protector who expected it as little as you. Moral: Insure in the Travelers, of Hartford, Conn.—*Adv.*

Rifle and Trap Shooting.

RANGE AND GALLERY.

BOSTON, June 14.—There was a very small attendance at Walnut Hill to day, and most of the shooting was in the Creedmoor practice match. There was also a team match by telegraph with the Manchester (N. H.) Rifle Club, which was won by the M. R. A., though in their team there were some men who had never shot in a team match before. Tuesday next the range will be open for the regular rifle matches, and the directors' medal will be shot for. Wednesday the shotgun men will occupy the grounds. Following are the best scores:

Creedmoor Practice Match.

O M Jewell	4	5	5	5	5	4	5	5	4	5	5	4	5	5	4	5—47
H Cushing	5	4	2	5	5	4	4	5	5	4	5	5	4	5	5	4—46

GANANOQUE, Ont., June 10.—A rifle match was held at the Gananoque Association ranges here this afternoon between five men of the Kingston Rifle Association and five men of Gananoque, which resulted in a victory for the Kingstonians by 30 points. The wind was puffy and heavy across the range from the right, and the light was bad, making it impossible to get on a good score. The following is the score made with five shots each man at each range:

Kingston.	200	400	500		Gananoque.	200	400	500	
Capt Curry	18	15	15—48		Lieut Sheilds	14	17	11—42	
Capt Cartwright	12	18	17—47		Corp Wright	18	14	18- 50	
Private Hora	16	23	19—58		A Petrie	19	20	18—57	
Lieut Cartwright	20	19	18—57		Maj Mackenzie	14	7	6 - 27	
Sergt Hora	13	18	24—55		J S Matthews	19	18	21—58	
			265						235

NEWARK, N. J., June 12.—The shooting festival of the Newark Shooting Society was very successfully conducted at the Shooting Park. The spectators and participants in the sport were in excess of previous years, and many representatives were present from Washington, Pittston, Pittsburgh, Boston, Davenport, Ia., and other places. The shooting began on Monday and continued until this evening, when the prizes were awarded. The scores of the winners of the chief prizes were as follows: Man Target—F. W. Schmider 60, S. Ellsworth 59, T. P. Delahanty, E. Holzman and E. Berg 58. Ring Target—H. Dehl, G. Quitmeyer and E. G. Zeller 71, L. Vogel, Wm. Hayes and J. Schmidt 70. Target of Honor—Wm. Hayes 68, Wm. Frommer and E. Klein 67, M. L. Riggs 66.

PHILADELPHIA, June 12.—The monthly contest for the champion's gold medal of the Passyunk Rifle Company, of Philadelphia, took place at the Stockton Range, Camden, on June 11. A strong wind, almost a gale, was blowing across the range, making shooting extremely uncertain and difficult. Quartermaster Wallace M. Hoffner, with a score of 33, will wear the medal for June. Distance 200yds., 10 shots, open sights.

FORT KEOGH, M. T.—W. M. Farrow has reached this point on his westward trip and is the guest of Lieut. J. M. T. Partello. The two crack shots enjoyed a little shooting at 500yds., off-hand, at the regular Creedmoor target, the score standing for Mr. Farrow: 4 5 5 5 5—24.

THE TRAP.

Correspondents who favor us with club scores are particularly requested to write on one side of the paper only.

BOSTON GUN CLUB.

BAD weather did not prevent a large and influential attendance at the Wellington shoot June 11. Shooters from a large number of the outside clubs coming to do justice to the different matches which had been duly programmed for some time past. The wind was shifty, straining the ability of the trap shooters present to the utmost. The next shoot of this club, on June 25, will complete the series for the elegant gold medal presented to the best three-men team. A large number have signified their intention to do honors by their presence on the occasion when the final struggle takes place. The Massachusetts Rifle Association at present have the best scores, but the last shoot may afford the chance of changing.

Match 1.—5 single birds, 18yds., rise:

B F Johnson	11110—4	G F Cutting	10011—3
S H Wurms	10111—4	W H Allen	01011—3
C DeRochmont	01110—3	J Bartlett	11111—5
F L Papanti	11100—3	D Kirkwood	10101—3

Bartlett first, Johnson and Wurms second, DeRochmont and Allen third.

Match 2.—Conditions as above:

DeRochmont	11111—5	H Mason	10110—3
Wurms	11111—5	Bartlett	11101—4
Johnson	01110—3	Cutting	10011—3
Allen	10101—3	Chambers	11011—4

Wurms and DeRochmont first, Chambers and Bartlett second, Cutting and Johnson third.

Match 3.—3 pair doubles, 15yds. rise:

H H Francis	11 01 11—5	Johnson	10 10 00—2
Kirkwood	01 00 11 3	C Wilbur	11 01 10—4
DeRochmont	10 10 10—3	W L Miner	11 00 01—3
Allen	11 11 10—5	T Howard	10 10 11—4
Papanti	00 01 11—3	Bartlett	10 11 01—4
Wurms	11 01 11—5		

Francis and Allen first, Howard second, Papanti third, Johnson fourth.

Match 4.—7 birds, 18yds. rise:

DeRochmont	1011101—5	Howard	1100111—5
Kirkwood	1111111—7	Bartlett	0101110 4
Wilbur	1101111 - 6	Cutting	1001110—4
Francis	1101001—4	Johnson	1011100 4
Allen	1101111—6	Crandall	1011010—4
Wurms	1101111 - 6	E W Tinker	0111110—5
Miner	0101101—4	J B Valentine	1 11010—5

Kirkwood first, Wurms second, Tinker third, Francis fourth.

Match 9.—5 pair doubles, 15yds. rise.

Kirkwood	11 00 11 11 11—7	Francis	11 01 10 11 11—8
Howard	10 10 11 10 11—7	Johnson	11 11 01 11 11—9
Wilbur	10 10 00 01 01—4	Tinker	11 11 11 10 11- 9
Wurms	11 10 01 11 11—8	S Perry	11 00 11 11 10—7
Law	00 11 00 01 01—4	Valentine	11 10 11 11 11—9

Tinker first, Wurms and Francis second, Kirkwood and Howard third, Law and Wilbur fourth.

Match 10.—7 single birds, 18yds.

Miner	1010111—5	Francis	1101111—6
E Smith	1100011—4	Crandall	1111111—7
T G Stanton	1011111—6	Law	1111111—7
H Souther	1001101—4	Snow	1011101—5
Perry	0110011—4	Wurms	1111111—7
Wilbur	1010111—5	Graham	1011001—4
Bartlett	1100111—5	Tinker	1111110—6
Howard	1011011—5		

Law, Crandall and Wurms first, Tinker and Francis second, Howard and Wilbur third, Smith fourth.

Match 11.—5 single birds.

Tinker	11111—5	Smith	11001—3
Kirkwood	10110—3	Souther	10101—3
Wilbur	01110—3	Stanton	10111—4
Papanti	11100—3	Law	11111—5
Wurms	11110—4	Crandall	01011—3
Johnson	01010—2	Valentine	01001—2
Bartlett	01001—2	Perry	00101—2
Snow	10110—3	Cut ing	10111—4

Law and Tinker first, Stanton, Cutting and Wurms second, Smith and Wilbur third, Perry fourth.

Match 12.—7 single birds:

Wurms	1110111—6	Miner	1100101—4
Kirkwood	1111010—5	Law	0101101—4
Francis	0101011—4	Papanti	0001011—3
Stanton	1010100—3	Wilbur	1010111—5
Johnson	0010101—3	Snow	0110001—3
Souther	1000110—3		

Wurms first, Kirkwood and Wilbur second, Miner third, Stanton fourth.

Match 13.—5 single birds:

Johnson	10111—4	Snow	11100—3
Wurms	10111—4	Kirkwood	10101—3
Cutting	10111—4	Graham	10001—2
Law	11100—3	Wilbur	01111—4
Stanton	11110—4	Francis	00111—3
Souther	01010—2	Miner	11111—5

Miner first, Stanton and Wurms second, Francis and Kirkwood third, Souther fourth.

Match 14.—3 pair doubles:

Francis	10 11 10—4	Wilbur	11 11 10—5
Kirkwood	10 10 11—4	Wurms	01 11 11—5
Stanton	10 11 01—4	Johnson	10 10 01—3
Snow	10 11 11—5	Graham	10 10 01—3
Law	10 11 11—5		

Law and Wurms first, Francis second, Graham third.

Match 5.—3 pairs double birds. 15yds. rise.

Kirkwood	101010—3	Howard	1110111—5
Wilbur	101010—3	Valentine	1101011—4
Wurms	111111—6	Johnson	1010111—4
Papanti	101111—5	Allen	1110104
Tinker	101100—3	Francis	1110104
Crandall	110111—5		

Wurms first, Howard, Crandall and Papanti second, Allen an Francis third, Tinker fourth.

Match 6.—7 single birds, 18yds. rise.

Kirkwood	0001111—4	Valentine	0111011—5
De Rochmont	0111010—4	Bartlett	1011011—5
Allen	1101110—5	Cutting	1101101—5
Howard	1111011—6	Wurms	1111111—7
Crandall	1111110—6	Miner	1100101—4

Wurms first, Crandall and Howard second, Valentine, Bartlett and Cutting third, Kirkwood fourth.

Match 7.—3 pairs doubles, 15yds. rise.

Kirkwood	111010—4	Wilbur	111010—4
Allen	101010—3	Howard	101111—5
De Rochmont	101001 - 3	Valentine	011100 3
Johnson	101011—4	Snow	001011 3
Wurms	111111—6	Francis	101110—4
Crandall	111110—5	D H Graham	111001—4
E W Law	110111—5		

Wurms first, Crandall, Howard and Law second, Wilbur third, Valentine fourth,

Match 8.—New England three-men team gold badge match. Teams of three men, 5 single birds from five traps, 3 pair double birds and 10 single birds from one trap.

Massachusetts Rifle Association.

Wurms	11111	10 11 11	1111111110—19
Law	01110	11 01 11	1100110010—13
DeRochmont	11110	00 11 00	0001101000— 9—41

Boston Gun Club.

Sawyer	01011	01 01 11	1110111111—16
Kirkwood	00111	11 01 01	1100100010—10
Johnson	11011	00 00 00	0110001100— 8—34

Shoot off for second money, 3 single and 1 pair double s.

Port Roseway		Narragansett.	
Francis	111 11—5	Tinker	111 10—4
Wilbur	111 01—4	Crandall	111 10—4
Howard	111 —3—12	Valentine	100 11— 3—11

Winners: Massachusetts Rifle Association first, Port Roseway Shooting Club second, Boston Gun Club third.

BUFFALO, June 6.—At the meeting of the Audubons this evening, nothing was done about the State shoot. The arrangements are at a stand for the present by reason of the scarcity of pigeons. The club will wait until the latter part of next month and watch for the nesting ground of the flock of young birds. If, by that time, the club finds there is no prospect of getting enough birds for the tournament they will discuss the feasibility of using clay-pigeons.

CONNECTICUT STATE SHOOT.

THE State shoot for the Ligowsky clay-pigeon medal was held on the new grounds of the Parker Gun Club, Meriden, June 1, and was won a second time by the Parkers. Twelve teams of four men each contested, and though it threatened to rain, as usual, and the day was cloudy, the attendance was larger than at any shoot this season:

Parker Gun Club.

Baker	1110010100111011100111101—16

West	0110101111111111111110101—20
Hanson	0101010010101011101 —12—54

For the individual medal, held by H. Nichols of Bridgeport, there were 30 entries, but only the following finished their scores, 50 pigeons, 18yds. rise: Birdsey 41, Nichols 40, Bull 40, Goodrich 41, Ives 38, Blakeslee 35, Adams 35, Longdon 34, A. Ives 34, Strong 33, Sterry 30, Dean 30, Penn 26. Tie shot at 5 pigeons. 21yds. rise, Birdsey 11010—3; Goodrich 10111—4. Before the match a sweepstake of 20 entries was shot in which Birdsey won first, Baker and Ives divided second, Nichols and Folsom third. Another of 27 entries, Strong and Nichols first, Folsom second, Minor and A. Ives third, Birdsey fourth.

DETROIT, June 14.—The Terra Cotta Club, a recent organization are having bi-monthly shoots for a medal, to become the personal property of any member winning it three consecutive times. The first shoot was won by Wm. H. W. Avery, who broke 19 out of 20 clay-pigeons. Mr. A. E. Brush won second, scoring 16 out of 20. The third shoot takes place next Thursday at Monroe, Mich., whither the club proceed upon the invitation of Hon. Harry A. Conant, Secretary of State, whose guest the club will be. The trip to Monroe will be made on Mr. Brush's elegant steam yacht Lillie. There are several crack shots yet to be heard from on the medal question, notably Mr. Geo. E. Avery, and young Mr. Gaylord. The latter shoots in fine form. He has not participated in the last two meetings, but is now on deck.—DELTA.

SAN FRANCISCO, Cal., June 8.—The much talked of match between Fay and Burbank, for $100 aside, at 50 single birds, 20yds. rise, and 80 fall, was finally settled at the Oakland race track to-day. The day was a most disagreeable one, there being a nasty, soaking rain all day, which not only made it bad for the visitors, but also prevented the birds from flying. The confidence displayed by Fay's friends in his capability of winning the present match was chiefly based upon a fine practice score he had made at San Bruno on Friday last, when he killed 40 out of 43 fast, strong birds. Slade acted as referee, and the veteran Rice pulled the traps. The following was the score:

Burbank	1110111111000111011111111111111111111101111101111—43
Fay	1101110101111111111111111111111111101011111111101—44

PAWTUXET, R. I., June 13.—Regular weekly shoot of the Narragansett Gun Club for silver trophies, at 10 pair of double clay-pigeons, 15yds. rise:

G J Crandall	00 11 11 11 11 11 11 11 11 10—17
E W Tinker	10 11 00 11 11 11 11 11 11 11—17
H D Mathewson	00 11 10 11 11 11 11 11 10 10—15
C M Sheldon	01 11 10 01 01 11 11 11 10 10—14
G F Butts	11 01 11 01 10 10 11 00 00 10—11
Mr Hayward	10 11 10 10 01 10 00 10 10 10—10
Tie—{ G J Crandall	10 11 11 10 11 11—wins first prize.
{ E W Tinker	01 11 11 10 01—wins second prize.

Ligowsky individual championship State badge, at 25 single clay-birds sprung from 5 traps, at 15yds. rise:

H D Mathewson	11111 11111 11111 11111 11111—25
G J Crandall	11111 11111 11111 11111 11111—25
E W Tinker	10111 11101 11111 11111 11111—23
G T Butts	01111 10111 11111 11111 11111—23
C M Sheldon	11101 11111 11111 10111 10011—20
Mr Hayward	11110 10110 11010 00010 11111—16

Mr. H. D. Mathewson wins badge for first time. This badge has been won nine times by our president, Mr. E. W. Tinker, and as the shooting ends July 1, he stands a sure winner.—H. W. S.

TROY, N. Y., June 11.—There was quite a contest between members of the Central Gun Club at Young's Park to-day, each shooting at 25 clay pigeons and 20 glass balls. Mr. N. Lewis, the rifle maker, broke 21 clay pigeons and 19 glass balls, 18 of the latter without a miss. This was thought pretty good for a man 75 years old.

BROOKLYN, June 10.—Acme Rod and Gun Club, of Brooklyn, N. Y., Dexter's Park, Cypress Hills, L. I., June 10; glass balls, screened revolving trap, for gold badge:

Short	1111011111011111101011—16
Keppel	1110111011011010111111—16
Schottler	0011101111011011011011—14
Knebel, Jr	1101011111100110100010—12
Betz	1011011111111000010010—12
Smith	0010011011111101100010—12
Linstedt	0111111001100100011—12
Munck	0110100110000011011111—11
Stark	1000101001100000101 0— 7
Pope	0001000100100010000 1— 5

Ties: Short—11111—6; Keppel—1110—3. The first annual picnic of this club will be held on Tuesday, July 15, at Euler's Broadway Park.—H. K.

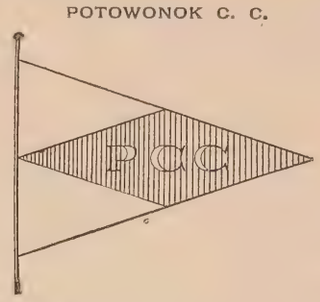
MERIDIAN, Miss.—A tournament has been arranged to take place here on June 17, 18 and 19. The various matches are open to the world, and will be shot under the auspices of the Meridian Gun Club, under standard rules. A full attendance will be on hand, principally rural shots from the surrounding country, with delegations from Selma, Montgomery, Mobile, and from New Orleans. On the first day there will be two matches at live pigeons, one at chimney swallows, one at clay-pigeons and one at glass balls. On the second and third days the erratic bat will be substituted, and the majority of the boys will get "left" while trying to draw a killing "bead." No such shooting has ever been done on bats as right here at home by members of the Louisiana Gun Club, who ought to put in an appearance at Meridian and show the boys how to kill bats

NEW ORLEANS.—Mr. Scooler, the jeweler, has donated a handsome silver bat, to be contested for in a series of two matches at the erratic "leather wing." The first to take place on Wednesday evening, June 18, and the second on the 25th, on Marengo street, back from St. Charles, shooting to be under rules of the Louisiana Gun Club, at handicap distances, from 20 to 25 yards, 20 bats (10 doubles) to be shot at in each match, and highest total score in both matches to take the handsome and very appropriate prize. Matches are open to all comers, and no entrance fee will be charged.

DETROIT, June 11.—The Michigan Gun Club held its monthly shoot at the Park House, Hamtramck, to-day, O. A. S. Haven putting up a handsome fishing rod as a prize for the winner. The shooting was at 20 clay-pigeons each and the following scores were made:

Donaldson	1 0 1 0 1 1 0 1 1 1 1 1 1 1 1 0 0 1 1 0—14
Stewart	1 0 1 1 1 0 0 0 0 0 0 1 1 0 0 1 1 1 1—10
Jardine	1 0 1 1 1 1 1 1 1 1 1 0 1 1 1 1 0 1 1 0—16
Langlois	1 0 1 1 1 0 0 1 1 1 0 1 0 1 1 0 1 0 1 0—12
Davis	0 0 1 0 1 1 0 1 1 1 1 0 1 1 1 0 0 1 1 0—12
Woods	1 1 0 1 1 0 1 0 1 1 1 0 1 1 1 1 0 1 1 1—15
Barbour	1 1 1 1 1 1 0 1 1 0 0 1 0 1 1 0 1 0 1 0—13
Larkins	1 0 1 1 1 1 0 1 1 1 1 0 1 1 1 0 1 1 1 1—16
Evans	0 1 0 1 0 1 1 1 1 1 1 0 1 0 1 0 0 1 1 0 0—11
Barnes	1 1 0 1 1 1 1 1 1 1 1 0 1 0 0 1 1 0 1 0 1—14
Schweikart	1 1 0 0 1 0 1 1 1 1 1 1 1 1 1 1 0 0 1 0 0—13
Worcester	1 0 1 0 1 1 0 1 1 1 1 0 0 0 1 0 0 0 0 0— 9
Gilman	1 1 1 0 1 1 0 0 1 1 0 1 0 0 0 1 0 0 1 0—10
Havens	1 1 0 1 1 0 1 1 1 1 0 1 1 1 1 0 1 0 1 0—14

Jardine and Larkins shot off the tie, and the former will go a-fishing with that rod.



CAPT. BOGARDUS is with the Wild West show at the Polo Grounds, this city.

ENGLISH PIGEON-SHOOTING BILL.—The bill to prohibit pigeon shooting passed the Commons and was defeated in the House of Lords. A new bill has been introduced forbidding the mutilation of birds before being liberated from the trap.

Canoeing.

CANOEISTS are invited to send us notes and full reports of cruises, club meets, information about canoeable waters, and other communications of interest.

POTOWONOK C. C.

P. C. C., Fort Madison, Ia. John Rix, Captain; J. W. Albright, Jr., Mate; C. H. Peters, Purser; W. H. Atlee, Secretary. Organized March, 1882. Signal, red and white.

CONNECTICUT RIVER MEET, MAY 30.

Editor Forest and Stream:

The second annual meet of the Hartford and Springfield canoe clubs, held at Calla Shasta Grove, six miles south of this city, May 30, 31 and June 1, 1884, was in every sense of the word a success. Thursday night three S. C. C. men and a cook went into camp, but in the morning we found an intruder occupying considerable room and, generally speaking, a perfect nuisance, by name Jack Frost.

Friday, at 9 A. M., we saw our guests, the H. C. C., sailing before a stong northwest wind, coming under the south end bridge, making a beautiful picture. Nothing unusual in the trip, except an upset, which was promptly attended to. Breakfast was served and from this time until sundown members of each club were arriving at camp until our shore was lined with thirty-five canoes, a fair showing for two clubs.

The camp photographer was early at work and many fine views obtained, especially the "first breakfast." Dinner having been disposed of the national game of base ball was set in the field, with very damaging results to some.

Owing to the strong northwest wind sailing races were postponed, and at 6:30 P. M. the paddling race was contested, five men from each club entering. At the finish, Messrs. G. L. Pratt and Paul Knappe, of the S. C. C. were declared winners of first and second prizes. It was none the less interesting to see Commodore Jones trying to defeat Vice-Commodore Hubbell, both H. C. C. men, for third place; but it was a cold day for the Commodore.

After supper, a regular old-fashioned camp-fire was held, around which a jolly crew of canoeists told stories, joined in a grand chorus, related their varied experience in canoeing matters, listened to the banjo concert by members of H. C. C., which was first-class, enjoyed every moment until the long hours closed in and good-night was sounded.

Saturday morning early the campers were up and preparing for the day's sport. First the cook favored us with hot beef tea; later a breakfast was served—coffee, oatmeal, potatoes, beefsteak, mutton chops, ham and eggs, etc. Then another game of base ball, at which lawyer Clark, of Hartford, astonished the natives with his scientific pitching, so that one, two, three and out was in perpetual order. Next came trials of speed—running, jumping, hop, skip and jump, throwing the weight, vaulting and general gymnastics. We must confess that Hartford is about one foot ahead. At 10 A. M. twenty canoes set sail for Springfield and enjoyed an hour in the city.

After their return and dinner served, the wind had dropped to southwest, coming up river a perfect gale; light canoes were soon ashore. Then Hartford sent out one of her men, only to be followed by an S. C. C. man to pick him up. Then an S. C. C. man viewed the bottom of his canoe until rescued. On account of the fury of the gale, all sailing races were postponed, and Com. Jones presented with first sailing prize.

At evening we were busy with our large craft bringing in men from the opposite shore, who came from Hartford by train to remain in camp over Sunday. A large company sat at table and enjoyed a hearty meal. Then camp-fire again, and canoeing in all manner of shapes was talked over. Considerable interest was manifested in the annual meet of the A. C. A. at Grindstone Island, and we hope to forward ten men from each club. Then three cheers were given for the second annual meet and for the success that has come from the original local meet in 1883 by the same clubs, which has met with universal favor throughout the United States.

The Hartford men have made rapid progress in the management and equipment of canoes, are thoroughly interested in the sport, make a run every Saturday afternoon and camp until the following Monday morning. For this Com. Jones should receive all praise; his energy and enthusiasm has been adopted by his club. A Hartford man retired after others in the same tent. He was talkative, you know how that is, his bedfellow was sleepy and did not enjoy the story, so he made his wide awake partner a lemonade, adding a few drops of chloroform—really you can't imagine how quiet that tent was in less than five minutes. Good scheme boys, book it.

Among those who arrived this P. M. was the famous Hartford photographer, Mr. Charles F. Stewart, and assistant, Mr. Graham. They brought a canoe camera, the plate-holder of which is 26×32in., and the camera—well, it would make a first-class Clyde tent. He proposes to take in the camp, etc., if it's possible.

We had all kinds and models of canoes. One Racine (which is for sale), a large number of Rushton, Stephens, Everson, Joyners and other makers. There were St. Pauls, Shadows, St. Lawrence, Rob Roy, Clyde, Stella Maris, Gruyling, Springfield, Eliard, Princess, double cruisers, and last, but not least, a Rushton sneakbox, which did not outsail any canoe that we know of.

This afternoon we received a call from two canoeists, one of the N. Y. C. C., the other a K. C. C., who had been to Springfield in their double canoe and were homeward bound. Sunday A. M. opened up fine as silk; warm, pleasant and agreeable to all hands. After breakfast Mr. Stewart erected his double-decked, fore-and-aft, three-story camera, mounted a ladder at the back door, and had hard work getting the focus of Mount Tom, twenty miles away. This having been accomplished, we were "set" in position, and flatter ourselves we formed a pretty fair picture.

Camp was lively all day, until the latter part of dinner, that solemn hour glides silently in every encampment when the time for saying good-bye arrives. It was then the fun was over and we all realized that the best of friends must part. Lawyer Clark, in a lively speech, congratulated the S. C. C. on their entertainment, and promised them a "bang up" time in the fall. The S. C. C. responded through the Commodore of the A. C. A. who can vouch for the hospitality enjoyed at the hands of the H. C. C.

At 3 P. M. the fleet started for Hartford. The almost deserted camp was soon made lively by arrival of friends overland from Springfield, and they were favored with a regulation camp fire. Monday, A. M., the S. C. C. broke camp, returned home only to find the shore side of their canoe house three feet out of water on the river bank.

Several hours' work with jacks and timbers placed her safely in the water. The thorough method of its construction proved itself a valuable investment in this case, for it withstood the terrible strain and is in good condition. Now prepare for the August meet of the A. C. A. at Grindstone Island, Aug. 1 to 15. Everybody on deck.

GERI.

KNICKERBOCKER C. C. REGATTA.

NO day could have been more admirably adapted for this occasion than Saturday last. The sun shone brilliantly, but there was a cool, invigorating vitality in the air that is as rare as it is delightful at this advanced season of the year. The neighborhood of the club house, always attractive, was at its best, and there are few more charming spots on the Hudson. To the north lies the boldly-jutting point crowned by the mouldering ramparts of Fort Washington; exactly opposite, the gray, spectral Palisades keep their eternal watch and ward; lower down are the picturesque bluffs and shaggy woodlands of Fort Lee, while the eastern bank is dotted with villas whose greensward creeps down almost to the water's edge. Through the midst

> "The river nobly foams and flows,
> The charm of this enchanted ground,"

winding its stately way from storm-swept mountain, quiet islet and rippling brook to the great unrestful city that seethes and labors at its mouth.

That river was ruffled by fierce but intermittent blasts from the northeast. Close inshore it was in comparative calm, alternately blackened by passing catspaws and gilded by the sun, but out in the middle the surface was constantly torn and whitened by the gusts, and along the further shore the white caps tipped angry, formidable seas.

Long before the appointed hour the river was dotted by canoes driven sturdily along by the paddle or wheeling in graceful curves beneath their snowy sails and the tiny flags that burnt in vivid tongues of color at their mastheads, each little craft experimenting in the varying and complex problem of wind, tide and current before its anxious captain.

A large number of spectators watched the races from their carriages or from the end of the adjacent pier. Here the resources of the club house were taxed to the utmost to provide camp chairs, whence "ladies' eyes rained influence" on the contestants. A hearty welcome was extended by the K. C. C. to a representation of the Neptune Club, of Newark; to Messrs. Childs and Root, of centerboard fame; Mr. L. W. Seavey, of the Kit Kat Club, and other well-known canoeists.

The first race of one mile paddling was called at at 3:30 by Mr. E. A. Hoffman, who officiated as clerk of the course in the unavoidable absence of Mr. C. G. King. It was hotly contested, Messrs. Greenleaf and Griffin coming in ahead of their respective classes.

When the sailing race for Classes A and B was announced, the wind, with the historic perversity of regatta weather, was hauling round to the south, and seemed to blow in sharp, fitful puffs from every quarter of the known world. The course was laid to windward and return, and seven canoes started, presenting almost every diversity of build and rig, from the Shadow to the Racine and from the balance lug to the leg-of-mutton. The race was a pretty one, the two rival Netties, sailed respectively by W. L. Green and E. Fowler, crossing the home line considerably in advance of their competitors.

In consequence of the lateness of the hour the combined paddling and sailing race was omitted. There were three entries for the tandem race, which was won, after and exciting mile dash, by Messrs. Greenleaf and Green. Subjoined are full particulars, with corrected time:

PADDLING RACE—DISTANCE 1 MILE.

	Class 2.	M.	S.
J. L. Greenleaf	Coquago	10	30
E. Gould	Idler	10	40
H. T. Keyser	Skip	11	14
	Class 4.		
E. C. Griffin	Marguerite	10	44
R. J. Wilkin	Tip	11	10

SAILING RACE—DISTANCE 1½ MILES.

	Class B.		
E. Fowler	Nettie	21	20
W. Dormitzer	Manche	27	30
R. J. Wilkin	Tip	28	36
E. E. Griffin	Marguerite	30	17
	Class A.		
W. L. Green	Nettie	23	07
J. L. Greenleaf	Coquago	27	33
A. A. Gardener	Red Rover	Not taken	

TANDEM RACE—DISTANCE 1 MILE.

J. L. Greenleaf, W. L. Green.	Tip	8	36
R. J. Wilkin, E. Gould.	Saskatchawan	8	39
W. Dormitzer, E. Fowler.	Red Rover	8	42

The Knickerbocker C. C. is rapidly increasing in size. There are thirty-two active members on its rolls and five applicants are now awaiting admission. A most prosperous career seems to be opening before it in its new home.

THE GALLEY FIRE.

CANOE AND CAMP COOKERY.

IV.—MEATS.

Broiled Steaks.—If the steak is tough beat it on both sides, but not enough to tear the meat and allow the juices to escape. Wipe a gridiron clean, heat it well over a bed of coals, and then put in the steak. Turn often, and if the drippings escaping into the fire cause the latter to blaze or smoke, withdraw the gridiron for a moment. Season, after it is done, with pepper and salt, and if a gravy is desired put a half teaspoonful of salt, half as much pepper, and a piece of butter or fat as large as a duck's egg into a hot dish, and add two tablespoonsful of boiling water. Pour it over the steak slowly, so that every part of the latter will be moistened.

Broiling in a Frying-pan.—Broiling can be done as well with a frying-pan as with a gridiron, and all the juices are preserved. Heat the pan very hot first, then put in the meat to be broiled, cover over with a tin plate, and turn the meat often in the pan.

Boiled Meat.—Put the meat into enough boiling water so that the former will be a little more than covered. Cover the pot and boil till cooked, which will take about fifteen minutes for every pound of meat. Skim constantly while boiling, and turn the meat several times. Replenish when necessary with boiling water. One teaspoonful of salt for each five pounds of meat should be put into the pot a short time before the meat is done. If there is a layer of fat on top after the meat is cold, remove it. Beef or venison fat may be used for frying.

Baked Deer's Head.—Build a fire in a hole in the ground. When it has burned to a good bed of coals put in the deer's head, neck downward, with the skin on but the eyes and brains removed. Cover with green grass or leaves, coals and earth, and build a new fire on top of all. In about six hours exhume the head, remove the skin, and the baking is complete. This method of baking applies as well to the head of any animal.

Fried Salt Pork (or Bacon).—Good salt pork is smooth and dry. Damp, clammy pork is unwholesome. Slice thin, put in frying-pan with cold water enough to cover, let it come to a boil and boil two or three minutes; then turn off the water and fry brown on both sides; or, soak one hour in cold water then roll in bread or cracker crumbs and fry with a little butter or lard in the pan.

Broiled Salt Pork.—Slice thin, and broil same as steak on a gridiron or on the end of a green switch held over the coals, using extra care that the smoke and flame from the drippings do not reach the pork.

Boiled Pork.—Soak over night in cold water and put into a pot of cold water over the fire when the boiling begins. Boil same as other meat and save the cake of fat that rises when it is cold for frying purposes. Turnips, cabbage, potatoes and greens are good boiled with pork. (See table for boiling vegetables in a future paper).

Baked Pork and Beans.—A camping friend of mine takes two nights and a day to bake pork and beans, and as his beat any "Boston baked beans" that were ever canned, I give his method. In the evening he picks over, say, two quarts of beans, washes them, and soaks them in cold water until the next morning. Then he parboils three pounds of salt pork and cuts it into thin slices. The soaked beans are drained and put into a pot with enough cold water to cover them and a teaspoonful of soda, the pot is covered, and they are boiled briskly for a quarter of an hour, the scum being removed as it rises. Then the water is poured off, fresh boiling water is put in the pot, and they are boiled with the cover on till tender. This is the time when I get tired and hungry, and eat the beans and pork without baking, but my friend digs a hole and builds a fire in it, as for all camp baking, puts one-half the beans into the bake kettle (or bake

basins, described before), lays over them the sliced pork, over that the rest of the beans, pours a half pint or so of boiling water over them, and (it being by that time sundown) buries them, tightly covered, among the coals, and goes to bed. At daybreak they are done.

Hash.—Four pounds of cold boiled meat (not pork) or corned beef, free from bone or gristle, one large parboiled onion, and two pounds of boiled or baked potatoes are chopped and mixed together, seasoned with pepper and salt, and stirred up with about a pint of hot water. Put enough lard or butter into a frying-pan to well cover the bottom when melted, and when it is what "Nessmuk" would call "screeching hot," put in the hash. Stir it for a few minutes, then let it fry till it is brown on the bottom. Corned beef hash requires little salt for seasoning.

Ham and Eggs.—Fry the ham first the same as pork or bacon, and fry the eggs in the fat left in the pan. Break each egg separately into a cup, and thence transfer it to the pan, by which means the yolks are kept intact and bad eggs are discovered before it is too late.

SENECA.

NEWBURGH RACES.—59 Bank Street, New York, June 10.—*Editor Forest and Stream:* In your edition of the 5th inst. you have the Tip, R. J. Wilkin, K. C. C., as coming in last in the paddling race against the Snake. Aurora and Mosquito. I would beg of you to correct the same, as neither the Mosquito nor Tip were in that race. I entered but one race, and gained second place in that in a boat I had never before been in till the night previous.—TIP.

ROCHESTER C. C.—The summer races of this canoe club will take place on Irondequoit Bay this afternoon. The course laid out is between the club house and the Newport House. The entries will be about twenty in number, and the prizes, given by members of the club, will consist of silver cups, flags, watches, headlights and camping outfits.

NEW YORK C. C.—The spring races of the N. Y. C. C. will take place on Saturday, June 21, at 3 P. M., off the club house, Staten Island. Visitors can take the North Shore Ferry to New Brighton, or the South Shore to Tompkinsville, the canoe house being between the two. Both ferries start from the foot of Whitehall street, New York.

Yachting.

NEW YORK Y. C.

THE New York Y. C., on the occasion of their annual matches on Thursday last, were blessed with even worse weather than that which disappointed the Atlantic Y. C. on the previous Tuesday. The day opened with heavy clouds and light wind from the east, with a thick fog during a part of the time, clearing as the afternoon advanced, but at no time with sufficient wind to make an exciting race.

Twenty-three yachts were entered, all but two (the Lotus and Bedouin) starting, the latter withdrawing on account of a death in her owner's family. The keel schooners and Class 1 centerboards had no entries, those in the other classes being:

SECOND CLASS SCHOONERS.

Name.	Measurement. Ft. In.	Allowances,—Club Prizes. M. S.	Challenge Prizes. M. S.
Montauk	93.8	Allows	Allows
Grayling	85.8	4 17	4 17
Crusader	84 5	5 02	5 02
Estelle	81.8	6 40	6 40
Clytie	80 6	7 25	7 25

THIRD CLASS SCHOONERS.

Clio	68.8	Allows	15 47
Triton	64.8	3 21	19 08

FIRST CLASS SLOOPS.

Gracie	71.6	Allows	Allows
Fanny	69.7	1 28	1 28
Ileen	65 8	4 49	4 30
Mischief	65.2	5 10	5 10
Hildegarde	64.2	6 02	6 02
Wenonah	63.4	6 46	6 46
Whileaway	57.5	12 30	12 30
Athlon	56.4	12 39	12 39

SECOND CLASS SLOOPS.

Isis	54 2	Allows	16 14
Oriva	53.8	0 29	16 43
Eclipse	—	—	—
Fanita	49.5	5 46	22 00
Vixen	48.6	6 58	23 12
Espirito	47 5	8 28	24 42

The course was from a line between the judge's boat and a markboat near buoy 18, off Owl's Head, thence to and around No. 10, passing to west and south of it, thence to buoy No. 8½, passing south of it, north of buoy No. 5, to and around Sandy Hook Lightship, and returning over the same course to a stake boat off buoy 15 on the West Bank.

A prize was offered in each class, provided two or more yachts start, besides a prize for keel schooners, and the Bennett challenge cups for schooners and sloops.

By 10 A. M. besides the judge's boat, Luckenbach, with Messrs. Tams, Stebbins and other members of the club aboard, there was a fleet of steamers off Bay Ridge, the Taurus, with members and guests of the club, Columbia with a crowd of spectators, the Grand Republic with an excursion on board, and of the yachts Stranger, Corsair, Atalanta, Natalie, Gleam, Sentinel, Tillie, Promise, Theresa, Vision, Marina, Angler and several tugs.

At 12 A. M., by which time the yachts were all near the starting line, a thick fog shut in, with hardly any wind, the tide then having turned down. At the first whistle, 11:21, the Wenonah and Grayling were near the line, the rest of the fleet being scattered above it, the sloops with club topsails set over working topsails, the cutters with club topsails only.

The starting whistle blew at 11:31, and three minutes later Ileen passed slowly and gracefully over the line with boom to starboard, running up jibtopsail as she approached. Clytie followed, then Gracie, with Fanita and Oriva across together, the last whistle, at 11:41, finding Mischief and Clio abreast, both handicapped, with Fanny and Montauk astern, and Hildegarde last of all.

Ileen	11 34 00	Wenonah	11 39 09
Clytie	11 34 21	Whileaway	11 39 19
Gracie	11 34 48	Athlon	11 39 58
Fanita	11 35 00	Vixen	11 40 24
Oriva	11 35 00	Triton	11 40 39
Estelle	11 36 07	Clio	11 41 33
Eclipse	11 36 39	Mischief	11 41 43
Crusader	11 37 35	Fanny	11 42 05
Grayling	11 37 59	Hildegarde	11 42 34
Isis	11 38 37	Montauk	11 42 34
Espirito	11 38 53		

Mischief set spinnaker on the line, most of the others following, some of them starting with spinnakers to starboard and having to shift them.

The tide carried them down, there being but little wind and above the forts they loomed up like a procession of ghosts in the fog, the fleet being rather curiously in the shape of a letter L, one line down the Long Island shore, Ileen well ahead with half a dozen strung out behind her, while at the end of the line a part of the fleet, one abreast of the other, made the bottom of the L, extending across the Narrows.

At noon the fog lifted a little, at 12:09 Ileen passed Fort Lafayette, and there came some streaks of wind that broke up the geometrical order of the procession. Athlon first with clubtopsail and balloon jib started ahead of the pack, helped by a puff from the west, taking a foremost position, Ileen still leading to leeward, Gracie, Clytie and Mischief being well up to the front, Wenonah on the latter's lee beam. Fanny and Fanita tried a little bout at luffing, the former proving victorious, when the wind fell, and at 12:40 the order was Fanny and Athlon abreast to windward, with Ileen to leeward and Gracie, Clytie, Wenonah and Mischief between. All now stood over toward Coney Island Point, with a southwest wind. Ileen well in the van, Clytie, Wenonah, Gracie and Athlon in pursuit, Mischief and Fanita close behind with Hildegarde and Oriva well under their lee, Isis astern in company with the big schooners. Athlon here did the best work of all the pursuers, and off the point was in hot chase of Ileen, who was going like a steamer under a fresher breeze that she had felt all day.

At 1 o'clock Ileen went on port tack and stood for the buoy, Clytie being second about and Gracie third, the rest soon following, with a breeze from southwest. Up to this time Ileen had been doing splendid work, and had put a mile between her and the pack; but standing well off to the eastward, a sudden shift of wind lost her all her advantage and tumbled Fanita into first place near the Romer Beacon, with Mischief and Wenonah, who had been making a good fight all day, close to her.

All on the tug had been eagerly watching the varying chances of the yachts to the eastward of them, when suddenly a shout of "Look at Vixen," caused all to turn to the west, where, near the buoy, was a small sloop that had hitherto been unnoticed. A glance showed that she was not Vixen. But who was she? Nobody knew; but she was finally identified as Espirito, a boat new last year and little known. Her skipper, an old pilot, had quietly stood up over the west bank, on a course of his own, and with excellent judgment had struck a strong ebb there which carried her down on the buoy in almost a calm.

At the buoy were a group of steamers, yachts and tugs awaiting the yachts, and by the time the Luckenbach had joined them, Espirito was about to luff, going round on port tack with gafftopsail and balloon jib set, taking in the latter and setting jib to the accompaniment of an infernal chorus from all the whistles within a mile, the melodious bellow of the Luckenbach echoing above all the others. Clytie came round next, Eclipse third, and the rest as below, all soon being scattered again in the beat off the point of the Hook.

Espirito	2 31 19	Hildegarde	2 50 01
Clytie	2 35 13	Vixen	2 50 24
Eclipse	2 40 17	Athlon	2 50 49
Wenonah	2 41 24	Gracie	2 51 38
Crusader	2 42 21	Oriva	2 52 05
Mischief	2 44 51	Whileaway	2 53 42
Fanny	2 45 44	Clio	2 56 38
Montauk	2 46 19	Isis	2 58 56
Grayling	2 47 31	Estelle	3 00 58
Fanita	2 48 49	Triton	3 02 24
Ileen	2 49 23		

At 3:30 Espirito still lead, but Wenonah had second place, half a mile astern, with Clytie half as far behind her, and Gracie fourth. Fanny, Ileen and Mischief were standing down in the order named. Ileen at 3:45 trying to pass through Fanny's weather. The rest were well strung out along the beach, Athlon and Fanita standing in on port tack, the others mostly on starboard, with a fresh southeast wind. At 4:10 a fog came up very suddenly, shutting out everything for a few minutes, but it lifted as quickly, showing the yachts in nearly the same order. Athlon and Fanita in together near the beach were at it, hammer and tongs, neither having much the best of it at any time. Hildegarde did little of note thus far, being sailed very close all day, but Ileen was pointing up in a way worth seeing.

Off the lightship there was no wind to speak of. Wenonah came about on port tack at 4:50, Mischief 4:52:50, rounding the lightship as below:

Mischief	4 55 12	Oriva	5 02 33
Athlon	4 55 57	Crusader	5 03 08
Fanny	4 55 59	Grayling	5 05 08
Fanita	4 57 19	Hildegard	5 07 43
Montauk	4 58 29	Whileaway	5 11 45
Ileen	4 58 29	Eclipse	5 12 19
Wenonah	5 00 03	Clytie	5 13 26
Espirito	5 00 36	Isis	5 13 41
Gracie	5 01 10	Triton	5 16 58
Vixen	5 01 21	Clio	5 18 06

Athlon did a pretty piece of work on the turn, Ileen gave way for Montauk, rounding immediately after her, and Clytie nearly picked up Isis on the end of her jibboom, by which time the rest were well on the way home, the kites all spread to the light southeast wind.

At 5:10 Wenonah lost all her kites in a moment, as it proved, by losing the head of her topmast, and was out of the race. All went merrily up for the Hook with clear sky, bright sunlight and a tearing flood tide; Mischief and Fanny neck and neck, Athlon some distance astern, Montauk fourth, Gracie fifth and Fanita hanging well to her lee quarter, while Crusader, Oriva, Grayling, Ileen and Vixen were in a pack astern.

Fanny now led Mischief to the point of the Hook, where, at 6 P. M., the wind fell, and the question was asked anxiously by all hands, "Will they make the race in the time?" eight hours being the limit for all classes or no race. After drifting in a calm for ten minutes a puff came out of the west, Mischief's crew walked away forward with the sheet, and as they did so she started as though they were pulling her bodily, passing Fanny, who as yet hardly moved.

At Buoy 10 the chances of a race were but small, Mischief coming up ahead, rounding slowly, and starting off a little as her blocks were brought quickly together. Athlon now was after Fanny in a way that promised that she might save her time from the pair, but in the light wind it proved a hopeless task, and it was soon seen that even Mischief could not make the race.

Mischief	6 33 17	Gracie	6 45 39
Fanny	6 33 33	Montauk	6 47 18
Athlon	6 37 03	Grayling	6 49 22
Fanita	6 45 01		

Up the Bay the order was little changed, Fanny's spinnaker set at 7 helping her a little; the tug ran up quietly in the twilight, stopped for a few minutes and at 7:41 a long whistle announced to the leaders, still a mile or so away, that the eight hours had expired. Back went the Luckenbach in the increasing darkness, hailing Mischief first: "No race; ready at 11 to-morrow." "All right, sir," then away to Fanny and Athlon, Montauk and Gracie, and down to the rest coming up slowly. All were anxious for another trial, but when in the rear Wenonah's broken topmast was made out a voice asked eagerly, "Do we try again to-morrow, sir?" "Yes," a cheer went up from all hands forward with a heartiness that showed how keenly they felt their disaster. On steamed the tug through the slowly moving green and red lights toward the numberless white ones beyond; soon the fleet was seen dimly outlined in the Narrows, and the race that was no race was over.

As far as its effect on the main question at issue is concerned, the race so long looked forward to was of little value, no conclusive results being possible when, at three or four times during the day the contestants were distributed about as much according to their size and merit as though they had been emptied from a bag. Light and fluky winds had spoiled a day for the finest fleet of sloops and cutters the New York Y. C. has ever brought together.

FRIDAY, JUNE 13.

The clear weather of the preceding evening was followed by another cloudy day with a drizzle in the morning that gave little indication of what it proved finally to be, a day of the grandest yachting weather that has honored the spring races of New York yachtsmen in a long time. None of Tuesday's light winds or Thursday's disappointments and flukes, but a day to test gear and rigging; when topmasts were best housed and spinnaker booms ashore, a day too to test the metal of the sailor men of sloops and cutters, as well as their respective boats. A rattling breeze over all the course, wet jackets for everybody, a beat to windward that made it no child's play, with a struggle for first place which made it worth having.

Of the 21 starters on Thursday, 5, Crusader, Triton, Whileaway, Isis and Espirito, were missing when the starting whistle blew at exactly noon, the first whistle sounding at 11:50. The rain then had ceased, though the sky in every direction was covered with a dull heavy cloud. The tide had just begun to ebb and the wind was so light from the northwest that light sails were spread everywhere. The pleasure fleet of the previous day was nowhere visible, and the few aboard the tug were the only witnesses of one of the finest struggles known to American yachtsmen. The first across was the schooner Estelle, next Clytie, Ileen, Fanita, Hildegarde, Oriva, Montauk, Clio, as follows:

Estelle	12 01 44	Eclipse	12 08 05
Clytie	12 02 28	Grayling	12 09 07
Ileen	12 04 01	Fanny	12 09 13
Fanita	12 04 12	Vixen	12 10 01
Hildegarde	12 06 44	Gracie	12 10 01
Oriva	12 07 03	Wenonah	12 10 15
Montauk	12 07 42	Mischief	12 10 30
Clio	12 08 01	Athlon	12 11 26

Ileen opened the ball with Fanita as partner in a pretty but very brief luffing match, in which the former showed what she could do when she tried. The big schooners, the rear guard on Tuesday and Thursday, had their turn at last, and started to show the way to No. 10 with a beam wind and a lively bubble in the Narrows, growing worse as they went down, the sloops this time following instead of leading. Club topsails soon came down, spinnakers went below and staid there, and topmasts were struck as well. No loitering to-day, the run that took three hours yesterday was made in one, and at 1:04 Montauk rounded.

Montauk	1 04 00	Gracie	1 11 35
Grayling	1 06 28	Mischief	1 15 20
Clytie	1 06 48	Wenonah	1 15 50
Estelle	1 07 15	Vixen	1 15 50
Clio	1 09 56	Fanita	1 16 55
Fanny	1 10 05	Oriva	1 17 20
Ileen	1 10 05	Athlon	1 18 55
Hildegarde	1 11 00	Eclipse	1 19 50

Montauk had her nose outside the Hook first, with Grayling close behind. Now, if ever, was Ileen's chance—really her maiden race—and well she improved it. On the previous day her own crew of four before the mast were helped out by Muriel's men, all cutter sailors, but to-day her extra men were recruited alongshore, new to the boat, and lacking of course the careful drill needed in a successful racing crew. Once outside, however, she settled down in earnest for the work before her. Hildegarde slipped astern of her somehow in a very short time, while Fanny had to be content with a place on her lee quarter. Fanny finally worked up again, Hildegarde, however, still being last of the trio, Gracie astern of her, and Wenonah in hot chase for a place at the top.

Meanwhile the schooners were hard at it, Montauk well ahead, Grayling second, Estelle to leeward, Clytie astern of her and Clio last of all. Fanny had gained on Ileen a little, but found her jib too much for her; working under staysail Ileen finally passed her at 3:24, having left Gracie under her lee at 2:16, the latter also having taken in her jib.

By this time there was a sea that kept the sloops jumping and tossing about in a way that suggested the propriety of a speedy return to smoother waters. Fanita had had enough some time before, Athlon did not want any more and Mischief was more than satisfied with her port chain plates started off, so all were off for the Hook, Estelle and Clio, the latter with bobstay and bowsprit shroud parted.

Oriva all day had been at her work steadily, having her old adversary, Vixen, against her, and now was doing good work in the beat to windward. Only three boats were timed at the Lightship: Montauk, 2:45:22; Grayling, 2:55:26; Ileen, 3:06:28; the order of the others being Clytie, Fanny, Gracie, Wenonah, Hildegarde, Oriva, Vixen, Eclipse.

To-day the schooners were home far ahead of the others. Montauk started up, with Grayling astern, passing Buoy No. 10 at 3:46:50, finishing off Buoy No. 15 at 4:23:09. Ileen held her own well on the run up as far as Buoy No. 10, but when sheets were flattened both Gracie and Fanny passed her, all finishing as follows:

SECOND CLASS SCHOONERS.

	Start.	Finish.	Elapsed.	Corrected
Montauk	12 07 42	4 23 09	4 15 27	4 15 27
Grayling	12 09 07	4 38 40	4 29 33	4 25 16
Estelle	12 01 44	Withdrew.		
Clytie	12 02 28	5 04 11	5 01 43	4 54 18

THIRD CLASS SCHOONERS.

Clio	12 08 01	Withdrew.		

FIRST CLASS SLOOPS.

Gracie	12 10 00	4 59 08	4 49 08	4 49 08
Fanny	12 09 13	4 58 08	4 48 55	4 47 27
Ileen	12 04 01	5 01 25	4 57 24	4 52 45
Mischief	12 10 00	Withdrew.		
Hildegarde	12 06 44	5 09 16	5 02 32	4 56 30
Wenonah	12 10 00	Disabled.		
Athlon	12 10 00	Withdrew.		

SECOND CLASS SLOOPS.

Oriva	12 07 03	5 24 44	5 17 41	5 17 41
Eclipse	12 08 05	Withdrew.		
Fanita	12 04 12	Withdrew.		
Vixen	12 10 00	5 37 27	5 27 27	5 20 58

Wenonah parted two of her port shrouds and was out of the race on the run home, while Vixen lost a boat which was stove at her davits. Montauk wins the club prize and Bennett cup, Fanny wins the same prizes in her class, and Oriva wins her class prize.

JERSEY CITY Y. C.

THIS club held their twenty-sixth annual matches on June 11, the courses being for classes A and C, starting at stakeboat between Bedloe's and Ellis Islands, around buoy 8½ on Southwest Spit and return. Class D, around buoy 14 in the Lower Bay. Classes G and H, twice around Robbin's Reef. The wind was light from northeast at the start at 11 A. M.

The entries were:

CLASS A—CABIN YACHTS.

Name.	Owner.	Ft.	In.
Linda	H. C. Roome	43	2½
Middy	Dr. J. H. Vondy	37	7

CLASS C—CABIN YACHTS.

Wabasso	G. L. Winn	27	7½

CLASS D—OPEN SLOOPS.

Knight Templar	G. A. Bowker	30	6
Alex. Forsyth	Alex. Forsyth	29	2¾

CLASS G—OPEN SLOOPS.

Fay	F. C. B. Ancher	30	2¼
Hoodoo	Owen Farley	19	11¾

CLASS A—CAT RIGGED.

Annie Forsyth	Alex. Roe	17	7½

All went over with booms to port, as follows:

Annie Forsyth	11 01 00	Knight Templar	11 06 00
Middy	11 04 30	Linda	11 07 07
Wabasso	11 05 00	Hoodoo	11 08 00
Alex. Forsyth	11 05 30	Fay	11 08 30

In the Narrows the wind, by this time southeast, made a lively jump as it drove against the ebb tide. Wabasso gave up and returned, but Middy and Linda were making a close race.

The Class D boats were timed at Buoy No. 4, the Forsyth at 12:33:27, and the Templar at 12:35:20, after which they started home.

At Buoy No. 8½ Middy led round at 12:57:30, with Linda at 1:02:05.

Coming home the wind was at northeast again, all coming up close-hauled, the full time being:

CLASS A—CABIN YACHTS.

	Start.	Finish.	Elapsed.	Corrected.
Linda	11 07 00	3 24 03	4 17 03	4 17 03
Middy	11 04 30	3 14 00	4 09 30	3 52 37

CLASS C—CABIN YACHTS.

Wabasso	11 05 00	Did not go course.		

CLASS D—OPEN SLOOPS.

Knight Templer	11 08 00	3 08 30	4 00 30	4 00 30
Alex. Forsyth	11 05 30	2 48 10	3 42 40	3 40 38½

CLASS G—OPEN SLOOPS.

Fay	11 08 30	3 05 25	3 56 55	3 56 55
Hoodoo	11 08 00	2 47 45	3 39 45	3 38 00

CLASS H—CAT RIGGED.

Annie Forsyth	11 04 00	3 18 05	4 14 05	4 14 05

HUDSON RIVER Y. C.

THE twelfth annual matches of the Hudson River Y. C. on Monday, June 16, brought out nineteen boats, enough entering in each class to make a race. The wind was from northeast, making a beat up the river and a run down, the course being from the club house around a markboat off Yonkers and return for the larger boats, Class E turning a stakeboat off Spuyten Duyvil.

CLASS A—CABIN BOATS.

Name.	Owner.	M.	S.
Howard	E. H. Hatch	Allows	
Emilie	J. Schmidt	40	20
Lottie	John Drew	50	20

CLASS B—OPEN SLOOPS.

Woodpecker	J. Moye	Allows	
Clara S	J. Stiger	1	50

CLASS C—OPEN SLOOPS.

H. H. Holmes	A. L. Kreymeyer	Allows	
Frank Oliver	W. H. Arnis	1	10
Selena C	J. McCarty	1	20
Julia G	M. Flynn	0	10
Sarah B	Jas. Buck	0	05

CLASS D—OPEN SLOOPS.

B. Goodwin	T. Muller, Jr	Allows	
Why Not	O. Chatfield	0	05
Wulie	C. Roth	0	20
Julia B	S. Bridge	2	10
W. Trankle	J. Kaufer	2	10

CLASS E—CAT RIGGED.

Ada	Lewis Wolfe	Allows	
B Flat	J. W. Browning	0	52½
Edith	Fred Geggus	2	30
Owl	Aug. Hermann	3	00

The times of starting were:

Clara S	11 41 55	Julia B	11 45 45
Howard	11 42 20	Willie	11 45 55
Emilie	11 42 40	W. Trankle	11 46 00
Lottie	11 42 50	B Flat	11 47 12
Woodpecker	11 43 00	Owl	11 49 55
Selena C	11 43 25	Edith	11 50 55
Julia G	11 43 50	H H Holmes	11 51 00
Frank Oliver	11 43 53	Why Not	11 51 00
Sarah B	11 44 30	Ada	11 51 00
B Goodwin	11 45 00		

Beating up Clara S, Selena C and Lottie made a close fight, the Clara being first to jibe for home. The Frank Oliver capsized on the way up, but was towed in without any damage, and Edith was disabled and returned. The times at the mark boat were:

Clara S	1 54 30	Willie	1 58 55
Lottie	1 54 50	Holmes	2 03 15
Selena C	1 55 15	Emelie	2 08 35

All came down the wind in a hurry with booms to port, the leaders being well together at the finish, with the pack strung out astern.

CLASS A—CABIN BOATS.

SEAWANHAKA CORINTHIAN Y. C.

IT was very unfortunate for the Seawanhaka Y. C. that their races followed so close on the two of the N. Y. Y. C., coming in between them and the Long Island race of Monday. Several of those who were out on Friday were disabled, crews were tired out, and on the others time was needed to prepare for Monday, so that of fourteen entries but eight started. The wind and water were but a repetition of Friday, with addition of a clear sky. Fanny, Mischief, Ileen, Grayling, Crusader and Vixen were missing, Isis taking the latter's place.

The course was from Fort Wadsworth around Buoy No. 10 and Buoy No. 8½, thence to and around Sandy Hook Lightship and return over the same course to Buoy No. 15, the fourth class sloops only going around Buoy No. 5 at Sandy Hook. The Luckenbach was on hand as usual with Messrs. Bayard, Suydam and De Luze, the regatta committee, on board; the Sirius carried the members and guests of the club, and Sentinel, Gleam and Marina came out to see the start.

Topmasts were housed on all except Amazon, one, and on some two reefs turned in, and Ray sent both topmasts ashore.

The starters were but eight, as follows:

	Length.	
SCHOONERS.		
Clytie	85.00	New York
Ray	62.00	Seawanhaka
FIRST CLASS SLOOPS.		
Gracie	78.02	New York
Athlon	56 06	Atlantic
SECOND CLASS SLOOPS.		
Oriva	60.83	Seawanhaka
Isis	61.25	Seawanhaka
FOURTH CLASS SLOOPS.		
Petrel	39.54	Seawanhaka
Amazon	28.03	Atlantic

At 11:33 the first whistle sounded, the Luckenbach being then on a line with the middle tower of Fort Wadsworth, and five minutes later the starting signal was given. Athlon was first to cross on port tack under staysail and single reefed jib. "Stand by for Isis," called out the timekeeper, as the new cutter was seen close to the line, but before she could cross, Oriva, with one reef and jib, swooped down between her and the tug, and handled beautifully, ran through her weather and crossed ahead of her. Gracie was late, having stopped to tie in second reef, having also jib and staysail set. Grayling ran down with the others, but soon turned back. The times at the start were:

Athlon	11 40 18	Amazon	11 43 15
Oriva	11 42 00	Petrel	11 47 10
Isis	11 42 05	Gracie	11 50 40
Clytie	11 42 46	Ray	11 52 50

The little fellows, Petrel and Amazon, snugly reefed, were bobbing up and down, the former soon ahead. Amazon parted the shackle of her weather shrouds when below the forts, both shrouds coming down. As it was found impossible to repair the damage, the mainsail was lowered, and she ran under head of jib into Perth Amboy. At 12:07 Gracie's staysail came down, while Oriva, with tack triced up, was well ahead, Athlon next and Isis third. The bay even here was all in a tumble, with a promise of still more outside. Off the Upper Middle buoy Isis passed Athlon and led for a short time. Smoother water was found at buoy No. 10, and Oriva and Athlon, after rounding, stopped for second reefs.

Oriva	12 41 16	Athlon	12 44 25
Clytie	12 46 46	Isis	12 43 52
Gracie	12 43 40		

While lying under the Hook, Petrel appeared alone, Amazon being long out. She ran under the Point, anchored, repaired a tear in her mainsail, her crew dined, and started on again around buoy 5 in time to go home with the big ones.

At 1 o'clock Oriva and Athlon were busy with second reefs, while Gracie kept on, passing both and gaining quite a lead on them. Rounding the Hook Gracie was butting into the seas, throwing spray all over her, while Oriva with a steady swing went through them at a pace that was taking her rapidly to the front, and at 2:15 she had Gracie under her lee, gaining on her steadily from there to the Lightship.

By this time there was fun on the tug as the big seas came in, green and solid, on the bar. Down she went and up again, now and then taking a sea over her stern and soaking all on the after deck, and once, with a roll to port, sending stools, tables and passengers into the leecuppers, but once over the bar the seas were longer and less vicious, more attention was paid to the yachts and less to personal interests. Ray had been in sight of until now, when she was seen astern, heading up and making good weather of it but going slowly over the ground, evidently bound on going over the course, though all alone, Clytie having turned and given up just before with a broken bobstay. Isis soon followed, seeing which Athlon turned tail and made for the Hook also, leaving Oriva and Gracie to fight it out alone. It was clear over head but wind and water were both cold for a June day, and there was no place for any but thorough sailors outside the Hook. On the beat out all Oriva's good qualities were seen and appreciated, as she not only left big Gracie with her 21ft. of extra length astern but did it all in a way that was doubly to her credit. Probably no other yacht in New York waters has been so heartily abused as Oriva, the first large cutter built here, and the name she has gained in the past two seasons, with the added victories of Friday and Saturday, are due no more to her than to the careful handling and thorough seamanship of her owner and skipper, a true Corinthian in every way. At the Lightship her time was 3:06, with Gracie one minute later, the latter jibing at once as she rounded, while Oriva stood in to catch the early flood up the beach, jibing further in shore and shaking a reef out. Running before wind and tide the seas were lighter and more to Gracie's taste, and size of course began to tell. Oriva was now under single reef, but losing ground, rounding Buoy No. 10 at 4:24:09, Gracie having turned at 4:22:04.

When last seen Ray was hanging on bravely, still well to leeward of the Lightship. Coming up the Bay, Bedouin met the leaders, standing up grandly under lower sail, and looking ready in every way for Monday's fight.

Petrel was also sighted, under double reefed mainsail and reefed staysail, going along easily and steadily. Gracie passed the line at 5:08:29, Petrel at 5:04:15, and Oriva at 5:12:43, Ray not being timed.

Jerseys and oilers were changed for shoregoing clothes and the tired sailors were picked up by the Luckenbach off Stapleton, but in spite of frock coats, linen collars and such disguises, it was easy to pick out the sailor men from the crowd on the tug, by the salt-encrusted faces, and hands that showed traces of an intimate acquaintance with wet ropes. The crews of the winning boats were:

Sloop Gracie.—R. Frederic Tams, captain; John E. Roosevelt, O. D. Lovell, Sidney Chubb, William M. Wright, Alfred Roosevelt, W. Emlen Roosevelt, J. N. Winslow, T. A. Bronson, E. Randolph, Jr., C. Randolph, H. Earle and Albert Meredith.

Cutter Oriva.—C. S. Lee, captain: A. B. Alley, R. C. Cornell, A. B. Simonds, W. Simonds, A. P. Montant, C. L. W. Eidlitz, Harold Sanderson, W. S. Alley, L. D Oremieulx and G. Villamoy.

Schooner Ray.—Vice-Commodore W. W. Tompkins, captain; J. M. Breese, mate; C. H. Leland, F. L. Leland, J. Lentilhon and W. H. Colburn.

Petrel.—J. Hyslop, captain; Benj. Tuzo, E. A. Stevens, Thos. E. Brown, A. Stevens.

SPRING MATCHES ON NEW YORK BAY.

BESIDES half a dozen matches of the smaller clubs, New York has had during the past week four races, in which most of the larger sloops and cutters, with some of the best known of the schooners, have entered, and the results, though unsatisfactory in some respects, must be of value to all yachtsmen.

Of course the main interest centered on the sloops and cutters, the latter having a far better representation than ever before. Ileen as yet untried, Bedouin and Wenonah altered during the winter. Oriva in good shape as usual, while the new Isis, which appeared for the first time, has been looked forward to with great interest by yachtsmen of moderate views.

The most important of all the separate points involved in the great controversy that has divided yachtsmen during the past five years has been, of course, displacement, and intimately connected with it, that of depth as a factor of safety. Moderate beam, low ballast, double jib, keels, housing spars, loose mainsail, reasonable rig—valuable as they all are—have been subordinate to this main point, which is now conceded by almost universal practice as definitely settled, the old theories of light displacement and draft being abandoned in New York and still more in Boston.

The change going on steadily season by season, of lead for iron, outside ballast in place of inside, on all classes of yachts, decides that point finally; double head rig is now the rule and not the exception, while less hoist, more gaff, long topmasts, loose mainsails are too general to excite comment. The actual practice of yachtsmen of all opinions has thus finally decided all the main questions at issue in favor of FOREST AND STREAM, and the work of this season is to decide the minor details, keel or board, moderate or small beam, the proportion of draft best suited to our requirements, and various points of less importance.

While a large number of yachtsmen still sail under the flag of the thorough cutter, most of those who once stood up stoutly for the old light displacement boats have abandoned them and shifted their colors to a new type of craft, deep, wide, large displacement, mixed rig, centerboard, low weights; a type represented in Boston by the new Thetis, and in New York by Athlon, who has sailed her first races within the last two weeks, while a large contingent, still further over the fence, have pinned their faith on the cutter Isis, a boat moderately wide and deep.

The presence of so many cutters, and of the two latter boats in addition to most of the older sloops, and the Thistle, new in these waters and just rebuilt, had raised anticipations of fine sport, which have been to a certain extent realized, though marred by those accidents incident in yachting, and of which the cutters have had their full share.

Bedouin, of whom so much was expected, has been out of all the races, owing to the death of a child of her owner; Ileen has changed skippers but recently, and her new master, promoted from a ten-tonner, has not had time yet to learn his boat, while in Friday's race, being a resailing of the previous day's contest, and not on the programme, she had no regular racing crew aboard. Wenonah has been equally unlucky, losing topmast on Thursday and parting her shrouds on Friday, so that the whole burden of the fight has fallen on little Oriva, a task she has accomplished in a way creditable to herself and her owner. Of the sloops, the only mishap of moment was to Mischief, who varied her usual performance by starting her port chainplates in the jump off the Hook on Friday.

The paltry winds of the first two days made any real test impossible, while the postponement of the New York race, with Monday's contest so close, prevented several from entering it, and cut down the S. C. Y. C.'s entries on Saturday. The Atlantic Y. C. race was, of course, of less interest than the others, the boats being centerboards, with one exception, the entries for large schooners small, and there was little wind. Mischief and Fanny did the best work of the day, being about even throughout, Gracie was hardly in the race at any time, and Athlon showed up once or twice, noticeably when near home, and Grayling beat her two competitors, no great task.

The light wind of Thursday, shifting as it did, with numberless flukes and no race at the end, gave no test of merit, but some of the individual performances may be noticed in passing. Ileen at the start showed what she could do in a drift, and promised well until her chances were spoiled by a shift of wind. Athlon followed her for a time, and though making no hug off Fanita in their beat down outside, made a better show in the evening when chasing the leaders in a light breeze. Mischief and Fanny did about as on Tuesday. Wenonah footed well but went out of her course before turning the Lightship and lost her topmast afterward, her sailing when there was a chance justifying her old reputation. Oriva and Vixen were about even all day; Gracie was astern again, and Isis did nothing of note, though of course allowance must be made for a boat in a race that was virtually a trial trip. Of the schooners, Grayling did the best, Montauk not having wind to move her.

Friday's race, with its wind and sea, sifted out the entries with a rude hand. Wenonah, Mischief and Clio disabled, Athlon and Isis turning back in the face of the beat out, and of those who went over, Ileen, showing what she could do to windward, pointing, footing and going easily through all, beating Gracie and Fanny easily to the Lightship, leading them to the Southwest Spit, only losing her place after a splendid struggle on the final run home; while Oriva took good care of Vixen all day, finally beating her home.

Saturday's work under similar conditions was the same, but even more so. Vixen did not start. Athlon and Isis looked around the Hook and came home. Gracie went over the course, led for a greater part of the way by little Oriva, while 28-ft Petrel hammered down to the Hook and home in grand style. Of the schooners, only the little keel Ray went over the course, Clytie, who started with her, turning back disabled, the rest not venturing out. Neither side can thus far claim a decisive victory, but certainly the laurels for the best, if not the only brilliant performance of the whole week, rest with Oriva.

AROUND LONG ISLAND.

AS the ability of American yachts to go further and risk more increases, the desire to do so will grow with it. While it is true that long and dangerous cruises have been made at times in shoal boats it is equally certain that off shore cruising is becoming more common than ever before in our yachting annals, and this year promises to surpass all previous ones in the matter of long races.

The first of the series, that around Long Island, was sailed this week, starting on Monday afternoon, fourteen yachts crossing the line. The prizes are a cup valued at $500 for schooners, presented by W. D. Travers, one of a like amount for first class sloops, presented by ex-Commodore J. D. Smith, and one of $3 0 for second class sloops presented by Mr. Archibald Rogers and Rear Com. S. R. Platt.

The race is a "go as you please," no time allowance and no limit to crews or course after rounding Romer Beacon. The starting line was between the forts in the Narrows, and the finish on a line from Execution Light to Sands Point Lighthouse.

At 4 o'clock on Monday the starters were ready about the line with the steam yachts Theresa and Vision, the catamaran Jessie, several sloops and schooners, and the Luckenbach, with a number of the New York Y. C. members, including Mr. Montant, who had charge of the start, on board. A preparatory whistle was blown at 3:55 P. M., and at 4:05 a second one to start.

The day was clear and warm, wind light from southwest, and water smooth away out, with an ebb tide. The yachts that started and their time of crossing were as follows:

Name.	Owner.	Start.
SCHOONERS.		
Montauk	Rear Commodore Platt	4 09 00
Grayling	L. A. Fish	4 06 50
Fortuna	Henry S. Hovey	4 07 55
Ruth	H. Hathaway	4 10 25
E-telle	J. D. Smith	4 09 20
Fleetwing	R. S. Elliot	3 13 03
FIRST CLASS SLOOPS.		
Fanny	Prince & Whitely	4 07 18
Gracie	Joseph P. Earle	4 11 03
Ileen	Arthur Padelford	4 07 50
Wenonah	James Stillman	4 06 50
Hildegarde	Herman Oelrichs	4 09 25
SECOND CLASS SLOOPS.		
Athlon	J. G. Barron, M. D.	4 11 00
Vixen	F. O. Lawrence, Jr.	4 03 40
Oriva	C. Smith Lee	4 06 15

Most of the sloops and cutters had club topsails set, the schooners under full sail, Ileen ran up balloon jibtopsail before crossing. Fleetwing made a specially fine show with kites set, Oriva crossed first with her old antagonist, Vixen, right on her heels.

At 4:30 Fanny was ahead, Grayling close after her, Vixen, with Oriva fast on her weather quarter, Hildegarde just under Oriva's lee, with Wenonah astern of the two, and Ileen astern but to windward of all four. Behind this group was Fortuna, with Athlon astern of her again, Gracie being among the stragglers.

Soon Oriva and Vixen had a little bout of their own to windward, Oriva twice luffing up, while the two other twins, Ileen and Hildegarde were evidently happy in each other's company. At 4:42 Hildegarde went through Ileen's lee; at 4:45 a spinaker boom came out on Fanny's port, ready for the turn at lower beacon, others following at once.

Fanny passed the Romer at 4:50, the others being timed as follows:

Grayling	4 51 00	Oriva	4 57 00
Hildegarde	4 52 20	Athlon	4 57 30
Fortuna	4 55 00	Ruth	4 57 40
Montauk	4 55 30	Gracie	4 59 00
Wenonah	4 56 00	Fleetwing	4 59 30
Vixen	4 56 10	Estelle	5 00 00
Ileen	4 56 30		

When off Coney Island at 5:23, Oriva parted her spinnaker halliards and down came the big sail in the water, just as she was leaving Vixen. A hand was soon aloft repairing damages, and at 5:35 up went the sail again. As the twilight deepened they stood on in about the same order until lost to sight to those on the tug, and the race was fairly begun.

On Tuesday evening, Commodore Munroe, of the Larchmont Y. C., with the Regatta Committee and a party of the club members, put off in a tug, lying all night on the finishing line at Execution, but nothing was seen of the yachts, the race being almost a dead calm. The schooners Nokomis, Meteor, Tidal Wave and Columbia, with Estelle and Bedouin, were awaiting the finish off Larchmont.

At 9 A. M. the leaders were reported off Mattinecock Light, and later Fanny appeared first, crossing the line at 11:42 with Grayling just astern. Gracie arrived at 12:07 and Montauk at 1 P. M.

WHISPER.—This steam yacht has not had her pressure cut down as reported, being allowed 150 pounds, the boiler having stood a test of 225 pounds. Her owner, Mr. P. S. Ramey, has made a number of valuable experiments with wheels during the past year, both on her and with small models, and she now has a wheel of his own design with two thin steel blades bolted to a cast iron hub.

MADGE.—After two years of idleness Madge turned up in the Bay last week. She must have been astonished at the change two years had made in the fleet, double head sails, plumb stems, longer overhangs, tall topmasts on every hand, a result for which she may take a large part of the credit.

INDIAN RIVER Y. C.—A yacht club was organized June 7, known as the Indian River Y. C., of Rockledge, Fla. The officers elected are: Gardner S. Hurdee, Commodore; Lyman Barnes, Vice-Commodore; H. S. Williams, Captain; B. C. Willard, Treasurer; Barton Smith, Secretary.

THE SNYDER ENGINES AND YACHTS.—The steam yacht has now passed from the first stages of experiment and become an accomplished fact, taking its place no longer as an article of luxury for a few, but a necessity wherever water transit is needed, filling a position between the towing and sailing boats and larger steamboats. To meet the increasing demand, the Snyder Engine Company are now building a line of engines and boilers especially designed for steam yachts, tugs and launches, besides which they also furnish the hull completely fitted up for use. For the smallest boats they build an engine 2¾×4½, 24in. high, and of but 50 pounds weight, with a boiler of 24in. diameter and 42in. high, from which they run up to a 12×12 cylinder with boiler in proportion. The small sizes are of very neat design, fitted with link and reversing lever, the parts being carefully proportioned and all neatly finished. The boilers are of iron or steel, vertical tubular in type, and are specially designed to be easily cleaned and to do the best possible work with poor waters as is often necessary in steam yachts. The company make a specialty of one size of yacht that has been found to meet the popular demand best, the hull being 30ft.×6ft. 6in. with 20in. draft. The engine is a 3¾×5½, with boiler 23×48, vertical tubular, wheel 24in. The hull is of oak, planked with cedar, and finished either with awnings or light roof as desired. Besides the above, the company also manufacture propeller wheels, and a large line of portable and stationary engines, both vertical and horizontal.

ANOTHER STEAM YACHT DISASTER.—Following close on the sinking of the Stella comes the foundering of the Gazelle, a boat once known in New York, but since used in Florida and later in Baltimore. The Gazelle, 56ft. long, 18ft. beam, and 4½ft. depth of hold, started out from Baltimore on Tuesday afternoon, June 10, having besides her captain, J. R. Mills, and a crew of five, a party of seventeen ladies and sixteen gentleman, members of the Tuesday Club, besides a German band, all bound on an afternoon excursion to Annapolis. They spent some time ashore and started at 9 P. M. to run up, but once out of the Severn River a gale was met from southeast, kicking up a sea that soon had the little craft leaking badly and the situation became quite dangerous. Soon many of the party, though ignorant of their danger, became very seasick. Several of the gentlemen, together with the captain, decided on making for a dredge known to be anchored off the Patapsco River, but on reaching it the sea ran so high that it was almost impossible to come alongside. After great difficulty, however, the ladies were safely landed on the dredge, in spite of the musicians, who insisted on landing first, but were knocked down by some of the gentlemen. It was found that the yacht was sinking, so all abandoned her, taking refuge on the scow, and shortly after she disappeared. The ladies were housed in the engine room, while the others had to pass the night on deck in the rain, all being finally taken to the city by a tug the following morning.

THE PENNSYLVANIA Y. C. held its fourth annual regatta on the Delaware, on Monday, June 9. The course was from the Kensington Water Works wharf to a buoy opposite Delanco, N. J., and return to a buoy opposite place of starting. Fifteen boats started. The signal was given at 11 o'clock exactly. On arrival at Delanco the little fleet met with quite a squall, but no accident occurred. Good sailing was made the whole way. The crews were favored with glorious weather and light, breezy winds. Considerable amusement was caused by the efforts of one crew to cut out another's boat. The order of passing the home buoy was: First, No. 7, Bessie; owner, J. Leslie Wood; sailed by George Smith; second, No. 5, Joe and Willie Smith; owner, J. Leslie Wood; sailed by John Smith; third, Leonard Stadler, disqualified; fourth, No. 13, Mediator; owner, Walter Gildert; sailed by John Armroyd. The rest came in straggling. The first prize was $20 and the champion flag; second, $12; third, $6. The winner arrived at the home buoy at 4:15 P. M. exactly.—*Philadelphia Times.*

PROPOSED FLORIDA CRUISE.—Cleveland, O., June 9.—J. W. Rusk, principal of the Rusk School of Elocution, and wife are preparing for a trip to Florida in a small yacht. They will ship the yacht via C. P. R. R. to Wellsville, O., thence down the Ohio to the Mississippi, down to the gulf and around the coast to Florida. They expect to be absent about seven months, leaving Cleveland about Aug. 15. The yacht will be fitted out for comfort and staunchness rather than speed. It is 24ft. by 8ft. beam, cabin 12ft. They will use a Stranahan canvas boat for tender.—PEDAGOG.

A FRENCH YACHT COMING.—Paris, June 6.—*Editor Forest and Stream:* The following bit of news may be of interest to some of your readers: The Nautienne, 700 ton yacht, leaves Havre, June 10, for Quebec, Montreal and New York. She will be the first French yacht that has ever crossed the Atlantic. There will be on board M. E. Blanc, her owner; M. B. Clerc, proprietor of *Le Yacht* newspaper; M. Bonade, the well-known owner of the 40-ton racer Ayosoils, and M. Paul Saunière.—B. C.

CAPE MAY RACE.—But two entries have as yet been made for the race around Cape May Lightship on Monday next, Montauk and Grayling. The condition of the race, which is open to all yachts belonging to any yacht club, are that it is to be sailed in cruising trim, with boats at the davits and anchors on bows. As it is without time allowance, it is not likely that the sloops and cutters will enter.

BOSTON Y. C.—The annual review of the Boston Y. C. was held on Saturday, June 14, in Dorchester Bay, the Adrienne, Commodore Pfaff's flagship, taking her position off Thompson's Island at 3 P. M. and firing a signal gun. The fleet passed in review with a fresh southeast breeze, each firing a gun to leeward in passing, the smaller ones dipping their colors. After a sail down the Bay all spent the evening at the club house.

NEWARK BAY Y. C.—The winners in the various classes in the open matches of Monday were: Vixen, 1:38:34; Our Own, 1:30:20½; Just Woke Up, 1:32:50½; Cygnet, 1:35:31; Shadow, 1:32:28, and Teaser, 1:35:11. We will give a fuller account next week.

EAST RIVER Y. C.—But one boat, the Nettie Thorp, capsized on Monday in the races of the East River Y. C. The course was from the club house to and around the Gangway Buoy and back, the H. H. Holmes winning, with Snoozer second.

DAISY.—This cutter, lately purchased by Mr. Maunsell Van Rensselaer, Jr., of this city, was sailed around from Southampton, England, to Liverpool, and will leave on Saturday next for this country on one of the ocean steamers.

THETIS.—The new one of which so much is expected, was out on Saturday last, on Boston Bay. It is a pity that she was not ready for the Long Island race, but she will make her first appearance at Marblehead soon.

NEW HAVEN Y. C.—Great preparations are being made for the races of the New Haven Y. C. on Monday next. The club now has 33 yachts, 30 being sailing craft, nearly all of which are entered.

SOUTHWARK Y. C.—The winners in Monday's races of this club were: Class 1, Maud; Class 2, Morgan; Class 3, Charles Benton; Class 4, Amanda C.

IOLA.—Mr. Oswald Jackson's sloop came out last week with jib and staysail in place of the single jib she has carried heretofore.

A FIRE is a good servant but a poor master. A pen is also a good servant, but to be master of it use Esterbrook's.—*Adv.*

A WOMAN'S OPINION WORTH HAVING.—Willimantic, Conn.—*Editor Forest and Stream:* Permit me to express my admiration for the publication of a sportsman's paper so pure that the most sensitive and refined lady can read every line without a blush. Many of us can get our outings only through the stories told by our husbands or brothers, and believe me we appreciate the jokes a great deal better if told in the manly, straightforward way in which your "boys" tell them. It does not require very deep penetration to distinguish the sportsman from the sporting man, the sportman's paper from the sporting papers that occasionally find their way into our homes.—A SINCERE ADMIRER.

THE GREAT DESIDERATUM.—Of late years a new enemy of the health and happiness of the people has appeared in the form of malaria. Not that the thing of itself is new, but the name has a newer definition—so wide that thousands of our people in city and country believe themselves afflicted with it. So physicians tell us, and perhaps they are right. All those bad feelings, depression of spirits, coated tongue, capricious or wanting appetite, pain in the head, back or limbs, we are told, are all due to malaria. And to cure malaria the doctors prescribe quinine, and the people take quinine, in season and out of season, the high and the low, the weak and the sick and the well, until everybody is rolling the bitter morsel under their tongues. Well, does it cure? No. Is it harmless? No, for it does produce neuralgia and deafness and other disorders, sometimes of very grave character. Is there no better way of treating malaria than this abuse of this most powerful and even dangerous medicine? Yes, there is; and it is a fact proved by twenty years' use and experience, and thousands of triumphant cures that Humphrey's Homeopathic Specifics Nos. 10 and 16 do cure, promptly and permanently, all those cases of malaria, and that with simple, tasteless, harmless, sugar-coated pills.—*Exchange.*—*Adv.*

OUR READERS will confer a favor by sending us the names of such of their friends as are not now among the subscribers of the FOREST AND STREAM, *but who would presumably be interested in the paper.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, JUNE 26, 1884.

VOL. XXII.—No. 22. NOS. 39 & 40 PARK ROW, NEW YORK.

CORRESPONDENCE.

THE FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. Communications upon the subjects to which its pages are devoted are respectfully invited. Anonymous communications will not be regarded. No name will be published except with writer's consent. The Editors are not responsible for the views of correspondents.

SUBSCRIPTIONS

May begin at any time. Subscription price, $4 per year; $2 for six months; to a club of three annual subscribers, three copies for $10; five copies for $16. Remit by registered letter, money-order, or draft, payable to the Forest and Stream Publishing Company. The paper may be obtained of newsdealers throughout the United States, Canadas and Great Britain. American newsdealers should order through the American News Company, those in England, Scotland and Ireland, through Messrs. Macfarlane and Co., 40 Charing Cross, London, England.

ADVERTISEMENTS.

Only advertisements of an approved character inserted. Inside pages, nonpareil type, 25 cents per line. Special rates for three, six and twelve months. Reading notices $1.00 per line. Eight words to the line, twelve lines to one inch. Advertisements should be sent in by the Saturday previous to issue in which they are to be inserted.

Transient advertisements must invariably be accompanied by the money or they will not be inserted.

Address all communications,

Forest and Stream Publishing Co.

PUBLISHERS' DEPARTMENT

A PUBLIC ENEMY.

HE is more commonly known as the dog-catcher, and is found only in the larger towns and cities. Here in New York he travels about with a wagon, in which is a large cage to contain the prey, and an assistant. There was once a dog-catcher who was honest, but he died many years ago and left no descendants. The present race consists, for the most part, of political heelers of the lowest grade—what we call here "toughs" or "short-hairs." They receive their positions through political influence. These men are appointed in accordance with a city ordinance, which requires that all dogs shall be licensed, and shall have attached to their collars a tag bearing their license number. If allowed to run at large, such dogs must wear, in addition to the license number, a muzzle, "constructed so as to prevent the dog from biting." If without a muzzle, the dog must be led "by a cord, rope, or chain, not more than four feet in length." Dogs whose owners do not comply with the provisions of this ordinance are to be captured by the dog-catchers and destroyed.

From what we know of the life of a city dog-catcher before he comes to occupy this exalted position, we should expect that he would prove to be neither more nor less than a licensed dog thief. This is just what he is. Each dog-catcher receives from the city forty cents apiece for the dogs which he captures, and to earn this sum these men stop at nothing. Last year one of them killed a boy in a dispute over the latter's dog, and it is an every-day occurrence for them to catch dogs which have been licensed and muzzled, according to the ordinance, and after having removed the collar and muzzle, to drive away with the victim to the dog pound. Frequently they will snatch from its mistress's arms a valuable pet dog, or will seize it as it runs at the end of a chain, and, cutting the collar, will walk away with the prize. Such an act differs in no respect from snatching the purse, except that the one who steals the property is a licensed official of the city.

The ordinance forbidding dogs to be allowed to run at large is one which has much to recommend it, and it is a desirable thing that the homeless and useless curs, which are only less of a nuisance than the city cats, should be got rid of. But after the owner of the dog has complied with all the requirements of the law, it is an outrage that his property should still be exposed to the attacks of these legalized robbers.

A few days since a gentleman, not a resident of the city, had occasion to bring his dog into town, and to lead him along the street for a few blocks. He had gone but a short distance when he was set upon by one or two dog-catchers, who ordered him to give up the dog. The gentleman in question, having his dog on chain, and feeling sure that for a non-resident no license was required, declined to yield up his property at the fellow's demand, and as there happened to be a policeman among the throng attracted by the dispute, the owner of the dog appealed to that officer for protection. The policeman, however, said that he could do nothing, but as a matter of private advice he recommended the owner to "bat" the dog-catcher. Having therefore found a good-natured and trustworthy bystander to hold the dog, the owner proceeded vigorously to "bat" the dog-catcher, and in a short time administered to him a severe thrashing, after which, amid the plaudits of policeman and street boys, he led away the prize of victory.

The gentleman to whom all this happened was clearly in the right, for the ordinance says "the provisions of this section [*i. e.* as to procuring a license], except those relating to leading and muzzling dogs, shall not apply to dogs owned by non-residents, in remaining temporarily or in passing through this city, or to dogs brought into this city and entered for exhibition at any dog show or annual exhibition of dogs."

The moral of all this is that so long as matters in this city remain as they now are, a man is justified in using force to protect his property, and that when he does stand up for his rights in this way, public opinion and the officers of the law will uphold him in it.

USE FOR THE BARE-FOOT.

THE bare-footed boy is occasionally employed by the angler and gunner to direct them to the choice trout pools and game covers; or to give desired weight to the basket and rotundity to the bag. This is a high and honorable service; and many a sportsman has in his soul a soft spot for the memory of the small boy who saved him from the chagrin of coming home empty-handed.

There is another field of usefulness, to which the talents of our stub-toed young friend might be most profitably directed. Why not induce the small boy to play detective? He is admirably adapted to the work. There are bare-footed boys and bare-footed boys. The one usually encountered in the field is sly, shrewd, circumspect and cunning. He has a sharp eye, knows a thing or two, and can draw his own conclusions. In short, he is just the material to convert into an amateur detective. He delights to catch a fish and sell it for ten cents. He might be taught to take pleasure in catching law-breaking anglers, and receiving pay in proportion.

Some of our game-protecting officials are making complaint that they cannot detect the fellows who infringe the game laws, because the miscreants know the wardens, and elude their efforts. But no one would suspect the small boy. The most wary rascal who pursues the untimely search for fish, and the most artful dodger who sneaks for June woodcock, would entertain no suspicion of the bare-footed, ragged-shirted, one-gallused, brown-faced boy. The probabilities are that he would tell the youth all about it. And the youth could tell the justice.

It may be argued, with some show of reason, that this proposal to use the boy as a detective is foolish, because in every well-regulated instance of the sportsman and the bare-footed boy, it is the latter who catches the fish or snares the bird and sells them to the former. This is not an insuperable objection. Now and then a small boy might be found of so guileless a nature that he would not only sell the man the contraband spoils at the best bargain he could drive, but would add to his emolument by afterward swearing with unblushing front that the man captured the fish himself, and he saw him do it. And the fisherman would not deny it.

It is customary with regiments of troops to adopt a "Child of the Regiment." This might be imitated by game protective clubs, adopting a "Bare-footed Boy of the Club." By taking the youth in hand at an early age and teaching him that to kill a bird out of season is a more heinous offense than to slay a human being at any season, and that to destroy the trout before their time is immeasurably more wicked than arson, his ardor in the good cause might be kindled to such an intensity that, unaided and alone, the youngster would do as much for the cause of game protection, as is accomplished in the same direction by the monthly dinners of the club.

PRAIRIE FIRES AND PRAIRIE CHICKENS.

IN SOME parts of the West, the farmers fire their lands in the spring to insure an abundant crop of hay. They burn the ground as late in the season as possible, in order that the growth may be put back and the crop mature late. In this way they can put off their haying until after the wheat crop has been gathered. Just here comes a clashing of interest between farmer and sportsman. This late burning of the prairies causes the destruction of the pinnated grouse eggs; for the birds are nesting when the late fires are set. The shooters claim that in this way more grouse are destroyed every year than fall to the gun. In some localities this is doubtless true. It is also claimed by the gunners that the farmers can just as well burn their lands earlier in the season, before the birds have nested. And in one or two instances the sportsmen have practically demonstrated their theory by actually firing the farmers' lands. The burning was entirely successful, but in view of the damages awarded to the land-owners, the experiment will probably not be repeated.

So far as our observation of the state of affairs has extended, there is no way in which this conflict of interests can be reconciled. The "chicken crop" should be fostered by every means possible, but it is not so important as the hay crop. Much as the destruction of the birds by fire is to be regretted, the farmer can hardly be expected to sacrifice his hay to save the chickens.

OUTERS AND SHUT-INS.

CLUBS, whose members join together to take their vacations in company, are a familiar feature of our social life. The number of such clubs has wonderfully increased since we began to publish a paper in their interest and in the interest of individuals who take their outings alone. With the ways and doings of the vast throng of out-door pleasure seekers we are all pretty well familiar. Week after week we have read of their explorations, adventures, trials, joys and disappointments. The grand army of outers is doubling its hosts. The veterans of the corps are looking with ever-growing jealousy upon the new recruits crowding into the old camping grounds, and, like the frontiersman, they are seeking new wildernesses, whither they may move on to fish and hunt unmolested.

There is one association which is very different from these bands of outers. Its exploits have never been told very fully in print, but like the shooting and fishing and camping and tramping clubs, its membership is all the time growing. This is "The Shut-in Society." Its membership is made up of invalids who are shut in from the outside world. The clubs of outers are joined together by their taste for out-door life and pleasure; the Shut-ins are united by one sufferer's sympathy for another. The outers join to seek sunshine and balsam odors. The Shut-ins, while of necessity they cannot meet each other, are united to give one to the other consolation which may cheer—as by sunlight—the darkened chambers in which they are immured.

The Shut-in Society was started in 1877, by an invalid lady of New Vernon, N. J., who, having been an invalid for several years, sought to give and receive comfort by correspondence with some one who was, like herself, "shut in." One and another was added, and in time a society was organized. It now numbers nearly two thousand members.

The society publishes a monthly journal called the *Shut-In Visitor*, which is edited by Mrs. Kate Sumner Burr, Walworth, N. Y. The monthly arrival of the *Visitor* is, we may be sure, looked for with more eagerness than that with which the outers await the coming of their journal.

It would be difficult to name societies in more pathetic contrast than those of the outers and the Shut-ins.

WOODCOCK WORK.—The committee to receive money for a Long Island game detective fund acknowledge the receipt of $50, and more is expected. With this encouragement the game protector of that district ought to secure such assistance as will make sure the capture of the shooters who have openly stated their intention of shooting woodcock on Long Island next week. The open season for woodcock will not begin anywhere in New York State before Aug. 1.

The Sportsman Tourist.

UNCLE LISHA'S SHOP.

IV.

THE first snowfall of the season in the little valley was sifting down from a dull sky one November evening not long after that just told of, when Lisha's friends began to gather in his little shop. Each one, as he entered and stamped the snow off his boots, made some remark concerning this latest turn of the weather, as in duty bound by ancient usage: "Snowin'," "Snowin' c'nsid'able kind o' smart," "Gittin' some snow at last," said one and another, and one ventured to "Guess 't we're goin' to git some sleighin' fur Thanksgivin' arter all."

"Wal, I d' know 'baout that," said the oracular Solon Briggs, seating himself in the best place behind the stove, with his elbows on his knees and his hands spread to catch the heat, "I knowed 'at 't was goin' to snow, an' said t' was, an' it does snow, baut I took a notice every sen' I commenced my pilligridge (i wou' say, my pilgigrim) that when the snow comes on ter the graound when it's conjoled, that is, when it's froze, it hain't a goin' t' stay on an' *en*-dure long. Why it is I do' know, but so it is as fur as my observations has went."

Houh!" snorted Lisha, who was rummaging a shelf for a desired last, "Mebby so, but I guess—No. 12, that's it—I guess 't we'll hev sleighin' fur Thanksgivin'. But dum the sleighin', I wish 't I hed a turkey fer Thanksgivin' 's big 's what my boy 't live in the 'Hio tells o' hevin' there, wild ones. tew, 't weighs thirty, forty paound! What ye think o' that?"

"I daoubt it," was Sam Lovel's laconic response, and there was a stir of approval in the audience.

"Daoubt it!" shouted Lisha, "Good airth an' seas! My boy wouldn't lie an aounce on the weight of a elephant. Thirty 'n' forty paound, that's what he writ."

"Wal, I daoubt it," Sam repeated, "jes' think on 't, that's mos' half as much as Cap'n Power's hog weighed, 'n' he was a sollaker, ye know. Turkeys ain't in the habit o' growin' so big."

"Not here, I know they hain't," Lisha admitted.

"No," Solon interrupted," fer it hain't their nart'ral climax. They hain't abregoines here."*

"No," Lisha continued, "'n' then things grows bigger there 'n what they does here. Why, the corn grows so high 't they have to climb up a ladder to bind the stooks, 'n' my boy writ 't the punkins grow'd so big in the 'Hio that a six-foot man stan'in' stret up couldn't tech the top on 'em! What ye think o' that?"

"O shaw! Git aout! Go to grass!" were the comments on this statement.

"Yes, boys, it's sartinly so," Lisha persisted, with the twinkle of his eyes showing through his dim glasses. "I didn't scacely b'lieve it myself, 'n' I sot down 'n' writ George a letter 'n ast him ef that was r'aly so, an' he writ back it sartinly was. A six-foot man couldn't tech the top o' one on 'em—not 'thaout stoopin' jest a lee-tle. Haw! Haw! Haw! Ho!"

"Oh, aw," said Solon. "Yes, George writ ironical, in sportyve jest, as it ware."

"Wal," said Lisha when he had done laughing, and had got the last inside of a great boot that needed tapping, "Le's p'cede to business, 's they say in the leegislatur. We was talkin' 'baout aowls t' other night, wa'n't we? Solon he tole what made 'em hoot, 'n' Jozeff he tole 'baout shootin' one. Hain't ye got nothin' furder concernin' the faowl, Jozeff?"

"I d' know," Joseph Hill responded. "Lemme see. Didn't none on ye never hear how Zene Burnham come it on his father?"

If any one had heard it he made no sign, and Joseph proceeded with his tale.

"Yes, sir, his own father! O, what a darned crutter he was! Ye know the' hain't no spring nigh the ole man's, so they've got a well; puty good water, tew, that is, for water, with a reg'lar ole-fashion sweep—do' know though, mebby they've got in a pump naow. Lemme see, didn't Morrison sell 'm a pump? Seem t' me 't he did. Wal, 't do' make no diffunce, they hed a well sweep, then. One night in the fall—I guess 'twas; yes, know 'twas well 'nough, for fall's the aowliest time o' year—Zene he come tippytoein' int' the haouse 'n' spoke low t' the ole man, an' sez he, 'Father, the's the all-tummuttablest gret hoot aowl a-settin' on the top o' the well sweep! Git the gun an' shoot 'im. You c'n shoot better 'n I can in the dark.' The ole man kinder thought Zene was a-foolin' on 'im, but Zene said for 'im to go an' see for hisself; so the ole man got the gun 'n' 'twas loaded for fox, an' stuck a piece o' white paper ont' the sight, an' crep' aout the back door 'n' raound t' the nawwest corner o' the haouse—lemme see; no, 'twas the naweast—no twa'n't nuther, 't was the nawwest corner—an' peeked raound, 'n' there he seen the aowl, an ole whopper, settin' up there, jes' as demute! An' he drawed up an' took dead aim, he did, 'n' onhitched, 'n' the aowl never stirred! 'Wal, I'll be dummed to dumnation,' sez he, 'What 'n' thunderation 's the motter I didn't kill 'im? You ben drawin' the shot aouten this gun, Zene?' 'Hain't teched the darned ole gun,' sez Zene. 'Yew hit 'im in the head an' stunted 'im; load up an' give 'im 'nuther dost,' sez he. So they went back in an' loaded up agin, an' the ole man crep' aout agin, 'n' there sot the aowl yit, an' the ole man blazed away agin, 'n' by gosh! the aowl never stirred agin! Then the ole man he swore it beat the devil, if twa'n't the devil hisself, but Zene tole him 't he knowed he'd killed him. 'Pull daown the sweep,' sez he, ' 'n' git him. He's sartinly deader 'n hay.' So the ole man sot daown the gun an' begin te pull daown the sweep jes' as keerful, a watchin' the aowl all the time as he come daown, never makin' a motion. When he git him clus to an' was jest agoin' to take a holt on 'im, he seen 't wa'n't nothin' but a all-fired gret big cabbage tied on t' the end of the sweep! My! 't the ole man wa'n't mad! Zene he put er for in t' the haouse 'n' up stairs 'n' int' bed, 'n' by mornin' the ole man hed got good natur'd agin, but ye didn't want to say 'aowl' to him right off."

"Did he hit the cabbage?" was asked by him of an inquiring turn of mind.

"Those 'ere saw-whet aowls," Solon Briggs remarked, clearing his throat, "is a curosity thing—a frik o' natur' comin' daown to her onsignificantest teches—a nart'ral fewnonnymon, so to speak. A puffick aowl, mimus the gretness of the die-mentionest kinds."

"Wal, they be small, but reg'lar aowls," said Sam Lovel, "Cut the head off 'm one 'n' he 'll lack a aounce o' weighin', I shot one on 'em outen a tree jes' to see what he was 'n' he come a floatin' daown julluk a bunch o' feathers."

"An' their vocal voice," put in Solon, "is the fact smile of sharpnin' a saw."

"Guess 't is," said Sam, "egg-zack! Makes me think o' one time 't ole Mist' Van Brunt f'm New York, 's up here a lookin' arter his lumbrin intrus. 'T was long airly 'n the spring 'n' he was ridin' 'long hoss back 'n the evenin', 'n' when he got daown int' Stunny Brook holler, he hearn somebuddy a filin' a sawmill saw, screet er screet, er screet er, 'Some o' them damn maounting Aribs,' sez he, 'hes got a sawmill right here in the hairt o' my woods! Hello you!' he hollered, but the file kep' a goin', screet er screet, er screet! 'You owdacious villing!' sez he, he allus used high duck langwidge, 'You owdacious villing! I'll prosecute ye to the extents o' the law,' sez he, and he rid his hoss int' the woods where he hearn the noise, 'n' his sto'pipe hat ketched on a limb an' tumbled off, 'n his hoss stumbled agin a ruht 'n' throwed him off 'n' then the noise o' filin' stopped, n' then in two, three minutes it begin agin furder off. 'The pirutical scoundril,' sez the ole gentleman, 'hez got his damn sawmill on wheels!' 'n' he got back int' the path an' rid ont' the tarvern 'thaout no hat. When he got there he tole Hamlin (he kep' it then) what he'd hearn, 'n' Hamlin he laughed 'n' sez he, 'Mist' Van Brunt, 't wa'n't nothin' but a saw-whet 't you hearn.' 'A saw-whet!' sez th' old gentleman, 'I know it, but a two-legged saw-whet, sir.' 'Yes,' sez Hamlin, 'two-legged, but he wears feathers stiddy close,' 'n' 'xplained. Then the ole gentleman laughed at hisself, an' treated the hull craowd, a dozen on 'em, to ole Jamaiky sperrits 't he brought with him f'm York—twenty ye'r ole, they said 't was."

"Gosh!" ejaculated Joseph Hill, with a watering mouth, "wish 't I'd a ben there!"

"Ben where?" asked he of the inquiring mind.

"The study of nart'ral hist'ry things," Solon remarked, "is a most stumenduous subjeck, cal'lated to fill the human mind of man with—er—er—ah—"

"Puddin' an' milk," shouted Lisha, as he drove the last peg in the wide sole of the boot, "'n' I 'tend to ha' some an' go to bed."

So saying he took off his battle-scarred apron, and his guests departed and went out of sight with silent footsteps in the dusky whiteness of the snowy night.

* Solon is supposed to have meant aborigines.

ACROSS THE CASCADE MOUNTAINS.

IN the month of June, 1879, the writer and a friend E., feeling that a jaunt of a week or two among the mountains would be both beneficial and enjoyable, concluded to ride through the Snoqualmie Pass, in the Cascade Mountains. Twelve o'clock of June 27 found us on the backs of our steeds, with blankets and grub, guns and fishing tackle, etc., stowed and lashed in various manners about our persons and on our horses. The pass lies almost due east of the city of Seattle, and the summit is about seventy miles distant from that place.

Our road, for the first fourteen miles, lay along the Duwamish River, which flows into the Sound about a mile from Seattle. Three hours' ride through the cool shades of the gigantic firs and cedars and over the green meadows of the settled bottoms, brought us to the little town of Renton, situated at the confluence of Black and Cedar rivers. These two streams are cool and clear, and uniting, flow about two miles when they are joined by White River, and with that stream form the Duwamish. They are model trout streams, swift and gravelly, just small enough to be waded in the summer months, and are filled with myriads of trout. Renton we had visited often on fishing excursions. It is a coal mining town. Although the memories of past triumphs with the pliant rod filled our brains, and the old familiar pools and riffles seemed to gurgle a musical invitation to us to tarry a while, and greet their inhabitants with the deceptive fly, we had "other fish to fry," our journey for the day was only half ended, and we bade farewell to Cedar River, and proceeded on our way.

Leaving the main road at this point, we took the cattle trail which runs through the pass. This road is used to bring over cattle for the Puget Sound market, from the fertile valleys of the Kittitass and Yakima, and presents a singular appearance. The surface, wherever the ground is at all soft, is cut into regular ridges about two feet from summit to summit, with depressions between all the way from six inches to two feet deep. This is caused by the droves of cattle walking over the trail, though I have never been able to understand why it should have this singular effect. A more monotonous way of traveling than riding over these ridges could not easily be imagined. In places they would stretch for a mile at a time, nearly as high as a horse could step. Otherwise our ride was pleasant enough. The road was shaded nearly the entire distance. Every half mile or so, as we rounded a bend in the road, our horses would be startled by the whir of a covey of grouse or pheasant, interrupted in their feeding or wallowing in the dust on the trail. The thought occurred to us that half grown pheasants, broiled, would be a toothsome addition to our bill of fare for supper, so coming to a particularly large covey, E. dismounted, and stepped into the brush, while I sat on a log and held the horses and smoked. In a few minutes I heard the bang, bang, of his gun, and almost immediately afterward two more reports, and he returned with five young pheasants. We tied these to our saddle horns and went on.

Jogging slowly along, over hills and through grassy hollows, between rows of firs and cedars, about sundown the green fields of the Squak Valley came in sight, and stimulated by the thoughts of supper and rest, we spurred up our horses and were soon at the residence of George T., one of the solid farmers of the valley. Our day's journey was ended, and we were twenty-eight miles from Seattle. This little valley is at the head of Squak Lake, and forms the bottom of a small stream which flows into that lake. It contains possibly three thousand acres of fine farming land, and is a veritable garden spot. It is nearly all settled, and the settlers occupy themselves cheifly with hop raising. A ton to the acre is the average yield for vines more than one year old

Arising betimes the next morning we jointed our rods, and rigging a cast each, stepped out to Squak Creek, which runs almost at the door through the meadow. An hour's fishing brought to our pockets (for we had no creels) twenty-seven fine trout, none less than eight inches in length, and the largest weighing two and one half pounds on my pocket scales. Hastily cleaning enough for breakfast, we returned to the house, and turning the fish over to the cook, took towels, and going down to a large pool in the stream, had a glorious bath, and on returning found our fish hot, brown and—but why say delicious?

We were to await the arrival of a friend, S., who was to accompany us. Now an unforeseen difficulty presented itself. E.'s horse, a great raw-boned creature, had been slightly lame during the last few miles of our ride the evening before, and this morning was dead lame, and manifestly unable to proceed further. This was a trial which it was difficult to meet with a philosophical spirit, and we were beginning to feel rather blue over our misfortune, when we were joined by our host, who upon hearing of our trouble sent one of the men out to the pasture, whence he soon returned with one of the finest little horses I ever saw. He soon changed hands, at the price of fifty dollars, and was christened Rex on the spot. The lame horse was left to be sent back to Seattle when he should recover. E. kept his new purchase for four years, and only disposed of him when obliged to do so. He turned out to be one of the best riding animals I ever saw, and thus was the old adage exemplified, "'Tis an ill wind that blows nobody any good."

Some desultory whipping the stream, varied by intervals of smoking on the grass in the bright sunshine, and enlivened by the occasional capture of an exceptionally large trout, brought noon, and within a few minutes of that time S. hove in sight. He was as anxious to rest as we were to start, so lying under the trees, while lunch was preparing, he enlivened us by the recital of an adventure which he had met with on the way out. Coming slowly along the road, he had met a good-sized black bear, which had at first seemed inclined to dispute his passage. He had no firearms, so, riding back on the trail a short distance, he gathered a handful of rocks and setting his horse into a gallop charged the bear and put him to inglorious flight. At 1:30 we started for Falls City, on the banks of the Snoqualmie River, seventeen miles distant. Traveling steadily along at an easy pace, over hills and spurs of the mountains, we reached that place at 6 o'clock, laden with some half dozen pheasants for supper. Falls City is not what the name would imply, as the falls are some six miles distant, and the city is wholly wanting. There were, at the time of our visit, about three houses there, one of which was occupied. The location, however, is pleasant.

The Snoqualmie River, a good-sized stream, flows by, and is joined by Raging River at this place. This stream is small and is easily waded. It is clear and cold, and one of the finest trout streams I ever saw. Coming from the snow-covered mountains, it is raised to a formidable river in the spring by the melting snows, and being so large at that time, it keeps the banks free from trees and brush, and affords many fine places for uninterrupted casts. The Snoqualmie River here is also clear, cold and swift, and is navigable for steamers to this point, except at extreme low water. We camped for the night on the bank of Raging River, and proceeded to make ourselves comfortable. S. went to the only house and returned with hay for the horses and went back afterward for grain, while E. and the writer busied themselves about camp. To get a fire started, cut some cedar boughs for a bed, joint a rod and take a dozen ten-inch trout for supper, was the work of a short time, and inside of an hour from the time we struck camp we were feasting on smoking coffee and trout, garnished with bacon. The night was cloudless, but a little cool, and our blankets were all required to keep us warm. But lulled by the rippling of the water and the music of the frogs, with now and then the hoot of an owl by way of chorus, I soon fell asleep, and was only awakened by the shrill notes of some little songsters in a bush near my head, announcing that another day had begun.

Coffee and pheasant was the bill of fare for breakfast, and by the time the sun had risen we were in the saddle and away. A short level stretch, and we reached the foot of a mighty hill, where we concluded to be merciful to our horses, and took to our feet. After two miles of climbing we were at the top, where a fine panorama of mountain and valley, river and forest awaited us. A short rest and on we went five miles further to Jerry B.'s place, at the lower end of Snoqualmie prairie. This prairie fills a level space between two ranges of hills, and is about eight miles long and three or four in width. The Snoqualmie River is formed in the prairie by the confluence of four forks coming down from different cañons, and a short distance below the foot of the prairie are the celebrated Snoqualmie Falls, which we intended to visit. Stopping at Jerry's house we left our horses and crossing the river in a canoe started for the falls. A brisk walk of a mile and a half brought us within hearing of the falling waters, and pushing through the dense thicket of brush, which is watered by the spray of the falls, we came out about fifty feet down the river from the falls, and about the same distance below the top, on the edge of the vast cauldron into which the waters plunge. From our standpoint we had a fine view. The sheer descent of the entire river is two hundred and eighty-five feet, and when one considers that the river is so large at this point as to be navigable for steamboats nearly to the falls, and is clear as crystal, he can readily imagine the effect, with the sun shining as it was that beautiful morning.

After we had seen and heard enough, we went back up the river, stunned by the noise, and awed by the wonderful display of power we had witnessed. On arriving at the house, we mounted, and after a pleasant ride of five miles through the prairie, arrived at Lucinda G.'s place, on the banks of one of the forks of the river. This lady is something of a local celebrity. She was born and raised in this county, and so far as I know has never been out of the county. She is slightly inclined to *embonpoint*, weighing over three hundred pounds; is about five feet three inches tall, and is withal as jolly and good-natured a lady as could be found in a year's journey. She has a herd of cows that she milks, and which she has trained to a remarkable degree. We witnessed their regular performance at milking time in the evening. She seats herself on a stool in a corner of the barnyard, and the cows, some half dozen in number, come in their regular turn, or as she may direct, calling them by name, to be milked. They seem almost to understand the English language, and obey her every order perfectly and immediately. We stayed here the rest of the day, and all night. In the stream we caught trout in abundance, and E. went on a short hunting expedition, returning with a good supply of grouse. For dessert at our evening meal we had salmon berries and cream. These berries look much like a raspberry, and grow wild in great abundance on all the streams flowing into the Sound. They are yellow and nearly twice as large as a raspberry, and are delicious.

Arising in the morning refreshed and invigorated by a good sleep in the pure mountain air, we set out after a substantial breakfast, and started for the summit, thirty miles distant. Our road now lay along the branch of the river that we had fished in the evening before, and took us into the mountains in earnest. The first five miles after leaving

the valley lay along the top of a steadily ascending ridge called the "Devil's Backbone." This weary ascent made, we met with the river again and crossed it. The road then crossed the river seventeen times in less than that number of miles, but has been remodeled since so as to cut off some fifteen of the crossings. Some of the fords were particularly trying, being deep and swift, with huge bolders sprinkling the bottom of the channel. Our road this day was all up hill and very muddy. In places the horses would sink to the saddle girths, and the day's work was a hard one. Riding was an impossibility, and we walked all the way, towing our horses at the end of a rope. We made only a brief stop for lunch, as we were anxious to get as near the summit as possible before night.

The monotony of the day was varied by nothing of interest. Though we were high up, we could see nothing on account of the tall timber surrounding us on every side. Bears' tracks were plenty, but we did not search for the makers of the tracks. Night coming on, we stopped at the last crossing of the river, five miles from the summit. There was no feed for our wearied animals save leaves, and after a hastily-prepared supper of coffee and bacon, we rolled up in our blankets and slept. Tired as we were, with the first glimpse of day we were up; a repetition of the supper of last evening for breakfast, and we were off. This last five miles to the summit was the hardest of all. The mud seemed to be bottomless and the hills interminable. At the summit we found about a mile of snow, from one to two feet deep. Just before reaching the summit we saw a large gray wolf prowling among the trees, but before we could get a shot at him he had disappeared. There are still a large number of these animals in these mountains, but they are difficult to find, owing to their great cowardice. Arriving at the summit, we took a short rest and a smoke in honor of the event. We were then at an elevation of about 3,500 feet, in the heart of the mountains, with bristling snow-covered peaks all around us.

Starting on the down grade we went a couple of miles, when the road changed as if by magic. On the west side of the summit we had traveled through endless forests of fir and cedar, and the underbrush had been almost impenetrable. Now the scene changed. We were still in the midst of the peaks, but the timber had changed to pine, and the underbrush had disappeared, and in its place was the nutritive bunch grass growing luxuriantly. The mud had disappeared, too, and the road became almost dusty. This change was caused by our reaching the other side of the summit. The warm, humid currents of air, fresh from the Japan Current, which washes the shores of Washington Territory, are laden with moisture, and striking the mountains on the western side, cause an almost tropical growth of vegetation. On the other side, not reached by this damp air, the climate is totally different. It is dry and hot, and as a matter of course, the vegetable growth is modified.

We halted at the first stream we came to, and unsaddling our horses picketed them out, and allowed them to eat their fill. We also attended to our own wants in that line, and after noon started once more, feeling like new men with new animals. Lake Kichelass was to be our stopping place for the night, and following our road through pine groves and beautiful little grassy glades, on a continuous down grade, we were soon at the lake. This region is the paradise of the still-hunter. The vistas under and between the scattered pines give uninterrupted views for hundreds of yards, and the grass affords a fine feeding ground for deer. On the way down to the lake we saw a fine doe and fawn, and could easily have killed them both, but could not have used them, nor carried them out, so we refrained from shooting them, and with feelings of regret mixed with pleasure, that we had been sportsmen enough to resist the temptation, we watched the beautiful creatures as they bounded away. To the grouse we were not so merciful, and a few reports from E.'s breech-loader were enough to insure us a good supper.

Arriving at the lake, we found it was a veritable mountain jewel. It was about four miles long and two wide, and its setting was of snowy peaks on every side. This lake is the reputed home of trout of wonderful size, some of which are said to weigh a sufficient number of pounds to make the famous Rangeley trout ashamed of themselves. We had no means of verifying the stories we had heard, as they can only be caught with a spoon hook by trolling, and we had neither spoon nor canoe. A fly failed to raise them, but in the Yakima River, which has its source in this lake, and which is here a small stream, we found all we wanted, and after picketing our horses and taking a short rest, we jointed our rods and filled the air for the rest of the afternoon with the merry click of the reel. Our count at evening gave us about two hundred, with a three-pound "whopper" to E.'s credit, taken on a royal coachman. Our most killing flies in this portion of the Territory are about as follows: Coachman, royal coachman, Montreal, Canada, Seth Green, professor, both blue and yellow, claret, governor and alder. Brown hackles are of course always good; with a dash of color, as red tail or body, they are especially good. A gaudy fly with red or claret predominating, is best in our larger streams, coming from the snow mountains, while in the smaller streams, close to the Sound, a fly of quieter hue seems to be best.

About sundown an acquaintance from Seattle hove in sight. He was returning from a trip to the Kittitass Valley, and when he came in sight of our camp was meditating on the probable amount of enjoyment he would be able to get out of a night spent alone in that wilderness. He greeted us with a shout of relief, and, if I could judge from the expression of his countenance, was very much relieved at finding us. He spent the night with us and was off early in the morning. Satiated with the sport of the afternoon, we bethought ourselves of supper. Selecting a cosy place for a camp, E. and the writer prepared the meal of trout and grouse, while S. and our guest busied themselves in cutting boughs for bedding, looking after the horses, and getting firewood. After supper we turned in, as we fondly imagined, to sleep. But hardly had darkness settled down on the earth when our ears were saluted by the fiendish yells of what seemed like a thousand coyotes, but what was probably only three or four. The noise they make is almost indescribable to one who has never heard them. A sort of a combination of the howling of a dog and the braying of a jackass, delivered in double quick time, would be as near as I could come to expressing it. These charming beasts kept us awake for some two or three hours. They kept just out of shotgun range, and after two or three ineffectual shots into the darkness, we gave it up in disgust. They finally left our neighborhood, and we settled down to sleep.

After an early breakfast, we bade farewell to Lake Kichelass, and started for the foot of the mountains. Our road followed the general course of the Yakima River through groves of pine, and through little prairies. We occasionally caught glimpses of the river, which grew larger and larger with each view, until at our first crossing it was quite a respectable stream. At this crossing we did not ford, but led our horses across a huge log hewed flat on top. Following down the river, on a continuous down grade, through a beautiful country most of the way, after a thirty mile ride, we came out upon the summit of a bare hill about a thousand feet above the Kittitass Valley. Below us was the level expanse of the valley, traversed by green lines, which marked the course of the streams, and checkered with green and golden wheat fields. Winding through the valley till it was lost to sight in the distance, was our friend the Yakima River, and some fifteen miles away, near the river, was the little town of Ellensburg.

A gentle descent of about five miles brought us to the foot of the hill in the valley, where we found the residence of an old Seattle friend. We dismounted and waited while he had dinner prepared for us, and after partaking of that meal, started for Ellensburg, which we reached after a pleasant ride of two hours between grain fields and meadows. We had now reached the region where prairie chickens abounded, and we flushed great numbers of them, taking in a few on the way. At Ellensburg we put up at the only hotel in the town, and after supper hunted up some friends who were living there.

The town was small. There were at the time of our visit about one hundred inhabitants. It is in the center of the Kittitass Valley, which is, perhaps, the finest and most fertile valley in the Territory. It is a great stock region, and is also a fine wheat country, and great quantities of both are raised. There is no outlet for the valley at present, however. All freight has to be teamed from the Columbia River, nearly one hundred and fifty miles away. The country is quite thickly settled at the present time, though there are still large quantities of Government land open to settlement around the edges of the valley. A railroad across the Cascade Mountains will, in a very few years, become a necessity, and this road, when it is built, will unavoidably follow almost the same route we had traversed, passing through this valley and making it a very rich community with its great resources.

The Yakima River runs close by the town, and the next day we amused ourselves catching salmon trout with bait in the river. They would not take a fly, but would take a baited hook the moment it struck the water, and being very gamy afforded fine sport. They averaged about two pounds in weight, and we kept the sport up until it became monotonous. The next day was our national holiday, and was celebrated in a becoming manner by the people of the valley. Several companies of soldiers were at this time stationed temporarily in the valley, about five miles from town, and thither we went to join in the celebration, which was to be held at the soldiers' camp. A pavilion had been erected, and there were orations, dancing and dinner for all. During the day a summer shower drove us to shelter. I found it in the baker's tent, and spent a pleasant hour talking to him and feasting on his pies and cakes.

We spent the night at Ellensburg, joining in the dance in the evening, and the next day was whiled away alternately with the trout and lounging about the town. In the evening we started for Yakima City, thirty-five miles down the river, having preferred to wait and travel by night, thus avoiding the heat. Riding all night, morning found us at the camp of a friend who had a contract for building a road through the Yakima cañon, about six miles above Yakima City. We yielded to his solicitations to stay a few days with him, and made preparations to camp. Trout were abundant in the river, so were prairie chickens in the fields below the cañon, likewise rattlesnakes on the rocky sides of the cañon, and we spent the next three days in making war on the three, with great success. Rattlesnakes were so abundant here (and these were the first that we had seen) that it was a common thing to kill twenty in a day's fishing or shooting. After three days of this we moved on to Yakima City, a pleasant farming village of three hundred inhabitants. Here we found an itinerant photographer, and improved the opportunity to have our pictures taken. I regret that I cannot present them to the readers of the FOREST AND STREAM.

After a few days stay here, during which time we made numerous raids on the prairie chickens and trout, E. found his time was growing short. So, as I had determined to extend my journey to Walla Walla, I left my companions to return the way we had come, and leaving them my horse to be used as a pack horse on their return, at 6 A. M. of a beautiful morning, set out in a buckboard, in company with the driver and the United States mail for a 130 mile ride to Walla Walla. I reached that busy city after an uneventful ride of two days.

Thus ended one of the most enjoyable trips it has ever fallen to my lot to make. E. and S. returned home over the same route we had come, while I, after a two months' stay in Walla Walla returned home via the Columbia River and Portland, Oregon. ALKI.

PORTLAND Oregon.

Natural History.

A HYBRID SHEEP.

Editor Forest and Stream:

There is now to be seen in this city an interesting hybrid between a male bighorn (*Ovis montana*) and a female domestic sheep (*Ovis aries*). The animal is a male, and is about three years old. In size it is intermediate between the common sheep and the wild species, being about as tall as a large Shropshire ram, but shorter-bodied and with the appearance of much greater strength and activity. Except for the difference in the horns and the fact that it has a rather long tail, this animal resembles an undersized specimen of *O. montana*. The horns are like those of the male bighorn in shape, that is, they do not make a complete turn, but are very much more slender than in that species, being considerably longer in proportion to their thickness at the base. The general color of this specimen is very pale gray or whitish, much the same as that of *Ovis montana* in winter. It thus contrasts strongly with the male bighorn, which is its companion and father. It is wholly without the distinctive markings of the wild species. Its domestic origin on one side is shown by its slender tail, which is about seven inches in length, while that of the adult bighorn, an animal twice as large, is not more than two inches long. The coat of this hybrid, while showing a considerable admixture of wool, consists, like that of the wild species, mainly of coarse, brittle hair, beneath which the wool grows, as on *O. montana*, *Antilocapra* or *Cervus canadensis* in winter. It appears to have somewhat more wool than the wild species. I am inclined to think that the animal has not yet entirely shed its winter pelage, and that when it has got rid of this, it will show no more wool than a wild sheep does in summer, and that it will then resemble this species more closely in color than it does at present.

The history of this specimen, so far as it can be learned, is somewhat as follows: Four years ago the Ernest brothers, cattle men of Wyoming Territory, north of Rawlins, captured a male mountain lamb and tamed it. The same year they had about the ranche a pet female merino lamb, and these two grew up together. From their union this hybrid sprang. The male parent and this specimen were purchased by Wm. F. Cody for his Wild West show, with which they now are.

Although I have, in the past, heard vague reports of the existence of hybrids, similar to the one above described, I have never until now been fortunate enough to see one. Nor do I think that it is known generally that these occur.

GEO. BIRD GRINNELL.

NEW YORK, June 22.

"THE COUESIAN PERIOD?"

Mr. Chairman Section of Avian Anatomy, A. O. U.:

DEAR SIR—Thanking you for your courtesy in "taking cognizance of my communication," I would remark that I regret not to find any reasons for dropping my incognito. I asked a few simple questions. This did not pretend to be a "manly" deed, so I fail to see that it indicates a lack of "manliness" not "to attach my proper name" to them; my name is completely immaterial; any member of the A. O. U. might have put the questions (especially, perhaps, any member of the "Section of Avian Anatomy"), nor do I fully understand why it should be beneath the dignity of the esteemed chairman to be guilty of answering a few harmless questions of a purely technical nature, even if asked by an anonymous questioner; nor why it should be necessary to know the name of the writer who put such questions as: "Is it logical to name an epoch before the epoch has expired? How do you know that the epoch will expire in 1900? Whence comes the privilege of a botanist to name epochs in ornithology? Do you know that Baird, Brewer and Ridgway's grand work is still in course of publication? Are not the leading features of the present American ornithology still 'Bairdian,' and what are the scientific features distinguishing the new epoch from the past?" I say why should it be necessary to know the name of the man asking these questions in order to answer them properly? The esteemed chairman asserts that he is "too old an ornithologist to be caught 'gunning in the dark.'" I do not know your exact age as an ornithologist, but I refuse to expose my proper name as target even for your "gunning" in broad daylight. The questions are of importance, not my name. It is not a matter of persons, but of principles.

I am extremely sorry that you refuse to answer these questions until your curiosity as to the authorship be satisfied, not so much for my information, but for your own sake, as there really are persons so perverse that they insisted upon the article being "unanswerable" in spite of your assertion to the contrary. Of course I refused to listen to such talk.

But my questions are not so purely anonymous as they seem to be. We have an old saying in that part of the country in which I used to live: "Name me your friends, and I will tell you who you are." Now that is what I did, and so you should be able to tell who I am. "Doctor Socrates is my friend, Professor Plato is my friend, but Miss Veritas is more my friend" is the fit translation of the very correct Latin of the very old phrase,

AMICUS SOCRATES, AMICUS PLATO, MAGIS AMICA VERITAS.

WERE WE SUCCESSFUL?

THERE are times when one gets nearer to nature than others, and so there are times when one enjoys throwing aside the cares of business, and can go hunting, boating or fishing with more zest than at others.

All will probably agree with me that the true sportsman is one who while keenly enjoying his sport, engages in it not for the amount of game he may secure, but for the recreation and rest from business his excursions bring him, and who measures his success by the amount of pleasure derived from them. He enjoys a fine bag of game as well as any, but the mere securing it is not the highest and best part of his pleasure. To such an one a day on the water or in the field may be a great success, and he not have a feather or a fin to show for his endeavors. One of the most pleasant and profitable days the writer ever enjoyed in nature's solitudes largely partook of this character. It was a bright warm day in early June as for time, and the locality Spirit Lake, Iowa, and its vicinity. The day's adventures began before sunrise, when, breakfast over, two of us left camp to visit a colony of cormorants that inhabit a small island in Loon Lake, a pretty sheet of water just over the Iowa line in Minnesota, and on the banks of which we were camped. The surroundings were such as make one feel this is a lovely world, in which existence is a joy.

On one side of the lake, for two or three miles, the forest, just putting on its freshest, brightest green, sloped gently down to the lake, while on the other side was the broad prairie, covered by an emerald carpet, coming in places down to the water's edge so gently that one could scarcely distinguish a mile away where prairie ended and water began, and again breaking in bluffs fifty feet high, almost perpendicular from prairie to water. In places here and there along the shore were bright-colored boulders, lifted by nature's forces into symmetrical walls, for this is one of the famous walled lakes of this region. Directly before us was the island, rearing its head fifty or more feet almost sheer from the water, crowned by a clump of trees and bushes growing in such a position that it required no vivid imagination to fancy it some ancient castle, built there where it were easy to defend it from any foe.

The bright waves were rolling directly toward us, driven by a smart breeze, while prairie and forest, water and land, bathed in the bright, warm spring sunshine (for in that latitude June is a spring month), form a picture of such entrancing loveliness that one would seem never to tire of watching it. Nor was it a picture devoid of life—hundreds of cormorants wheeled through the air or swam on the water about their island home; here and there could be seen flocks of wild ducks, smaller birds of various kinds were everywhere, and an occasional splash in the water showed that its finny inhabitants were busy, and we knew from our experience the day before that they were numerous.

Our boat was a canvas skiff, ten feet long and weighing,

oars and all, thirty-five pounds, and would skim over the water like a duck, especially when J. W.'s strong arms were the propelling power, and on this excursion, at least, it was my good fortune to lie in the stern pretending to steer the craft with a bit of a paddle, but really enjoying myself watching nature's panorama as one only can when just released from a long imprisonment at hard labor in a newspaper office.

A close inspection of the cormorants and their island "pied" the romance of that baronial castle very suddenly. The east wall of the island is their nesting place; there were many generations of nest built on nest, probably for hundreds of years, every jutting rock or stunted tree that afforded a foothold being utilized. Not a spear of grass, a weed or a bush attempts to grow on this side, the rocks and clay being kept bare by the birds scrambling among their nests, the only vegetable life being a scattering grove of discouraged-looking ash trees, small in stature, yet presenting the appearance of aged and bent men who had once been larger, but were gradually shrinking up ready to blow away, as the Californians who never claim to die are supposed to do. Candor compels me to say that the home of these birds is the filthiest and worst smelling place I ever saw. Bullheads seem to be their favorite diet. These they bite off just back of the gills, leaving the head to rot, and there were hundreds of them strewn all over the ground.

An hour and a half from the time we started brought us back to camp; the pony was harnessed to the wonderful shay (a veritable rival to the deacon's), our boat and accoutrements loaded, and in ten minutes we were off for Spirit Lake, two or three miles away. This is the most famous fishing place in Iowa, and we would fain try its piscatorial possibilities. Coming to Little Spirit Lake first by the route we took, however, fancy led us to try our luck, thinking to accomplish something, J. W. being intent upon specimens for a collection of shells, while I had an ambition for fish or fowl, and carried gun and tackle.

The boat was soon launched, but finding the water shallow I did not attempt fishing. The ducks wouldn't come near me or let me get near them. A large blue heron waded along the woody shore, almost within gunshot, but the sunshine was warm, the scenery was fine, and it required an effort to get over that "almost" and come within shooting distance, and where was the good of killing it anyhow. It loved life as well as I and was no use to me dead, besides I would probably fail to get it if I tried, so drifted on and left it to its fishing. I watched a muskrat that probably took my boat for a floating log and wanted to get acquainted, and enjoyed myself hugely until a shout from J. W. warned me that he had made the detour of a long arm of the lake and wanted me, or more probably the boat, and I aroused myself and went to him. He had his shells, and I—I had a good time. Spirit Lake was reached long before noon, but so late that it was useless to attempt fishing, as they do not bite so well through the middle of the day. Shell hunting could go on, however, and did, but I not being an adept took myself to the clean sandy beach and laid down in the sunshine to watch the water fowl that came by, the waves that ran from me, an occasional sailboat that scudded along perhaps miles away over the clear, sparkling water, to dream of the stories of this wonderful place and lazily wonder if "Minnie Waukon" was yet watched over by the spirits so feared and respected by the Sioux, and if the ghost of old Inkpedotah ever comes back to visit the place where he made his last stand for the honor of his people, and if he did what would the old chief think of Hotel Orleans, that was visible eight miles away through the hazy air, looming up like some tower-crowned fortress, and to sleep.

Drops of water on my face and a sharp crash of thunder started me, to see J. W. standing near, watching with an amused expression my awakening by the shower that had, while I slept, come up as noiselessly as the Indians I had been dreaming of. Rubber coats were donned and soon the shower passed away, leaving the air purer, the leaves brighter and the water clearer and us ready for sport. Want of space prevents me narrating the successes of that afternoon, but, dear reader, I appeal to you, if this ended the day, were we not successful? W. S. P.

CUNNING AS A FOX.

THE term "cunning as a fox" is by no means an ill-jointed figure of speech. Those who know best the habits of the fox are the most ready to accord to him the well-earned epithet "wily reynard." Not only is he careful of his own reputation and life, but he has a sort of a masonic solicitude for all of his craft. Two incidents, as related by eye-witnesses, will serve well to illustrate this.

Near the boyhood home of one of the writer's old college professors there was a high hill. Its rocky sides were covered with small trees and bushes. Here and there were fissures and small caves, occupied in earlier days by bears and other animals. The larger animals had all retired before the tide of civilization to more desolate solitudes. One old fox seemed to hold undisputed sway of the wily throne. On a smooth surface of the rock near the summit she would remain for hours planning her campaigns and nightly raids on neighboring farmyards, while her young gamboled about her. From her outlook on the hill she could plainly discern the fowl in the yard of our friend, who lived under the shadow of her home, but her cunning (or reason shall I call it?) would not allow the thought of molesting them. She seemed to well understand that she and her young could be seen by the family, hence she reasoned that if fowl disappeared from the yard the theft would be charged upon her and her life would be sought.

Whatever her mental processes, she was never known to molest the farmyards nearest her retreat, but would often go miles from her home and there make havoc at the expense of some poor farmer. Her cunning enabled her to surely retain her home and prolong her days.

Another incident will show the solicitude that foxes have one for another. In Northwestern Maine there lives an old man who has become an expert trapper. One of his chief delights is to distance any other man in the number of foxes captured. While on a vacation last season I chanced one day to fall in with this famous trapper, and had from his lips the following: "I became satisfied years ago that foxes often helped their fellows out of trouble. Not long ago I went out as usual in late autumn and set some traps for foxes. Sickness called me away from home, so that I did not get an opportunity to visit my traps for more than a week. In the mean time there had been a light fall of snow. When I had a leisure half day I shouldered my gun and went out to see what the sport was. My traps were all unmolested except one, that was nowhere to be found. I began to circulate around the place where it had been, taking a wider and wider sweep every time. At length, about a quarter of a mile distant from where it had been placed, in a dense piece of woods, I found my missing trap and a fox in it, fast by the leg. The old fellow was remarkably fresh and active, although he had been in the trap apparently for some days. The snow about him was well trodden down, and lying all around him, within his reach, were an abundance of dead mice. If his fox friends could not release the captive they were determined that he should not starve."

B. S. RIDEOUT.

BIRDS AND THE ELECTRIC LIGHT.—Probably few persons have an idea of the great numbers and varieties of birds which pass and repass us in their migrations in the spring and fall. The flight of these birds occurs largely at night. Lighthouses and lightships have usually been selected as stations for observing these migrations. On starlight nights no birds are seen from these stations, but on dark, rainy or foggy nights they apparently become confused in their flight and dash against the lights, to which they are attracted, with such velocity that large numbers are killed, or, blinded and stunned, flutter to the ground. Tuesday and Wednesday nights were favorable for making these observations about the electric light on the standpipe in this city. Between the hours of 1 and 2 o'clock the birds were seen in swarms about the light, and more than a hundred fell to the ground. A few were caught alive, but the larger part were dead. Prof. Holzinger, of the Normal School, reports the following species among those collected during the past two nights, through the kind offices of Engineers Botham and Higgins, at the water-works, viz.: Catbirds, grosbeaks in variety, scarlet tanagers, golden-crowned thrushes, water thrushes, chestnut-sided warblers, magnolia warblers, Carolina rails, yellow-throated vireos, black and white creepers, Traill's flycatchers, green-crested flycatchers, savanna sparrows, white-throated sparrows, Maryland yellow-throats, black-billed cuckoos, helldivers, indigo birds, and yellow-bellied woodpeckers. On Tuesday night the grosbeaks predominated, and on Wednesday night the rails. Catbirds were numerous on both nights. The birds which breed in this locality were noticeably absent.—*Winona (Minn.) Republican, May 23.*

UTILITY OF THE CROW.—Few writers have allowed the crow any credit as a benefactor; and very few farmers can be found who are willing to add any testimony in behalf of its good character, if it really has any. Not long since, having occasion to bring up the topic of ornithology with a farmer in this section, who is a gentleman of considerable observation, the immediate cause being the killing of a crow upon his farm, he said, that in view of the services the crows rendered him, he did not like to have them shot. Hundreds and thousands of them, he said, roosted in his pine wood all through the winter, and the result was an immense layer of manure, which was carried down when the snow melted and enriched his land more than all the fertilizers he knew of. The fact that few farmers are thus benefited, nullifies a portion of his might-be-inferred good qualities, for these roosting places are few in any one part of the country, since the birds collecting from far and near, pass the winter in one spot, where they can get an abundance of food. This gentlemen also states that in some mysterious manner (still more to the credit of the crow) his cornfields have been unmolested for some years past, and that too in the very face of the fact that the birds are unusually numerous at all times of the year. I would also say that the gentleman spoken of is well acquainted with the birds which frequent his lands, and is able to discriminate between their good and bad habits without prejudice.—C. E. B., (Bridgeton, N. J.).

OWL AND STEEL TRAP.—On the 5th of June, H. S. Spackman, of Delaware, Pike county, Pa., was out looking for crows, when his dog started a large bird from the underbrush. Mr. Spackman was where he could not see the bird distinctly, but, supposing it to be a hawk, fired almost at random. The bird fell, and he thought he heard a peculiar sound as it struck the ground. Judge his astonishment when going to the place he found a great horned owl (*Bubo virginianus*), with a steel trap fast to one of its claws and three links of chain attached to the trap. The trap was of the ordinary kind used in catching mink and muskrats. It was quite rusty, and appeared to have been in its present position for some time. The writer measured the spread of the wings of the owl after it had been skinned and found it three feet ten inches. The bird had been caught just above the first joint of the middle right claw. The joint was considerably worn, as though the trap had swung somewhat as the bird flew and had chafed a ridge in the horny substance of the foot. The owl was in good order when shot and not as an owl that had to live by what it secured with one foot would be expected to be. How many poor mice, etc., must have been surprised by the rattling of a trap and the coming of a claw upon them at one and the same time? Mr. Spackman now uses his trap for rats.—A. H. G.

A RACE FOR LIFE.—It was a sultry afternoon in July. No rain had fallen for weeks and the dead leaves of last year's growth gave loud response to the lightest touch. Seated near each other on the banks of the Weoka Creek were Dr. Rawls and myself attempting to fish, but too languid to even strike at a "bite." Suddenly, to our right and rear, we heard an animated rustling of the dry leaves, and quickly looking around beheld a trout making desperate leaps toward the creek, hotly pursued by a black snake. It was a most exciting race, and so closely contested that it was quite uncertain whether the trout would reach water and safety or the snake win a dinner of fresh meat. Finally by one mighty effort, the trout leaped into the creek, and the snake halting on the bank, with head elevated, peered over, the very picture of blank dismay.—WATOOLA.

FISH AND SNAKES.—*Editor Forest and Stream:* In the issue of June 19 an article entitled "Fish and Snakes" recalls several incidents that have come under the writer's observation during the past thirty years of fishing and sketching. Thirty or forty years ago Ulster county, New York, would, I think, have taken the prize for snakes in variety and number, especially the Lower Esopus, for water snakes, four to six feet long, thick, of a grayish dark color on back, belly light and black, like a chess board. Several years ago, in Wallingford, Conn., I was walking along a brook. In a still portion among the weeds I noticed quite a disturbance in the water. I waited a few moments, when I noticed a snake, in a very lively manner, leave the brook with something in his mouth. I crossed the brook and followed the snake up an inclined bank among the grass. After it had reached some forty feet, I went up and struck it with a stick. It had in its mouth an eel some fifteen inches long. After I had struck the snake he dropped the eel, which immediately made a bee line for the water, swimming rapidly away. This snake was in shape very much like the usual black snake, lithe and active, color—back dark, belly checkered of light and deep orange yellow, like deep orange chrome. Is the variety poisonous?—J. W. [No.]

PAINTED FINCH ON LONG ISLAND.—Bay Ridge, L. I., June 16.—*Editor Forest and Stream:* While watching birds at the tank this morning, I was surprised to see a painted bunting (*Cyanospiza ciris*) among the number. The colors were well pronounced, the bird evidently having reached full plumage. No firearms being at hand, the specimen was unfortunately not secured. Wilson speaks of it as being numerous in Louisiana, and sparingly further north. Dr. Coues does not include it in his New England list.—A. L. TOWNSEND. [The occurrence is well worth recording, as this is entirely out of the bird's usual range. At the same time, the species is a common cage bird and may have escaped from captivity. We have more than once freed specimens and believe that there are one or two records of the bird having been taken in this vicinity.]

Camp Fire Flickerings.

"That reminds me."

120.

CAPTAIN BILL ELDRIGE was just pulling his boat ashore after a duck hunt one day, when a glance across the Absecom meadow showed him the long head and neck of a blue heron. "That's my blue-jimmy," said the Captain as he threw himself on his stomach and began to wriggle toward the game. Every now and then he would raise his head to be sure that his prey was still there, and then another rod of wallowing through the salt mud. At last he comes to an "aim," and raises to his knee—only to find that he had been stalking the flagstaff and pennant of a sloop in Beach Thoroughfare, three miles away! Fact. A.

121.

Years ago, before lucifer matches and the percussion lock were invented, when the old flint lock served the double purpose of "fire kindler" and "meat getter," Jones owned one of these ancient pieces. During his absence, Smith, his neighbor, came to borrow it. Keeping it only a short time he brought it back before Jones's return; and as he hung it on the wooden hooks above the fire-place, told Mrs. J. to be sure and tell Jones it was loaded, as it had no charge in when he took it. Jones returned late at night after Mrs. J. had retired, and went to bed. The next morning he arose before his spouse was awake and prepared to make a fire. Taking the gun down he put the tinder in the pan, pulled back the hammer and pressed the trigger, when boom went the gun. Mrs. J. sprang to a sitting posture in the bed at the report and yelled, "That gun's loaded." Jones carefully looked at the smoking piece, then at a hole made by an ounce ball in the head-board of the bed about six inches above where his wife's head had been, and then drawlingly said, "I'll be durned if it is." PEDAGOG.

122.

Uncle Jim C. was narrating to an appreciative audience some wonderful fish stories, and finally wound up by telling of an immense mud turtle he had caught with hook and line, the largest by far, he was very sure, that had ever been caught in this neck of woods.

Walt W. (the old man's nephew, standing near and listening to all the stories) could stand it no longer.

"Uncle Jim," cried Walt, "I'll bet anything I caught a turtle the other day that will lay right over yours." "How big was it?" said the old man, "go ahead now and tell about it. Show us how large he was" (giving a sly wink at the boys). "All right," says Walt, picking up a stick and proceeding to mark out a circle on the ground about the size of a large washtub. "Pooh! pshaw!" cried Uncle Jim, "you don't call that a large turtle do you? That's a mere terrapin, a nothing; why boy, my turtle was"— "Hold on, Uncle Jim, hold up," yelled Walt, (who saw that he was about to be crushed) "you are in too big a hurry, wait until I make the turtle, that's only his head!" A. T. R.

THE WILD WEST SHOW.

MANY of our readers may imagine that the Wild West Show, now open at the Polo Grounds, 110th street and Fifth avenue, in this city, is an ordinary circus performance, and that the exhibition is in popular parlance a "fraud." This is in no respect true. The men connected with it are, as a rule, just what they are represented to be, and the show gives, as a whole, a graphic picture of life in the Far West as it was a few years since, and no doubt still is in many places. Curiously enough it happens that many of the scouts, cowboys and Indians are men with whom in past years, long before the idea of this show was conceived, we have been associated in the West. Fifteen years ago this very summer we crossed the Nebraska sandhills under the guidance of Major Frank North, the daring white chief of the Pawnees, the hero then and since of many a hard fought battle with the Sioux, Arapahoes and Cheyennes. As Ney was among the Marshals, so Frank North among scouts and Western men, is *le brave des braves*. That same summer we first met Buffalo Bill, then post guide at Fort MacPherson. A year or two later we made a summer hunt after buffalo with the Pawnees, at which time we first met old *La-sharoo touraheh* (Good Chief) and *La-tah-kats tah-kah* (White Eagle), Skeedee chiefs, who are now with this troupe. Later still we stopped for a month or two in different years at the old ranch on the Dismal, where Buck Taylor was cowboy, riding the range and any bucking horses that showed up. Many others of those belonging to the troupe we have known, and the genial ex-sheriff of Platte county will remember having given us a "quiet place to write" some letters to FOREST AND STREAM.

Of the show itself, it may be said that it is in the highest degree realistic. Cody is perhaps the best horseback shot known. Bogardus's skill with the shotgun is familiar to all. The Indian fighting and buffalo hunting are very true to nature, while the roping and riding is superb. The Mexican vaquero Escabel, who rides the bucking mule, is, we think, the best rider we have ever seen, though Buck Taylor, Jim Lawson and others, can "stay with" a horse about as long as any one.

The whole exhibition brings back to our mind so many happy memories of life in the Far West that we confess to a good deal of sympathy with the New York *gamin* who said to his companion: "Say, Johnny, I'd like to take in dis show every day, and twice a day on Sundays."

Game Bag and Gun.

SMOKE MEMORIES.

It makes a difference which end of a match you try to light.

WE had met for planning where to lay out our first day's work on woodcock for the season. The old set were there, Jim, the three Johns, viz., John, Ho-John and Demi-John. Jim said he would be obliged to be absent for one, but a young man from New York, a first-rate shot and all that, would represent him this time; he knew all about him, as a cousin had written regarding him, and in his club he was counted authority on all sports pertaining to dog and gun. Jim also went on to state a good many things in his good-humored way, trying to gain our good will toward the stranger, and as usual, said so much as to make us suspicious that the man was something of a boaster, or not quite up to his professed capabilities.

With the evening train the man arrived and was introduced to us as Mr. Abel Nye, of New York. He had a good lot of luggage for two or three days' shooting; and everything in the sportsman's way had a new, unused look. The gun case wasn't frayed, bauged or rusty; the big sole leather trunk, also new-looking, wasn't our sort; but we greeted the newcomer cordially, and after a short chat he went into supper and we sized him. Jim had gone with him, and so we talked as we thought. John was the landlord, so Ho-John and Demi-John were the sizers. Ho said, "The chap's a fraud." Demi said let us draw him out and see. Agreed. Presently he appeared with Jim, and feeling pretty nicely, as most people do after one of of John's suppers, began to talk of what he had done in the past in the field and what he proposed to do on the morrow. We very soon had his caliber. He opened his gun case showing a brand new piece, and pulled out of an ammunition case from his trunk some new-fangled shells, and discoursed like a drummer over their virtues beyond other kinds; in fact he made an ass of himself.

By and by he went out for a walk with Jim; then we put up the job. John, the landlord, joined us, having come to the conclusion we had during supper from overhearing his conversation. The plot was this: A bet was to be made and dollar events were to be scored, based on his previous statements. First, that he would have first shot and would not get his bird; second, he would have the lowest score for the day's shooting; and third, he would not kill a single bird in the whole day's shoot. While away he had left his ammunition box out upon the table, and we took a corkscrew and drew all the wads which covered the shot and replaced the pellets with pieces of bar soap and then put the wads back again. It was quite a job, but we had finished some time before his return. By and by he dropped in, Jim having bade him good night and gone home. He soon resumed his boastful talk, and this being what we desired, we soon had our bets taken and went to bed contented.

Early in the morning we were out. Nothing could have been more superb—weather, dogs, birds, everything. Fan put up a bird inside of five minutes after we commenced work, and it got up lazy, too, giving Nye a splendid shot. I watched him; he did throw up his gun as though he had had one in his hand before and wasn't a bit excited; fired, and of course scored a miss, and John knocked over the bird on a long shot. Nye seemed surprised, but only remarked, "I expected to lose the first bet." As the day expanded and he missed good shot after another I really pitied the man, for I had long before come to the conclusion that he might be a "good un," even if he did talk too much; and presently I suggested to John the idea of getting a real shot cartridge into Nye's gun so he might kill one bird and win at least one event. But no opportunity offered. However, I saw that old John was getting close to Nye, and then I "smelt rat." Presently up popped a bird and both Nye and John fired and the bird fell, the guns making one detonation, Nye looked at John and not seeing him reload retrieved the bird exultantly, as well he might. I did not know this at the time.

Soon afterward we started for home, and on our arrival laid out the birds on a table in the office, and we all laughed at Nye for losing all events. Much to our surprise, John, the landlord, informed us that Nye had killed a bird, which, of course, we all doubted and asked for proof. Nye, poor fellow, with his ill-luck all day bearing upon him, had forgotten his bird, and going to his shooting coat hanging against the wall, produced a fine woodcock, which he added to the pile on the table. Ho-John picked it up and looked it over, and handed it to me without a word. I looked it over also, and found a bit of soap under one wing firmly imbeded in the flesh. I laid the bird down with the remark, "You can't dodge that, Nye has won one event at least."

After supper we squared bets and smoked our pipes as only tired men can. Presently Nye strolled off to see Jim, and we were free to talk about woodcock being killed by soap. "Soap," we knew, would buy them in and out of season, but killing them with soap was another thing. Landlord John was called to assist us and explained matters, after he found the bets were settled. While we were talking he had slipped out with a woodcock and placed the piece of soap where we found it. The joke was now upon us, and when Nye returned we told him the whole story—why we had put up this job and how much worse we were sold than he. We assisted him in replacing shot for soap, and found the next day he could shoot almost as well as he could boast. REIGNOLDS.

RIFLES FOR SMALL GAME.

IT has never been my good fortune to be so situated that I could do much hunting large game, so my rifle shooting has been confined to target shooting, hunting squirrels and other small game. Squirrel hunting with a small rifle is my favorite sport, and a good rifle for that kind of work is what I have been trying to get for some time. I formerly used a small muzzleloader that was all right in its day but is out of date now, for hunting. The past three or four years I have used a Maynard .35-caliber. It is a good gun, but is too large caliber for small game, so about two months ago I ordered a .22-caliber barrel from the Maynard Company to fit on the same stock as the .35 barrel. Not having much faith in rim-fire cartridges (as they are now made), though I would experiment a little on a central-fire shell for .22-caliber. Made a few brass shells long enough to hold 10 grains of powder, and large enough to take in the bullet full size at base. The bullet I made the same shape as the one used in the .35 caliber, and it weighed 35 grains, one part tin to fifteen of lead; chambered the barrel to fit this shell and bullet. After giving them a thorough trial I was so well satisfied that I have since made all that I need. They shoot very strong and accurate with the sights adjusted for 50 yards. I can use the same sights for any distance up to 75; for 100 yards requires a little elevation, using Hazard's electric powder No. 3. The inclosed target is of 12 consecutive shots at 50 yards, with muzzle rest, without cleaning. The string measures 6⅜ inches. This shows it to be accurate enough for all practical purposes at that distance. At 100 yards the accuracy is about the same in proportion, and that is about as far as a man generally shoots at small game. I write the above for the benefit of sportsmen, and to try and induce manufacturers to make a better class of ammunition for small-caliber rifles. The rim-fire cartridge is good enough for pistols but is no good for rifle shooting. They don't hold powder enough, and the bullet being compressed at the base destroys the accuracy. What we want is a cartridge holding at least 10 grains of powder, and made the same style as the best large-caliber cartridge. Such a one might cost a little more, but most any one would be willing to pay a little extra for a good cartridge. H.

AURORA, Ill., June 10.

THE CHOICE OF HUNTING RIFLES.

Editor Forest and Stream:

In re choice of hunting rifles, I would like to add not arguments, but one or two plain statements of facts which may have some bearing upon the points of issue. In a tramp through Colorado and New Mexico, I used a .44-95-280 Sharps "Old Reliable." My pard, Ignotus, clung lovingly to his Winchester, model '76. One day we were up in the "Needles" after mountain sheep. Climbing one of its steep trails, we thought we saw, on the face of the cliff above, indications of a silver "lead." Leaning our rifles against the cliff, we scrambled up and began prospecting. One of us dislodged a stone, which rattled down, struck the guns, and knocked them over the cliff. They fell perhaps fifty feet. When picked up the Sharps showed several dints in the stock and one or two small scratches in the barrel and nothing more. The Winchester had the cock broken short off, the lever jammed so it could not be moved and the magazine bent badly. It had to be sent to Denver and repaired, at a cost of about twenty dollars.

Again: We were out one day, Ignotus one side of a ridge and I the other. Suddenly I heard a furious fusillade from his direction. Climbing hastily to the top of the intervening ridge, I saw him "pumping lead" (pardon O King! but nothing else will express it) into a big cinnamon that was coming at him about a hundred yards away. Every time the Winchester cracked, "Old Ephriam" would snarl, bite the spot where he was struck and keep on. When I spoke to him through the medium of the Sharps, he tumbled over, rolled down the hill, recovered himself and lay moaning. The second shot killed him. Six Winchester bullets hadn't stopped his rush; one Sharps stopped him, the second killed him.

Again: He and I had to go out at once to shoot for meat to supply a camp of twenty men. Deer were tolerably plenty, but wild, and Ignotus could shoot and hunt "all around" me. Results—Winchester nineteen shots and six deer—one struck three times, three struck twice. Sharps, five shots and four deer, none struck twice. "The p'int of these facts lies in the application on 'em." You can draw your own conclusion. Mine is, as regards the Winchester, that "for people that like that kind of a thing, it's about the kind of a thing such people would like." H. P. UFFORD.

DELAWARE, O.

NOTES ON "WOODCRAFT."

Editor Forest and Stream:

"Woodcraft" received, and it is needless to say, that, having once opened it, I didn't lay it down till I had finished it. Bless old "Nessmuk's" soul! How I'd like to grip his hand once and sit on a log and hear him talk. And yet, though I'm probably not half his years, I have the impudence to differ with him on one or two minor points which I will have the boldness to unfold.

First—As to knives. He says, "let their temper be of the best." That, I suppose, means first-class steel. Experience has taught me that a finely tempered steel knife, away from "scissor-grinders" and "sich," is a never ending cause of wrath and objurgation. The first week or two its razor-edge is admirable; then it gets dull and a nick or two comes in it, and your pocket wetstone (if you haven't lost it) is but little use to restore its pristine keenness. The best knife for "outing" purposes that I have ever seen (and I have tried a score or more), is the common, cheap, soft iron, Sheffield butcher knife. The blade is thin and will take as keen an edge as a razor, while, if in cutting it meets a sudden obstruction, the edge bends instead of nicks, and can easily be hammered straight again with a couple of stones. When dull, a razor edge may be given to it with the same labor that would hardly put a polish on the tempered steel knife.

Second—His four pans and camp kettle are good so far as they go, but a pressed tin coffee pot, made just large enough to fit snugly into the kettle, into which are slipped his waterproofed muslin bags of coffee, tea and sugar, and two or three strong tinned teaspoons and a fork or two, will add nothing to bulk, but a few ounces to weight, and a hundred per cent. to convenience and comfort.

Third—"*Chacun a son gout,*" but I wouldn't wear a pair of boots in the woods if I had to go barefoot. Did you ever try to get a pair of wet boots on over a pair of damp socks? "Nuff ced!" A pair of moderately high-low, strong calf skin, buckle shoes, with, for muddy or wet places, a pair of half-leg, thin canvas, three-buckle leggings, are, methinks, the *ne plus ultra* of foot gear.

By the way, may I suggest an addendum for a permanent camp, which I have found, if not "a thing of beauty" yet a "joy forever," where used? It is the "scrap-kettle." On first going into camp, set aside for this purpose your largest camp-kettle, and into it put every day the scraps that would otherwise be thrown away—the heads and feet of small game, giblets of fowls, scraping of soup kettle, cold potatoes, beans, tomatoes, rice, crusts of dry bread, with an occasional onion or red pepper for those that like them. Fish are good therein, if you don't get in too many small bones. Anything eatable, in fact (and some that are not, as marrow-bones, squirrel tails, *et al*) and clean, may go in. Keep the pot setting by a corner of the fire-place all the time, where it will keep warm, adding a little water, and when you want a hurried meal occasionally, dip out a panful, heat up on the coals, and you have a savory mess that will make you smack your lips with gusto.

I wonder if your correspondent who, in a late number, recommended "cheese and potash," has ever tried his own recipe? I did, following out his instructions carefully, with weighed and measured ingredients. Results, about a quart of thin, greasy fluid, which wouldn't "set like a custard" for any consideration, and a mass of indigestible, straw-colored gutta percha stuff, as edible as so much raw-hide. The family turned up their noses at the mess, and voted "cheese and potash" a fraud and a snare. Will your correspondent "rise and explain?" H. P. UFFORD.

DELAWARE, O.

WILDFOWL IN NEW BRUNSWICK.

Editor Forest and Stream:

In looking over some back numbers to-day I saw in your issue of April 24 a communication signed "C.," in which he says he lives on the Straits of Northumberland, and never saw the time when 100 birds could be bagged in a day. The statement may be true, but I doubt if your readers are particularly interested in what such correspondents have not seen. I have lived on the same shores all my life, and I can name several gunners who during the past spring have repeatedly come ashore with a bag of over a hundred of geese, brant and ducks, not "including coots," and the shooting was done from boats. True, an occasional tenderfoot, lacking the courage to try the boats, sets up on the board ice with decoys, but by far the greater part of the gunners use the boats mentioned.

During the week when "C." said the largest score was five geese and one duck, three different gunners brought in bags ranging from forty-three to sixty. If you would like bottom facts about this matter inquire of Mr. Tom Trenholm or J. O. C. Goodwin, veteran gunners of Cape Lormentine, who have killed thousands of shore birds where "C.," judging from his own statements, has killed units.

CAPE LORMENTINE, N. B. D.

THE TURTLE LAKE CLUB.

THE Turtle Lake Shooting Club was incorporated a few weeks since under the State laws. This is the organization referred to several months since in FOREST AND STREAM as having secured the shooting and fishing privileges of one of the finest deer countries of Northern Michigan. The club starts with a paid in capital of $2,000; membership limited to twenty, and its headquarters are at Detroit, Mich. I know of no finer deer and ruffed grouse shooting than can be found in the domain controlled by the club, while the lake upon which their camps are situated swarms with black bass and muscallonge. The officers and members are: E. H. Gillman, President; W. C. Colburn, Vice-President; Frank W. Eddy, Secretary and Treasurer; Fred. A. Baker, Judge J. J. Speed, Howard Barnes, William P. Holliday, H. W. Avery, Directors; all of the foregoing are of Detroit; other members are—Col. Morrison, of Locke Haven, Pa.; M. S. Colburn, Factory Point, Vt.; J. J. Parris, Bennington, Vt.; Harry S. New, Indianapolis, Ind.; Col. J. E. Pepper, Lexington, Ky.; J. J. Gore, Chicago, Ill.; Ira A. Paine, Providence, R. I., with several other gentlemen whose names I have not by me.

Such organizations ordinarily call for a simple notice, but this is, I believe, the pioneer in an attempt to preserve game right in the heart of a wilderness where game laws are nearly unheard of, much less ever observed. The club have already sent a steward or rather a game keeper to Turtle Lake. Last summer over one hundred deer were killed in the red coat at that point and it is hoped that such illegal slaughter can be guarded against this season. The gamekeeper reports deer as very numerous. He also writes that the bass fishing is simply superb in Turtle Lake. Several bass he caught measured twenty-one inches in length.

I heard of a mean performance the other day. A few days since Mr. Wm. Fisher, a jeweler of Detroit, sat in his store talking with several gunners, and in the midst of the conversation Mr. F. condemned in round terms the shooting of woodcock during the close season. All present coincided or at least seemed to in deprecating the unholy practice. But the very next morning, upon Mr. Fisher's opening the door of his store, he found attached to the knob, six heads of as many woodcock, four of them having soft bills. And the end is not yet, for if the miserable, spiteful, sneaking hypocrite, who killed the brood and hung the trophies on that door, can be discovered, he will be punished roundly. "Bad cess" to him any way.

The Terra Cotta Club took a trip to Monroe, Mich., last Thursday, upon the invitation of Hon. Harry A. Conant. The trip was made upon the steam yacht Lillie, and while at Monroe the club had their regular shoot. Mr. Geo. Avery won the medal with a score of fourteen out of twenty. Mr. Gaylord took second, breaking thirteen clay-pigeons.

Mr. Mershon's account of "Lassoing a Man Eater," in last week's FOREST AND STREAM, was capital. He also has a good story about a skunk eater, but I don't believe that he can write this last tale nearly as graphically as he can act it and speak it. I wish he could, however, and the readers of FOREST AND STREAM would laugh. DELTA.

DETROIT, June 21, 1884.

THE PERFORMANCE OF SHOTGUNS.

Editor Forest and Stream:

I have been much amused and some instructed by the various articles upon shotguns in your paper. My instruction is mainly in the lack of experimental knowledge with most of the writers. But a very few know what they are writing about. General Verity is as quotable for facts as most of them.

Every one knows who knows anything of mechanical work, that a piece of metal—iron, steel or brass—fashioned by a good machine, just as parts of watches, pistols and sewing machines are, is better in every respect of fit, finish and durability than hand-made pieces, and lower in price.

Take another fact, that two barrels of the same size and finish of bore, will shoot alike, whether made of iron, steel or brass. Any one can, or should see plainly, that an American gun of low price cannot be excelled in durability and execution, by any high-priced gun of home or foreign make.

In all gun trials in this or in other countries, by government tests, no account is made of price or quality of the arm, or of the kind of metal in the barrel.

A trial of sporting guns of 12 gauge, of 28 and 30 inches, cylindrical and chokebore, in England, tested for speed of shot by electrical apparatus and proportional velocities by Bushworth's tables, shows the velocity of shot at the muzzle and at different distances from the muzzle. It gives also the distance from the muzzle, where the shot have one-half the force—striking energy—they had when they left the muzzle. No. 8 shot at 30 yards and No. 5 shot at 70 yards have only one-half the force they had on leaving the muzzle. The

smaller the shot the more rapid the diminution of force. Chokebores did not uniformly excel plain cylinders. One chokebore, which was almost a perfect cylinder in addition to the choke, excelled. One good cylinder of 28 inches excelled several chokebores of 30 inches. Too little is known of the shape of the inside of our gun barrels.

Twenty-five years ago I stood on a yacht's deck with seven other shooters. We were at anchor, resting after a coot shoot. A measured line of fifty yards was attached to a wounded loon and he swam out to its length. We had muzzleloaders, double barrel, of various sizes and bores, 8 to 15 pounds and from 12 to 8-gauge. All were anxious for the first shot; all had their chance. Each one loaded to suit his fancy, as had been his habit, for coots. Every one of the sixteen barrels was discharged; the head and neck of the loon appeared well covered every time, but the loon was apparently untouched. The gunners were chagrined and astonished. The loon was drawn in to 25 yards. The sixteen barrels were discharged at him in succession as before, and the loon was unscathed. At 15 yards the first shot dispatched him. The gunners of that party learned something. Bear in mind that in the head and neck of a loon, not over the size of one's finger presented itself for shot. Thirty to 40 yards is as far as sea fowl are usually successfully killed. I have seen occasionally a fowl killed at 75 or more yards, but always with a shot through the soft part of his head or neck.

Ask any one of those gunners what was the force of the recoil of their guns on their shoulder, in pounds, with 3 drams and 1 ounce in 8-pound gun, or 5 drams and 1¼ ounces in 12-pound gun, and he would say 10 to 15 pounds. By experiment it is 75 pounds in light guns and 100 to 125 pounds in heavy guns 10 to 15 pounds. Some gunners have an idea that gun barrels can be constructed by some shrewd makers of such a form at the breech that when powder explodes in them, it will manifest force only in propelling shot and have no recoil. If gunners would consider the propelling force requisite to drive shot 50 yards through a duck, they would readily conceive, as the force of exploding powder is equal in every direction, that equal force must be exerted against the shoulder. Witness the pains taken to check the great recoil in heavy ordnance. AUSTIN.

MAINE.

THE SHOVEL HUNTERS.—A short time ago while out with dog and gun I met a couple of that peculiar type of "true sportsmen" who, instead of glorying in the skillful use of a modern gun, go armed with impiements which require less skill to handle and cost less money, namely, a pick and shovel. They had just finished a forenoon's job, and the one stood holding a poor kicking "cotton tail" while No. 2 cut its throat. As the rabbit was supposed to be breathing about his last breath, No. 2 suggested to "throw him down and let the dog smell 'im." This was done as soon as suggested, but the dog never "smelled 'im," as the rabbit had just enough life left to run a short distance and into another hole.—BERGOLD.

LONG ISLAND GAME PROTECTION FUND.—New York, June 20.—*Editor Forest and Stream:* We have received from the Brooklyn Gun Club the sum of $25, to be used for employing detectives to secure the conviction of game law breakers on Long Island. We have also received for the same purpose $25 from the Richmond County Game and Fish Protective Association.—FRANCIS ENDICOTT AND GUSTAVE WALTER.

PENNSYLVANIA.—Mount Pleasant, June 19.—I hear Bob White in every direction. Bob wintered well here, partially owing to the fact that some farmers were unable to husk all their corn till spring. Fall shooting will certainly be grand. Woodcock seem to be plentiful also.—FARMER.

NO RUFFED GROUSE IN AUGUST.—New York, June 19.—*Editor Forest and Stream:* I see Mr. Frank Kent, of Monticello, N. Y., advertises on page 405 of your paper, to furnish partridge shooting in August. How does he manage it? Where is the game constable?—W. HOLBERTON.

NEW YORK WOODCOCK.—*The general open season for woodcock in this State has not been altered. It will begin August 1. This applies to Long Island as well.*

Sea and River Fishing.

CAMPS OF THE KINGFISHERS.

Black Lake, Michigan.—VII.

WE found the other boys enjoying their after-lunch pipes in the shade of some bushes not far from the ledge of rocks and pulled in to see "what luck." Here another serious backset struck us in the shape of a distracting string of fish—mostly pickerel—tied to each boat, which the boys had taken coming up and along the rocky shore near the Rocks, and from some of the remarks fired at us we concluded that this must be our day to cut bait, not to fish. Taking a path leading through the bushes and swamp, we started to find a spring that the Deacon said he had discovered a few rods back from the beach near an old deserted house, which we had passed shortly after leaving the Frenchman's. Dick remarking as he took the lead, tin cup in hand, "Must be somethin's goin' to happen to the Deacon when he takes to huntin' up springs and cultivatin' a taste for water."

We found the spring, boiling up out of an old barrel sunk in the marshy ground at the foot of the low hill, a good strong stream, and for the benefit of any thirsty soul who may hereafter be fishing in the vicinity of the Rocks, I will say it is the sweetest and coldest water to be found anywhere around the lake. The waters of Black Lake are several degrees higher in temperature than the waters of any of the lakes in the Six Lakes region, beginning at Fountain Lake—the upper one of the intermediate chain—and having their outlet at Elk Rapids into Grand Traverse Bay on the other side of the State, and the streams and springs running into it are not nearly as cold and pure as those of the intermediate region, but this particular one is an exception, and it is certainly worth a two miles' pull in a boat at any time to get a drink of its waters.

[Anent springs, streams, and water in general, I am moved to make another digression. My letters in FOREST AND STREAM two years ago appeared to afford right smart amusement to a few of the brethren on account of the frequent reference in them to "clear streams, cold springs, brooks," etc., and I just want to say here that, should any of them hereafter be seized with a raging desire to have a little sport over the clearness and coldness of the waters I may take a notion to write about, they will be wasting their time, for I am a water bird, in camp and out of it; as Old Ben would say, "From my topknot, plumb down to the eends o' my toes," and I am going to talk, drink and write water perfectly regardless of any little pleasantries that may be indulged in at my expense, and I want every brother of the rod who goes to these North Woods for recreation, sport and health to know where all the good springs and streams are at which I have cooled my thrapple, for one-half the comfort and satisfaction of a trip to the wilds of North Michigan is to be had in drinking of the waters of its glorious springs and streams, unsurpassed as they are anywhere for their sweetness, coldness and purity. As to "camp drinks," I concede the right to every man to drink anything that seems best to him, but my voice will always be against "beverages in camp," for they are a fruitful cause of ill-feeling, quarrels, broken friendships and accidents. They work harm a score of times where they do good not once. Let us older fellows of the gentle craft set an example to the younger generation of anglers coming after us, by convincing them by our practice that spirits and fishing do not necessarily go together; that it only makes the load heavier to balance a lunch in one pocket with a bottle in the other. Let us teach them to shun all "beverages," and encourage them, like our Deacon, to "cultivate a taste for water." Here the digression ends, and I trust it may lead many of the bibulous brethren into a "train of reflection" before the fit seizes them to air their cleverness in an attempt to make sport of pure cold water as a beverage, or hold up to ridicule those that prefer the odors of the virgin woods to the assortment of smells in a brewery.]

Back in our boat again Dick and I felt it was high time to save our reputations from total wreck by taking a fish or two; and with this end in view we left the boys to their pipes and pulled along shore to the ledge where we were sure to find a bass or pickerel waiting to be snatched out of his native element without as much as a chance to say good-bye to his nearest neighbors. We felt we were capable of performing this feat with neatness and dispatch, would some fish of convenient size only give us the opportunity, but after pulling our boat up on the rocky shore and casting for half an hour over twenty yards of water in front and to either side, we scored another backset by failing to raise a fin. Then we set our rods—a sure sign we were getting lazy—and picking out a soft place among the rough and jagged rocks near the foot of the low cliff a few feet back of us, we seated ourselves about twenty yards apart to study the case over and wait for a "bite."

For lack of something better to do while waiting for the long-expected nibble, I removed a good sized flat stone from its resting place in the clay, and in so doing left a tiny stream trickling from the rocks above soon formed a little "cool spring," which afterward fully paid for the labor expended in scooping it out. Stretched out there on the rocks waiting for the spring to clear I fell into a doze, out of which I was presently aroused by the sharp chatter of a kingfisher winding up his reel, and looking sleepily up without changing position, there sat the emblem of our club balancing himself on a limb of a projecting bush that found a precarious hold for its roots in a fissure in the rocks over my head.

He was not more than four or five feet from me, but he was too busy trying to stop the swaying of the limb on which he sat to notice me at first, when, however, the limb stopped vibrating, he peered inquisitively down at me with his keen eyes, wondering, no doubt, how that curiously-shaped old stone had found its way there since his last fishing excursion to this, his favorite preserve.

I remained perfectly motionless and he finally seemed to be satisfied in his mind that I was one of the original stones included in the preëmption claim, as after a careful scrutiny he settled down on his perch, meditating, I had a notion, on the chances of going supperless to roost, and on the "onsatisfyin' natur'" of fish as a regular diet, especially when the demand exceeded the supply—exactly Dick's case and mine for that day as near as I could figure it out. Suddenly the emblem straightened up and unwound a few yards of line, with the familiar chatter that greets the angler everywhere in his wanderings where fish are and comfort is to be had with the rod.

Then he stretched out one leg behind, as though to kick the cramps out of it, and then a like movement was made with the other one, clearly a case of "rheumatiz" brought on by too much dabbling in the water.

Hitching along the limb an inch or two, he raised his tail with a preliminary flourish and made a profound bow in Dick's direction, this unaccountable mark of politeness being repeated at short and regular intervals for at least ten minutes.

Maybe he had just swallowed a young perch and the spines of the dorsal "wus a trublin' ov his innards," or a fishbone had lodged crosswise in his throat and he was humping himself to get it down, and it may have been a habit of his nature, like the funny tilting up and down of the little "teeter'snipe" one sees wherever he goes a fishing.

When this curious and ludicrous performance had continued until I was nigh bursting with smothered laughter, I ended it by suddenly jerking my hat from my head and swinging it up near where he grasped the limb. Whish! Like a flash he went upward, rheumatics, fishbones and all, and shot out over the water, too badly scared to chatter till he was a hundred yards away, and the last I saw of him was a devious, blue streak of chatter, growing fainter in the distance, going down the lake in the direction of our camp.

That "emblem," I venture, did not 'light on another twig or dead branch that day, nor for a week without first making a careful survey of the adjacent surroundings to satisfy himself there were no odd-shaped rocks lying around loose not indigenous to the soil that were liable to blow up and scare him baldheaded.

The interest I had taken in watching the kingfisher knocked all the doze out of me, and getting the rifle from the boat I found a place nearby where I, with some labor, climbed the rocky face of the ledge and stood on top, where I got a very fine view of the lake, which fully repaid me for an abraded shin that came in contact with a sharp stone just at the hardest point of the climb. I took the rifle along because one cannot always know what manner of varmint he may meet in these woods, and a breechloading rifle is a famous implement to have about you if caught in a tight place without having carefully mapped out your line of retreat beforehand. I might chance on a bear in my contemplated ramble in the woods, and we, the bear and I, might come to a misunderstanding about the right of way, and then the breechloader would be a strong argument on my side. The misunderstanding might bring on a difficulty, and as I was not in first-class practice on bears the result would, like as not, prove I would be knocked out in the first inning, in which case Dick's verdict as coroner and jury would have been carried back to the boys in about this shape, "served the durned fool right for not stickin' to his fish-pole."

I struck back up the ridge into a burnt district of a few acres, but the traveling was so hard that by the time I reached the woods lying between the head of the lake and the State road, I had enough of it and turned off the right and came out after a while on the lake shore near Merrill's landing. I saw no bear sign nor anything larger than a ground squirrel in the shape of game. I met an old acquaintance, however, from "Eel River, Eel River," as he persisted in telling me every few rods, in the person of a "sassy" bluejay that followed me for a quarter of a mile, scolding and telling me in the plainest of jay language just what he thought of me, until I was glad when he got so hoarse he had to hie away to the lake to wet his whistle and smooth his ruffled feathers. When I came out to the lake and started along the beach back to the rocks, I was reminded that my brief bear hunt was another failure as far as it had a bear-ing on a supply of meat for the camp, but I reasoned it was best perhaps as it turned out, for had I succeeded in killing a bear, life would have been a burden for the next week by reason of the congratulations and bear stories Merrill and the boys would have overwhelmed me with, and even now, as I write this, I feel profoundly grateful to any bear that may have been loitering in the vicinity that day, that he or she, as the case may have been, did not come within certain-death range of the breechloader.

During my absence Dick, with a streak of selfishness not usual with him, had selected the very softest bed in the rocks along the shore, and when I came on him he was lying curled up in the hot sun sound asleep and snoring with a vehemence that threatened to loosen the roots of the few stunted cedars and bushes growing along the brow of the low cliff overlooking the water some thirty feet directly above him. Rousing him up, we reeled in our lines to find the frogs on the hooks dead and stiff without a mark to show that they had been disturbed. Another backset.

After a hearty drink at the little spring which was now as clear as crystal, we got into the boat and pulled straight out from shore over sixty or seventy yards of rocky bottom that to a river angler would have indicated a "powerful good place for bass," but all signs had failed us that day and we were not much disappointed at not taking a fish here, although the other boys had at this very spot taken their best bass during the forenoon.

The bottom from the ledge nearly around to the mouth of the Rainy is rocky and free from grass and weeds, the water ranging in depth from one to ten and fifteen feet for a hundred yards or more out from the shore, and I am sure it must be as Merrill said, a famous place for bass in the fall.

Stizosteth—(life is too short to waste on this word)—pike-perch also flourish in this lake, albeit those we saw were not in a very flourishing condition. We counted five, floating along this rocky shore, dead and bloated, that were from a foot and a half to two feet long, but an examination disclosed no spear wounds or marks that might suggest they han been tampering with the fighting end of a maskalonge, or anything that would indicate the manner of their taking off, and as we were more interested just then in live fish than dead ones we spent little time in conjectures over them.

As the sun was now getting well down and our poor luck appearing to stick to us like a "pheasant burr," Dick suggested that we "make a straight shoot for camp and not squander our time in follerin' the synopsis of the shore"—a suggestion that furnished an immediate excuse for me to lean over the side of the boat to again water the frogs and prevent an explosion.

Synopsis was a good word, but it fell short a couple of syllable of the word Dick was reaching for; however, it answered his purpose just as well as though it were a yard long, and the satisfied expression of his countenance as he took a puff or two at his pipe said plainly, "Old Webster mustn't come foolin' round me with his big dictionary, for if he does I'll floor him every time."

We finally decided to "foller the synopsis" and turning shoreward we fished along the streak of grass clear down to camp with—let me record it truthfully and without hunting around for worn out excuses usually taken to camp in cases of this kind—exactly the same results that had attended us the whole day; but Dick and I were in the best of humor and at peace with ourselves and all the earth, for we had enjoyed the lovely July day and the scenery around the lake thoroughly, and we felt that, as a lamented brother of the rod has said, "it is not all of fishing to fish."

We however put it down in our mental log book as "chronicles of an unsuccessful day," (FOREST AND STREAM will please give us credit) for we had fished over fifteen or eighteen miles of good looking water without a solitary nibble, a day's experience so unusual that I was not surprised when Old Knots said that evening as we surrounded the camp-fire, "Boys, Old Hickory has forgotton how to fish; his right hand has lost its cunning, and I move we break up his rods and start him on the back track for home." KINGFISHER.

[TO BE CONTINUED.]

TIM AND SEVEN PONDS.

THE suggestion in your issue of June 12 that one may be undecided in selecting among the many advertised fishing grounds, prompts me to tell what I know about Tim Pond and Seven Ponds, having just returned from that locality, where I spent two weeks. I wanted trout fishing, and though I fully appreciate the satisfaction of taking and showing a seven-pound Rangeley trout, I did not want him this year. I wanted fly-fishing, and got it to a degree far exceeding all promises or my own anticipation. And I am fully convinced that this locality is the best in this country for my sport.

The region of the Dead River is yet in its infancy, and I would feel like wishing it kept a secret, but believe that under the influence of the present degree of intelligence of the people, the popularity of fish protection and observance of judicious laws, that it will not, like Rangeley, ever become so depleted as to require restocking.

You will here find all and more than is promised by Kennedy Smith, who has done so much to make these ponds accessible. The buckboard roads through the forest have been cleared of all obstructions since the gale of last year; and as evidence of their condition, I will say I made the distance of thirteen miles between camps on foot, with my pack, in four and a quarter hours, and had my morning and evening fishing.

The water of the ponds is as clear as a mountain spring. The trout rise to the fly in all the waters, and in all my experience I never saw their equal in fighting qualities. They take the fly with a leap clear of the surface and contest their final capture like a black bass. I need not tell any angler that such a trout is fat and solid, and when served on the table opens red as a salmon and is the finest fish in the world.

The camps are built to accommodate parties of from two to ten, are made convenient and comfortable with stoves and mosquito nettings, so one can rest undisturbed till late in the morning or rise at 4 A. M. and land twenty-five pounds of trout before breakfast. The table is served with sufficient variety and the food well cooked. The scenery and surroundings are peculiar and enchanting. Sitting in your boat on one pond you can count forty-two cone-shaped peaks of hills and mountains around you, which are covered to the summit with a dense dark growth of spruce, sprinkled and dotted with the bright leaves of the birch, the two contrasting colors producing an effect seldom surpassed in nature or art. I was more than satisfied with my whole trip and its results, and crave pardon if I am too enthusiastic over Tim Pond and Seven Ponds. M.

BROMFIELD House, Boston, June 16.

FISHING IN TEXAS WATERS.

SOME two years ago my brother, stationed at Colorado, Mitchell county, Tex.—at that time the terminal station of the Texas Pacific Railroad—wrote for me to make him a visit, and, knowing my fondness for fishing, he advised me to bring my tackle with me, as all the streams in his vicinity were full of fish. I landed in Colorado City, as it was then called, on the first passenger train ever run into the town. The car of Major Stocking, the terminal agent of the railroad, and that of his genial, jovial cashier, Charlie Harris, made part of our train. They were leaving Abeline to make Colorado their headquarters. The ride from Abeline was a long and tedious one, owing to the many construction trains, loaded with material for the railroad, on the track and on nearly all the side tracks. I was invited into the cashier's car, and then the time passed more quickly and decidedly more pleasantly, as my kind host was well fixed. He had a good bed, soft chairs, a piano and guitar, and was no mean performer and singer. Add to the above plenty of cigars and tobacco, and I know you will say this was good enough even for a fisherman.

After a day well spent in witnessing the rapid extension of the railroad toward El Paso, we formed a small party to try the fishing in Morgan Creek, some six miles to the south, and on the west side of the Colorado River, into which it ran. We had a pleasant ride over a fine rolling prairie, covered with good grass and small mesquite trees. Our guns were popping away at jack rabbits, quail, and cunning little prairie dogs which remained just a second in sight, and then with an elevation and quivering of their tails, descended into their holes. As we neared Morgan Creek, I descended from the wagon to find a good place to try our luck, and came upon a most inviting spot, a pool, apparently six or eight feet deep, and extending some three hundred feet up and down the stream. I quickly had a line out, and baiting a good-sized bass hook with some bird entrails, I made a cast. My line had just straightened out when my cork was under in vigorous style, and when I gave the pull I found I had hooked a good-sized fish of some kind. Up and down the pool he rushed. I let him have plenty of line, then would reel in till he was off again. You may imagine the excitement and delight of the party. They were soon at my side. When my fish was tired out, I reeled him to the bank, a cotton hook was used in place of a landing net, and my catch proved to be a four-pound blue cat.

Now all was excitement. Every line in the party was soon at work, and all were kept busy. Dinner was eaten very hurriedly and we went back to our lines again. Our catch was about one hundred pounds of cat, buffalo, and some few drum. All anglers who have fished in southern streams are familiar with this fish. It bites quickly and greedily, is easily hooked, and soon tired out and brought to hand. On our return, I was telling Mr. Coleman (lately of your street department) about seeing beaver dams on this little creek, and all the trees around barked by them. He insisted I was mistaken, as he thought it too far south for beaver. Who was right?

We were all so much pleased with our success, and enjoyed the fishing, the shooting and the ride so much that two days afterward Charlie Harris organized a party for another trip; this time our objective point was Champlain Creek, some nine miles south of Colorado, and emptying into the Colorado River on the east. After a charming ride, similar in every respect to the first, we reached Champlain Creek near the ranch of Mr. West. As it was near night we selected a place for camp a few hundred yards below this ranch. We sent our driver up to the house to see what he could buy for our table, and upon his return we found the traditional story of "no milk or butter in Texas" was not true, as he brought us a bucket of good rich milk, one of buttermilk, and three pounds of sweet, well-made butter. This was a rich treat for us, and with some topknot quail killed on the road, made us a royal supper. For once in camp, I saw coffee at a discount. While our cook was getting supper for us, I had commenced fishing, expecting the fish to bite as freely as in Morgan Creek, but to the great surprise of all, we did not get a nibble, so leaving our lines set we went to supper. Returning to my line after supper I found I had made a catch, and drawing in, found I had an eel about a yard long. From then till bed time, our party caught seven eels but not a bite from anything else.

We were up early the next morning to find plenty of cream on our milk—I made a cream punch, which all pronounced ambrosial. After a good breakfast, we began to fish in earnest, using liver and bird entrails for bait. We tried every pool down the creek to its junction with the Colorado, but not a bite rewarded our efforts. We found the stream similiar to Morgan Creek, full of deep pools, varying in depth and length, and having the appearance of good fishing places. We heard afterward that some pothunters had been using dynamite there.

Just before reaching the mouth of the stream and in sight of the Colorado River, I witnessed a battle royal between two large hawks. They were on a sandbar, fighting away, all covered with blood and dirt, and looked as if they might have been at it for some time. Our approach did not frighten them in the least, and they kept on striking and clawing each other until we shot them. I never saw so game a battle.

We were now on the banks of the Colorado River, where Mr. E. found a deep pool, at the side of which were two large sandstone boulders, one perpendicular and one horizontal, resembling the back and seat of a chair. The bottom one was about ten feet square on top, and from this we had fine fishing, the cat biting as freely and greedily as they did in Morgan Creek. We were greatly annoyed by the detestable garfish—they would seize our bait, but a few flops and the hook was out of their hard, miserable bills. About 4 o'clock we came to a deep pool, with sandstone boulders at each end and a hard sandy bottom, where we all enjoyed a fine salt bath. I neglected to say in our preparations for this trip we had to take with us a keg of water, as the waters in Champlain Creek and in the Colorado River are so salty we could not use them.

We now had our 100 pounds of catfish, ranging in size from one to four pounds, and a few eels. On our return we got a shot at some antelope, but they were too far off. Shortly after, I saw a young rabbitt dancing around on his hind legs in a circle, and when I spoke of it Charley H. at once said it was being charmed by a snake, and so we found it as we drove up. A shot from our Winchester cut the snake in two, when the rabbit sank to the ground, exhausted. We found it half covered with slime, as if the snake had been preparing for his meal.

I may be wrong in calling the birds spoken of above quail; they were exactly like our Bob White, only larger, and all had the "topknot." I read in the FOREST AND STREAM of Jan. 31 an article headed "California Quail in Confinement," which spoke of a pair sent to Texas from New Mexico. Now, if they are the same, I saw hundreds of them in Mitchell county, Texas.

At this, the close of my letter, I wish to give my testimony to the kindness I received everywhere in Texas. The passengers on the train, from Dallas out and return, would compare favorably with the people met on any train from Maine to California, and the much-abused cowboy I found kind and ready to help us. A heavy blanket, forced on me by one of them at Colorado City, added much to my comfort on our little excursion to Champlain Creek. JAY.

[There are several species of topknotted quail in Western Texas. The Gamble's partridge is perhaps the one referred to by our correspondent. This resembles in most respects the California valley quail, having the club-shaped, forward-directed plumes. The Massena quail and the scaled partridge have a full crest more like Bob White's.]

TROUT IN MAINE.

THE Maine trout fishing season is proving one of the most satisfactory for many years. All reasonable sportsmen are returning satisfied with their success. This may be explained in two ways. A strong sentiment in favor of saving the game fish, instead of wasting them, is opening the eyes of all true sportsmen and leading them to be satisfied with moderate catches—enough for the table while in camp—while the Maine law has effectually stopped much of the transportation, and hence the desire to fish for the market or to send home. On the other hand, the fishing in the Sebago waters, the Androscoggin lakes and Moosehead has proved unusually good. A gentleman who has visited the Androscoggin lakes every spring for twelve years, and is well acquainted with guides and the sportsmen who usually visit these waters, has just returned from a nine-days' trip to Richardson Lake, and feels compelled to consider it one of the most pleasing he has ever made. Parties are returning daily from Moosehead highly pleased with their success. They report trout enough, but their enough is less than formerly. They are learning to appreciate the woods, the mountains, the forests and camp life more than ever, and to be satisfied with trout enough to eat.

But for some reason unexplainable, unless the good work of restocking and the benefits of protection are being felt, the number of fish taken thus far from the Maine waters is greater than ever, and the size is certainly larger. Some remarkable trout have been taken from the Androscoggin waters. The catches from Oquonoc and Mooselucmaguntic lakes have been remarkable for size of trout, some of which have already been noted in the FOREST AND STREAM. But lately comes Richardson Lake to the front, with a perfect sample of the male *Salmo fontinalis*, or brook trout, weighing nine and one-half pounds. This noble trout was caught last Wednesday from the upper end of that lake and immediately brought to Boston, where it was displayed in Appleton & Litchfield's window on Washington street. It drew a crowd of admirers and is probably the largest specimen of the charr on actual record, with the exception of the great fish taken from Mooselucmaguntic Lake at the Upper Dam, Sept. 29, 1880, weighing eleven pounds, and now in possession of the Smithsonian Institute. Other fish are mentioned of various weights, from nine to ten pounds, but no absolute record of them is at hand. The nine-and-a-half-pound fish had the hook on the under jaw well developed for a trout in June, and the red on the sides was more like fall and the spawning season than the spring.

Among the other remarkable catches this spring may be mentioned the landing from one cast four trout—one for each fly. The trout were not large, to be sure, but probably weighed over four pounds. Mr. Stewart, of New York, is reported to have landed at the Upper Dam two trout at one cast, the united weight of which was sixteen pounds. This same Mr. Stewart went into the lakes as soon as the ice cleared, and was to stay till about June 20. His skilled rod has supplied many an unlucky fisherman with a handsome trout or two, while the tables of the most of the hotels and camps in the vicinity can testify to his bounty and skill as an angler.

What the late fishing may be is a question. At the Androscoggins the case is doubtful. At the Upper Dam, which controls a flowage twelve feet on Mooselucmaguntic, the work of drawing off the water, preparatory to rebuilding the entire woodwork of the dam, has begun. The lake will be drawn down to the lowest possible limit, and probably remain so till early winter, since the work of rebuilding cannot possibly be completed in season for any rains which would fill the vast expanse of lake before the late fall.

Some anglers of long experience in this vicinity believe that great numbers of trout will be driven into Trout Cove, and that the fishing there will be excellent. But the danger is far greater that the flowage will not be put on again till after the spawning beds are established in what then is running water at the mouth of the in-running streams, and that the flowage then coming on will destroy a vast amount of trout in embryo. It is a great pity that any manufacturing interest should have the damaging of the best trouting grounds in the world at its disposal. Richardson Lake, below the Upper Dam, will probably be kept more than usually full of water the most of the season, unless a long-continued drought should require the water to be drawn off for the factories at Lewiston.

Joseph Jefferson, the renowned actor, has had some rare sport with the landlocked salmon at his camp on Skiff Lake in New Brunswick. Travel by the Eastern and Maine Central Railroads to the fishing resorts has been excellent thus far, and with good promises for the shooting season a good year will be made. The stage and buckboard travel into the Wilderness is better arranged than ever this year, and later in the season the mountain roads are to be improved. The little steamers on Moosehead, Oquonoc and Mooselucmaguntic lakes are running regularly and promptly as ever, and the steamers on Richardson and Umbagog lakes are pleasing the public much better than for the past three seasons. SPECIAL.

BOSTON, Mass., June 16.

[It is reported that Mr. George W. Dillingham, of New York, while trout fishing at the outlet at Moosehead Lake, Me., on Wednesday last, had the remarkable luck to strike four trout at one cast, whose united weight was ten pounds, and was so fortunate as to succeed in landing them all. There were with him at the time as witnesses of his wonderful feat Messrs. P. O. Vickery of Augusta, Me.; R. L. Keach of Providence, R. I., and G. J. Geer, Jr., of New York city.]

THE NEWFOUNDLAND CODFISHERY.

ITS EARLY HISTORY IN NORTH AMERICA.

THE first result, and the chief result of the discovery of North America and Newfoundland by John Cabot, in 1497, was the immediate establishment by Europeans, of a great fishery around Newfoundland and the shores of the Gulf of St. Lawrence. England claimed the northern portion of the American Continent by virtue of this discovery, but strange to say, England made no use of the illustrious achievement; for half a century she sent no fishing fleet to North America. Hardy French sailors, Normans and Bretons, were the first Grand Bank fishery; in poor, frail little fishing craft, not half the size of a New York pilot-boat, these bold, adventurous toilers of the sea, dared all the perils of the great unknown ocean of the west. At first they came alone to face the fog banks and the icebergs of Newfoundland in quest of cod; but as early as 1504, we have an authentic account of their fishing expeditions to the New World; a few years later they were joined by the Portuguese and by the Northern Spaniards from the Basque Provinces. The manner in which these foreign fishermen took possession of the Newfoundland fishery, is a curious episode in our North American history; not only were they the first to catch codfish on our coasts, but they were the first whalers and seal killers, and more than a couple of centuries later, when England began the northern whale fishery, Spaniards had to be taken on their first trip to teach English seamen how to kill whales.

The explanation of these remarkable events in the history of commerce is not far to seek. It seems difficult for us now to imagine England with almost no commerce, and to think of a day when Englishmen were not sailors, but four centuries ago this was the true condition of our great mother country. In the reign of the seventh Henry and for a hundred years afterward, she was only slowly following her foreign competitors in the great Transatlantic codfishery. It was the pursuit of cod in Newfoundland that first drew English mariners from their narrow seas, and tempted them to brave the dangers of the Atlantic; and England's maritime power and the vast commerce of our race, whose ships now whiten every sea, had its birth and its real commencement in the Newfoundland fishery. Lest many of my readers should doubt this statement, I will quote from the records. In the reign of Henry VII. we have an account of only two voyages made to North America by English vessels. In the reign of his successor, the virtuous King Hal, we have only one, and as late as 1578 Antoine Parkhurst, a merchant of Bristol, thus writes of Newfoundland: "There were generally more than 100 sail of Spaniards taking cod, and from 20 to 30 killing whales; 50 sail of Portuguese, 150 sail of French and Bretons, mostly very small, but of the English only 50 sail. Nevertheless," he adds, "the Englishmen are commonly lords of the harbors where they fish and use all strangers' help in fishing, if need require according to an old custom of the country; which thing they do willingly, so that you take nothing from them more than a boat or two of salt in respect of your protection of them against rovers or other violent intruders, who do often put them from good harbors."

The question will naturally present itself, why did these Spaniards, Portuguese and Frenchmen leave the gold fields of Peru and all the riches of the southern part of the continent for the stormy north, with its fogs and icebergs? Some great attraction must have drawn these southern Europeans to Newfoundland. That attraction was fish, and in these North American fisheries they found a perfect El Dorado, more productive to them than the diamonds of Golconda, or all the fabled gold of the New World. To appreciate how great was this mine of wealth to them, we must strive to comprehend the state of the food supply of Europe in that age. Two great staples of modern agriculture did not exist, there were neither potatoes, turnips, nor many of the vegetables now in common use; tea and coffee were unknown; all the winter through fresh meat was almost unknown in England, fresh fish was uncommon; the monks and the wealthier classes had their fish ponds, and the very wealthy had game, but for the general population, salted meat and salted fish were the great staple food, and the latter was neither plentiful nor cheap. Imagine then, if you can, the effect on medieval Europe of this marvellous discovery of an unlimited supply of the finest fish food in the world. As a salted and dried fish, cod is *par excellence* the king of all fishes. When properly watered and properly cooked, the salted and dried codfish of Newfoundland is quite as good, if not better, than the fresh fish. In a warm country where meat will not keep a day, how great is the value of an article of delicious, relishing food that will keep any time, and only needs steeping in water and proper cooking to make it into a most palatable dish. Among the Spaniards, Portuguese, Brazilians and Italians "bacalao" (or dried salt codfish) has for the last 400 years been a favorite article of food. One reason is that they thoroughly understand how to cook it, which Englishmen generally do not. Spain alone consumes about one million quintals of codfish.

Great wealth was gathered by the Spaniards, especially in this fishery, and to this day the grand old mansions scattered about the Basque provinces, the Carlist country in Spain, attest the great proceeds of the whaling and fishing carried on by these ancient fishermen on the banks and shores of Newfoundland and the Gulf of St. Lawrence.

In another paper I will endeavor to describe the manner in which these ancient mariners carried on their transatlantic fishery. Their fleet was a large one, and Spaniards, Portuguese and Frenchmen extended their operations from Newfoundland to New England, fishing there more than a hundred years before the landing of the Pilgrim Fathers.

ST. JOHNS, Newfoundland. D. W. PROWSE.

THE CANADIAN SEA TROUT.

PROFESSOR JORDAN, in an interesting paper in FOREST AND STREAM, June 12, admits "that it may be best to recognize the above fish as a distinct sub-species, as we do the landlocked salmon."

Anglers have, I think, always done so, although naturalists have not. If, as I understand, Professor Jordan is an angler, the concession may be due to that fact. Perhaps he may have killed the Canadian fish on his own rod, and may have noticed its coloration and habits, so different from those of the brook trout, and may have tasted its superior flavor on the table. I notice that he gives it the name *Salvelinus fontinalis immaculatus*—"the unspotted trout," a name which, I think, was first used by Professor Storer, of Boston, on a specimen from Labrador.

Now the Canadian sea trout, so abundant in the tidal waters and rivers of the Dominion, is a red-spotted fish, much more silvery and brilliant of hue than the brook trout taken in the same waters. So obvious is this difference, that all the guides and local anglers of those waters will point it out at once. The fish vary in size in different rivers. Thus in the Restigouche, a large river, I have found them in company with brook trout averaging in size about six ounces.

In the Tabusintac, one of the most famous trout streams of New Brunswick, but a small river, I found the sea trout very abundant, with a few brook trout, the average size of the former about ten ounces. A lot of fifty, which I captured there in about four hours, weighed thirty pounds.

In the Nouvelle, a beautiful river on the north shore of the Bay of Chaleurs, P. Q., my string of trout, fifteen in number, averaged two and a half pounds. Few, but large, and no brook trout in the stream; all sea trout, almost as silvery as salmon.

In Wilkie's River, Prince Edward's Island, sea trout and brook trout were found together, about three to the pound. In these waters the fly alone was used, and in the Nouvelle the large trout were taken with the same flies which I had used for salmon the week before. In this river, which is very swift, icy cold, and clear as crystal, the trout lay in pools like salmon, and were to be found nowhere else. My Indian guides before coming to a pool would go ashore and climb the high bank to look for the fish, which they could easily see in the clear water, then they would place the canoe near the pool for me to cast from. The trout took the fly under water, like the salmon, and their play was much like that of a grilse or young salmon of three pounds weight. Any one who has killed a grilse will appreciate this praise.

I have never taken this fish in salt water, and, therefore, cannot say anything about the sea trout described by Herbert, Perley, and others, as coming into the river mouths with the tide in great schools, like mackerel. I have only met with them in fresh water, and these certainly appear to differ more from brook trout than do the large and small-mouth black bass from each other.

This Canadian fish seems to be a most loyal subject of Victoria, always keeping within her dominions, and never, as far as I know, straying, like its fellow subjects, into the richer pastures of Yankee land.

I could wish that some angler-naturalist might do for the sea trout what Dr Henshall has done for the black bass, and settle the vexed questions of identity and nomenclature.

MARIETTA, Ga. S. C. C.

ENGLISH TROUT FOR AMERICAN STREAMS.—Paterson, N. J.—It is a deplorable fact that our brook trout is fast disappearing from the numerous streams where he once was plentiful. This would not have been the case if the streams were properly protected by taking care not to cut down the trees which shelter from the fierce rays of the sun the springs flowing into the brooks. In the spring such streams become torrents, and in the summer are almost stagnated water. In some of them not a drop of water can be found. No trees in the near vicinity of a stream ought to be cut down. A great deal of money has been expended on restocking our streams, but without very satisfactory results, because our trout require cold spring water and will thrive in no other. The best trout for restocking our streams, I think, would be the English trout; they thrive in almost any slow running water, and I have caught some splendid ones in a sluggish canal. The trout of Great Britain grow rapidly, are a beautiful fish, and I think they possess more gameness than our trout. As a table fish he is excellent. I think that if this fish were placed in our streams he would do as well here as in England, and in a few years we would have splendid fishing for him.—PASSAIC.

MICHIGAN FISHING.—The grayling fishing this season is said to be better than for several years. I have heard direct from the Ausable River as well as several other streams containing the dainty beauties, and all reports coincide as to the fishing being above the average. Mr. E. S. Baker, of Detroit, has just returned from a two weeks' trouting trip to the Jordan River. During the expedition he had most excellent sport, landing in all over one thousand brook trout. The fish do not run very large in the Jordan. The largest caught by Mr. Baker weighed one pound, while the average of his catch was about six ounces. But their numbers make up in part for their lack of size, for he caught in seven hours' fishing over one hundred of the toothsome fishes. Black bass are being taken in small numbers from the Detroit River. The best catch I have heard of in the vicinity of Detroit was that made by Mr. H. B. Bromley, who with his brother landed nine bass the other day. They also caught the same day thirty-six pickerel averaging in weight from two and a half to three pounds each. These were caught near Belle Isle, and such sport to be had at home and inside three or four hours' time taken from business makes me think that Detroit is a good place for an angler to live in.—DELTA.

MICHIGAN CAMP GROUND.—The finest bass and pickerel I ever saw and the most of them were at Hubbard Lake, Mich., last fall. Also deer and ruffed grouse in season. Go to Alpena by boat, thence down to Ossineke by daily steamer (fare fifty cents), then by "tote road," nine miles to the lake. It is right in the pine woods. Take tent along. Fine camping ground. I don't tell "fish stories," but if the fishing there does not satisfy any lover of the sport, he must have "an awful appetite for fishing."—PEDAGOG.

OQUOSSOC ASSOCIATION.—Officers of Oquossoc Angling Association were elected as follows in camp, June 4: President, Weston Lewis, Boston; Vice-President, Senator Francis Fessendan, Portland, Me.; Clerk, Galen C. Moses, Bath, Me.; Treasurer, James A. Williamson, New York. Mr. Carpenter, of Providence, R. I., was elected Trustee in place of Mr. Lockwood, deceased. Other trustees were elected.

WEST VIRGINIA FISHING GROUNDS.—Mt. Pleasant, Pa., June 16.—I spent a month lately on the trout streams of West Virginia. One can find excellent sport there. Unfortunately for me I was too early. The Upper Cheat contains many trout, and I've taken some of good size, say from fourteen to sixteen inches, that's a good trout with us. If one should go to Cheat, Black Water or Greenbrier after a little while he could have rare sport. I take the Baltimore & Ohio Railroad to Oakland, Md., thence 28, 35 or 42 miles cross country to Cheat. Conveyance can be had at reasonable rates. Go well prepared to wait on yourself. I found the habitations of man scarce. The greatest event of my trip was the taking of a pike in the Middle Island, a small stream flowing into the Ohio, just above Parkersburg. The water was very clear; bait, a white sucker about eight inches long; tackle, pike hook and staging, and common chalk line; time of battle, twenty-two minutes. This magnificent fellow measured forty-two and a half inches, and weighed nineteen pounds. I have the head and tail of this monster in a good state of preservation.—FARMER.

SHAD IN THE CONNECTICUT.—Holyoke, Mass., June 23.—The prayers of the wicked availeth little—for between the wickedness of the Holyoke anglers, and the horde of cowboys who are running the net at South Hadley Falls, and probably a few sins laying on the Fish Commissioner's door steps, few shad have put in an appearance, eight shad only being taken with the hook, and not many more with the net. Several hauls of the net this morning did not show a scale. The flow of water in the river this spring, up to this mouth, has been the best for many years, yet the shad don't come. If the saying, "as good fish in the sea as were ever caught" is true, can't "you uns down thare" suggest to some of the fish tribes that there would be room and a welcome for them up here, or are all the fish put on the Chinaman's ticket; excluded and forbidden to enter the Connecticut River, on pain of a lingering death by poison?—THOMAS CHALMERS.

THE WINDFISH.—Sing Sing, N. Y., June 23.—In a late number of the FOREST AND STREAM inquiry is made as to the proper name of the windfish, which inhabits the streams of the lower Hudson valley. The fish which is usually known by that name in this vicinity is *Uliola hudsonia* (Clinton) J. & G. It is also known by the name of "river bass." In some of the large streams, as the Croton River for example, it grows to the length of twelve to sixteen inches, and affords considerable sport to anglers.—A. K. FISHER, M. D. [The *C. hudsonia* does not grow to a size to attract the attention of anglers. It is seldom above a finger in length, and is known as "spawn-eater" at Albany. We suspected the fish mentioned by "N." in our issue of June 5, and by "Niagara," June 19, to be the big chub, dace or fall fish, *Semotilus bullaris*, (Raf.) Jor., but the description was too meagre to decide. The size alone determined our guess.]

SALMON AND TROUT IN CANADA.—Montreal, June 16.—Some large catches of trout have been made recently north of here in the Laurentian waters. Reports of good sport from the eastern township waters are daily received. Campbellton, N. B, June 20.—Salmon fishing here so far this season has proved a total failure, as not more than three or four have been taken in the Restigouche and Matepedia rivers, and but a very few fish are taken in the nets below tidewater in Bay Chaleur. Trout fishing is also poor, but a few good catches are reported. The writer and a friend will to-morrow start for some small lakes back in the interior, and will at a later date report success or failure.—STANSTEAD.

RICE LAKE FISHING.—Harwood, Rice Lake, Ontario, June 17.—The prospects for summer duck shooting are good. A great many wood and black ducks are hatching here this season. The maskinonge fishing is good and has been since the season opened, May 24. Large quantities have been caught by the Indians and whites trolling. Black bass fishing commences about the middle of July. I see by your issue of June 5 that "W. C. M." wishes to find a place where good bass fishing and partridge shooting can be had in August and September. He can get both here. Abundance of partridges on the islands and main land. Partridge season commences Sept. 1.—CHAS. GILCHRIST.

THE MARYLAND COAT OF ARMS.—Maryland is a paradise of anglers. The State motto is *Crescite et multiplicamini*, increase and multiply, and the coat of arms consists of a man who holds a spade with which he has been digging worms, and an individual on the right who has just returned from a fishing trip with a string of fish. He is evidently telling the other fisherman that he was only fishing half an hour and that he caught a lot, but having a very small family threw the biggest fish back into the stream.—*Newark (N. J.) Sunday Call.*

BLACK BASS IN CONNECTICUT.—A friend and myself recently made a trip on the Hartford and Connecticut Western R. R., in search of reported black bass. At Copake Lake we found good fishing near the Beach House, and took many good fish. From there we went to Ancram and found fair sport on the upper and lower Rhoda, Long Lake, Snyder and Miller lakes, all of which are within easy reach from either Copake or Ancram.—POKE O-MOONSHINE.

BLACK BASS IN OTSEGO LAKE.—Some years ago black bass were put in Otsego Lake, near Cooperstown, N. Y., but there have been no results from them until in the present month. Two small boys lately took over twenty fish which would average two pounds each, in a small stream at the head of the lake.

ST. CLAIR FLATS.—Star Island House, June 21.—Bass fishing has just commenced; Mr. Charles Miller, of Chicago, made a fine catch of 109 in four days. Mr. James Slocum, of the Star Island House, has made quite extensive improvements since last year, adding thirty-five large sleeping rooms and a dining room with a capacity for 250 people.

LARGE TAUTOG.—A large tautog, or blackfish (*Tautoga onitis*) was caught in Long Island Sound, at Little Captain Island, off Greenwich, by Mr. P. Scutt, of Riverside, which weighed 10¼ pounds. We believe that the largest one on record weighed 13 pounds.

SEVENTEEN THOUSAND MEN in 1883 were paid cash benefits under accident policies in the Travelers of Hartford, or $4 for every working day.—*Adv.*

Fisciculture.

PROTECTION OF THE OCEAN FISHERIES.

[A paper read before the American Fisheultural Association.]

BY E. G. BLACKFORD.

ONE of the questions that frequently perplexes the mind of the fisheulturist and the legislator is, how to protect in the best manner the valuable food fisheries of the sea coast and ocean.

On the one hand, there are the market fishermen, who use sailing vessels, and work either in the deep outside waters, or with net and hook, gather their prey along the shores and in the bays of our coast. This industry gives employment to over 85,000 men, and a capital of over $30,000,000.

On the other hand, we have the large fleet of steamers that patrol the ocean catching the menhaden, and from them manufacture oil and fertilizers. An occupation involving nearly $3,000,000 and giving employment to over 2,000 men. These facts give some idea of the magnitude of the interests involved and of the importance of the question under discussion.

For the last five years a large number of the former class of fishermen have claimed that the steamers seriously affected their business, stating that many kinds of fish that were formerly abundant, are now scarce, and that, unless laws are passed, prohibiting the menhaden steamers from fishing within three miles of the shore, or in some way restricting their operations, many kinds of the valuable fishes will be exterminated or driven from our shores. In pursuance of this idea, they have petitioned both State and National Legislatures to that effect.

The question has been largely discussed by the press, the State and National Fish Commissions, and in the United States Senate. The latter has appointed a Committee on Fisheries, with Hon. E. G. Lapham as chairman. This committee has for the past two years taken the testimony of all classes of fishermen, and obtained the views and theories of fisheulturists and ichthyologists. And, in addition to this, we have the valuable information and statistics gathered with great care by Prof. S. F. Baird, the eminent Commissioner of Fish and Fisheries of the United States.

It has been my privilege to assist in obtaining information on the subject for the Senate Committee, the United States Fish Commission and the New York State Fishery Commission, and I have read with great interest all of the evidence that has been taken by them bearing on this subject. And now, in discussing the question as to the advisability of any legislation to protect the ocean or sea fisheries, it is best to look over the facts which have thus far been brought out and see what would be the best way to provide for the continuance of the abundant supply that we now enjoy.

The first thing that we want to ascertain is whether what we know as salt-water fish, are scarcer now than in former times, and I would say here, that the absence of statistics covering any considerable space of time, makes an answer to this question somewhat difficult, but, thanks to the New York Fishmongers Association, and to the Boston Fish Bureau, a beginning has been made to supply this hiatus, and it is hoped that the National Government will very soon take definite measures for the purpose of getting, annually, correct statistics of the amount of fish caught in the waters and on the coast of the United States. Having been a dealer in fresh fish in Fulton Market, New York, for the past seventeen years, I have had the opportunity of noticing during this period, the varying supply of various kinds of fish, and I beg leave to submit my views as to the scarcity or plentifulness of some of these various species.

First and most important of all our fishes is the cod. I believe that there has been no considerable diminution in quantity in the last decade, judging from the quantity brought to market and the prices obtained; and as some indication of the range of price, I may say that during the year 1883 cod sold as low as one dollar per hundred weight. In some years there has been a perceptible decrease in the catch, but it has been followed by such enormous catches that the markets have been glutted. The statistics of the Boston Fish Bureau show the catch of the New England fleet to be: for 1881, 775,027 quintals; for 1882, 898,904 quintals; for 1883, 1,061,698 quintals, showing an absolute increase in two years of nearly 300,000 quintals. Surely these figures need not occasion any alarm or fear that codfish cakes will be beyond the reach of the most impecunious fisheulturist.

Next, and hardly second in importance, is the bluefish. It is a matter of historical record that these fish disappeared entirely from our coast in the year 1764, and did not make their appearance again for several years, and then they were taken in vast numbers. Suppose such a disappearance should take place this summer. How quickly the fishermen would appeal to the Legislatures to abolish the menhaden steamers, and the angler would cry out for the destruction of the pound and trap nets. Each would probably claim that the scarcity was owing to these instrumentalities. This one instance of the bluefish in 1764 should lead us to be careful and conservative in regard to legislation, and to carefully consider whether there are not some great natural laws that determine the appearance and disappearance of fish on our coast, rather than attribute it to the comparatively puny efforts of man to affect the supply.

But let us turn to the question as to their present apparent scarcity or plentifulness. During the year 1882 bluefish were scarcer than they had been for some years, and the wholesale price did not go below five cents. This scarcity was particularly noticeable on the New Jersey coast. But, the season of 1883 was unusually productive, and bluefish sold as low as two and a half cents per pound, and, had it not been for the large quantities that were taken out of the market and stored in refrigerators for winter use, the price would have declined to one cent per pound.

It would seem to be a fair inference that the bluefish needs no protection at present.

The fresh mackerel is another important factor in the food supply of the people. It has attracted a great deal of the attention of fish economists, and it is one of the fishes in regard to which, through the statistics of the Boston Fish Bureau, we can speak somewhat intelligently.

In 1825 the New England catch was 260,000 bbls.; in 1826, 160,000 bbls.; in 1827, 200,000 bbls.; in 1828, 240,000 bbls., and in 1831 the largest quantity on record was taken, amounting to 330,000 bbls. After this wonderful catch the number steadily declined, until the year 1840, during which season only 55,000 bbls. were taken. In 1851 there was another wonderful catch of 330,000 bbls.; in 1859, only 100,000 bbls.; in 1863, 310,000 bbls.; in 1868, 180,000 bbls.; in 1870, 320,000 bbls.; 1877, 110,000 bbls.; in 1880, 245,000 bbls.; in 1881 and 1882 the number is the same—260,000 bbls.; 1883, 160,000 bbls. These figures, covering a period of fifty-eight years, would seem to indicate that their plentifulness or scarcity is not governed materially by the purse seines of the Gloucester fleet.

In my own experience in the New York markets I have seen just such fluctuations in the quantity brought to that city, and whenever there occurs a bad season the fishermen and others interested talk of the probability of the mackerel being all caught up, and of the necessity of some protection for the mackerel fisheries.

The opening of the present season has been a remarkable one. The first vessel arrived March 24, and the mackerel were so small that the captain refused to take off his hatches to show the fish, and insisted upon selling them "unsight unseen," and he was fortunate enough to find a purchaser on those terms, at two and a half cents each. There were something like 100,000 fish in the load, and they were so small that it took five of them to weigh a pond. The firm that bought them

succeeded in selling a few hundred at four cents each, and then the price rapidly declined, until the larger portion of the cargo was sold at 50 cents per 100. About that time the unfortunate buyer called my attention to the fact that it was a great shame that such small mackerel were caught, and that Congress ought to pass a law to prohibit such a wicked waste.

The first load of mackerel was followed by several loads, with fish a very little larger in size, but about the 20th of April a new school made its appearance, the average weight of the fish being about one pound each, and at least 1,500,000 of this size have, up to the present time, been marketed, and a large portion of them have been sold as low as two cents each.

The porgy, or, as it is sometimes called, the scup, is another important fish that furnishes abundant and cheap food, and about which considerable controversy has been had during the past few years between the net men on one side and the hook and line men on the other, the latter claiming that the pounds and traps of the former were exterminating these fish, and efforts were put forth to have laws enacted that should restrict or abolish pound and trap fishing. But nothing came of such endeavors. This was in 1871, and fishing has been carried on in the same manner ever since, and in the New York market last week porgies sold as low as 75 cents per barrel, or about one-half a cent per pound.

I might continue on through the list of food fishes, and occupy your time and, possibly, your attention, but I think I have said enough on this branch of the question.

Now, let us consider the menhaden fisheries, against which is brought the charge that they are prosecuted to such an extent, by both sail and steam vessels, that they have materially decreased the numbers of menhaden, and seriously impaired the catch of food fishes. You will find, by referring to the reports of the United States Menhaden Oil & Guano Association, that in 1875, with 283 sailing vessels, and 25 steamers, 492,878,000 fish were taken, that in 1881, with 286 sailing vessels, and 73 steamers, 454,192,000 fish were caught, and in 1882, with 83 steamers, and 212 sailing, only 346,638,000 were caught, and last year, 1883, with 136 sailing, and 69 steamers, there was the enormous catch of 613,461,000 fish. These figures, taken in connection with the statements that have been made to me by captains of merchant vessels and fishing smacks, that during the fall of 1883 they sailed through miles of menhaden, would warrant the belief that this fish is very far from being exterminated, and that, with them as with the food fishes that are taken for market, there are seasons of great abundance, and seasons of scarity, and that up to the present time, these seasons have not been affected, either one way or the other, by human agency.

Another significant fact is, that during the early part of the menhaden season of 1883, and up to nearly its close, the fishing was so poor and unprofitable, that the fishermen themselves began to think they had "killed the goose that laid the golden egg," when all at once the fish appeared in countless numbers, and in a few days they had taken enough to turn, what had promised to be a most disastrous season, into one of large profit to all concerned.

Now, having presented these facts to you in a crude and disjointed form, permit me to say in closing, that although what are known as the hook and line fishermen, almost without exception, testify (and I believe truly) that they find their occupation and means of living seriously impaired, yet, from my experience and observation in the markets, I believe the facts to be that, with the exception of striped bass and lobsters, all kinds of sea food fishes are as abundant now as they were fifteen years ago, and, believing this, I am forced to the conviction that any legislation looking to the restriction of the fishing by the menhaden fishermen is unnecessary, and that any laws prohibiting pound and trap net fishing would cut off a large proportion of abundant and cheap food for the people, and nothing would be gained.

But I do hope that Congress will take some action that will provide for the collection of statistics as to the quantities of fish taken, so that in future, when questions affecting these vast industries come before them, they will then be able to frame legislation that will protect the fisheries, and not oppress the fishermen.

MR. ENDICOTT—I would like to ask Mr. Blackford to state whether in his opinion the pollution of the waters by gases and oils has a detrimental effect upon the fisheries.

MR. BLACKFORD—That is a question which, I believe, received some attention at the last meeting of the Association in the Cooper Institue, New York. On that occasion some action was taken, which looked toward a petition for legislation to prevent the pollution of the water. I think it was admitted by all that it had been a source of great detriment to the fishing in our bays and especially in the New York Harbor. I will quote from the Report of the Association for 1883, page 75.

"Mr. Benkard: I would like to bring up the subject of the pollution of our waters, which brings many of our fishcultural efforts to nought. I would respectfully offer the following:

"*Whereas*, It is the sense of this Association that the continual and increasing pollution of the waters of New York Bay from the refuse of certain factories, threatens eventually to kill or drive away all fish, shellfish and bivalves natural to said waters·

"*Therefore*, Be it resolved that this Association beg to call the immediate attention of the Fish Commissioners of the State of New York and New Jersey, also of the members of their Legislature, to this impending calamity."

I seconded that resolution and made a few remarks to the effect that a great many fish, which had formerly been abundant in the Bay, were no longer to be found there. Striped bass, and particularly lobsters, had been driven out entirely. These latter used to be taken abundantly on the Jersey flats. Shrimps, too, which were very numerous and formed food for larger fish, were almost exterminated, and what few remained were tainted with a flavor of kerosene. Oysters and clams have been killed by thousands in the vicinity of Rockaway. The water has been so polluted by the factories of Barren Island as to render a number of oyster beds, that used to be considered valuable, of no importance whatever. I think, though I am not certain, that the New Jersey Legislature has taken some action, and I am of the decided opinion that if our Association moved in the matter, legislation could be brought about which would be able to control this matter at least in our own State of New York.

THE PENNSLYVANIA COMMISSION.—On June 16, Governor Pattison appointed the following gentlemen to be Commissioners of Fisheries in place of the old board of which the first three were members: James Duffy, Marietta; Arthur Maginnis, Swiftwater; John Gay, Greensburg; A. M. Spangler, Philadelphia; August Duncan, Chambersburg; Henry Derr, Wilkesbarre.

WHAT THEY SAY OF "WOODCRAFT."

"Woodcraft" is the outer's *vade mecum* and will at once take rank as a standard authority, for it was written by "Nessmuk," a veteran who has spent fifty years in the woods. Within its covers is a mass of condensed information, which will enable even the tenderfoot to "smooth it," a term which the author would have take the place of the familiar "roughing it." The subject of overwork and recreation is briefly considered and some sensible advice given. Then the woodsman's outfit is described in detail; camps and camp-fires are explained with simple directions for making them properly; hunting and fishing are touched upon; and camp cooking, that source of so much trouble to the uninitiated, is treated at length, until the vexed question is made perfectly plain and with the simple receipts laid down one may fare sumptuously in camp. Going it alone for ten days in the wilderness forms an interesting sketch, and the book winds up with a couple of chapters on canoeing. Some canoeists may take exception to a few of the ideas advanced concerning canoes, but they will nevertheless glean some useful hints and learn to admire the man who can transport himself and his "duffle" so many miles in a ten-and-a-half-pound canoe.—*Lowell (Mass.) Courier.*

FIXTURES.

BENCH SHOWS.

Sept. 16, 17 and 18.—Collie Bench Show and Field Trials of the Ontario Collie Club, Toronto, Ont. Mr. H. J. Hill, Secretary, Toronto.

Sept. —.Bench Show of the Philadelphia Kennel Club, Mr. Benj. C. Satterthwaite, Secretary.

Oct. 8, 9, 10 and 11.—Third Annual Bench Show of the Danbury Agricultural Society, Danbury, Conn. E. S. Davis, Superintendent, Danbury, Conn.

Oct. 21, 22, 23 and 24.—Non-sporting Bench Show of the Westminster Kennel Club, Madison Square Garden, New York. Mr. Charles Lincoln, Superntendent.

A. K. R.

THE AMERICAN KENNEL REGISTER, for the registration of pedigrees, etc. (with prize lists of all shows and trials), is published every month. Entries close on the 1st. Should be in early. Entry blanks sent on receipt of stamped and addressed envelope. Registration fee (25 cents) must accompany each entry. No entries inserted unless paid in advance. Yearly subscription $1. Address "American Kennel Register," P. O. Box 2832, New York. Number of entries already printed **1319.** Volume I., bound in cloth, sent postpaid, $1.50.

POINTERS AT THE NEW YORK SHOW.

Editor Forest and Stream:

With humility and awe I have folded my hands and listened to the storm of "wordy war" that has been raging on this subject, till at last I have been impelled to have a word to say, just to keep the fun going.

First about Bang Bang. I do not quite understand the objection to the black cropping out in his get. A few years ago, Princess, a black bitch, stood at the head of the heavy weight bitches, and I have never heard or supposed that black was not a pointer color. If black, why not black and white? It surely is not impossible, nor if so, discreditable, that some of Bang Bang's ancestors may have been of that color. Is not the objection purely a matter of fancy? Mr. Wilms insinuates that the superfluous hair had been removed from Bang Bang's tail, but even if it was, I do not see how the carriage of it could have been changed. I had a capital chance to examine the dog, as he was taken down from his bench for me, and I must say that he is a very taking and handsome little dog, and that his tail is absolutely perfect in carriage, length and fineness of bone, however it may have been about the hair. I do not think that Bravo is better than or as good as Bang Bang. Bravo is a dog that I have never liked. I consider him very deficient in pointer character.

When Mr. Cornell says, however, that Bang Bang is "the most strikingly handsome pointer in America to-day," I wonder how he succeeds in blinding himself to the dog's loaded shoulders and short neck. On the same principle, I suppose, that he sees the crook in Beaufort's legs "before and behind." Mr. Cornell does not show very good judgment in calling renewed attention to his remark about Beaufort, that "his hocks are [likewise] also bent." The tautology was not the worst fault. The whole remark was either "too much to say" or a great deal too little. It is time that writers were more definite in their language and more careful to use proper technicalities in criticising dogs. Would Mr. Cornell prefer to see the dog's hindleg a straight line from the hip to the foot? A dog's hindleg, being the motive power (Mr. Tracey to the contrary notwithstanding), ought to be bent at two places. The hip and the foothold on the ground are the two fixed points; the stifle (answering to the human knee) bent forward and the hock (answering to the heel) bent back are the two angles at which the whole leg is doubled up like a zig-zag spring. The proper formation for any animal that has to gallop is—long from the hip to the stifle, long from the stifle to the hock, but short from the hock to the ground, and the hocks well bent, bringing the hindfeet under him. To say simply that a dog's hocks are bent is to praise him at a most important point. If Mr. Cornell meant that Beaufort's are bent outward, or inward (cow-hocked), why not say so? I do not suppose he meant that they were bent forward, and the only other way possible is to be, as they are, bent backward, bringing his feet forward and the leg from the hock down well under him.

As to Meteor—the exponent of blue blood and high breeding, long price and market value—how any one could put that bitch-headed brute before Beaufort I cannot understand. His head is hopeless, his loin is too much tucked up, his color is light and coarse, not the rich dark liver that Beaufort has, and he is utterly lacking in quality. He has good legs, feet and body; altogether he is a fair workmanlike dog, but miles away from champion form. Beaufort, on the contrary, though badly shown, is full of quality, and, except for a little "straddle" behind and the throatiness he gets from his sire Bow—who with Faust was held up for universal admiration as "the large pointer type" by Mr. Munson and his confrères of the St. Louis Kennel Club—he is beyond criticism as a show dog. Mr. Nixon speaks well of Beaufort's field qualities, and I wonder if a bitchy head, poor color and general plainness make Meteor a better field dog. A challenge on this point would be in order about the end of November.

Mr. Munson gets a good free advertisement by doing what Mr. Mason very carefully refrained from—criticising his own dog. Mr. Mason refused to say a word about Beaufort "for obvious reasons;" the reasons are not sufficiently obvious after all, it seems. Next time let not Mr. Mason leave any reason unexplained because it is obvious. Explain it in capitals, underlined and with three exclamation points, and perhaps it will be understood.

Mr. Munson's fiat of "mongrel" fired at Glenmark and Lily, coming at this late day, is simply amusing. Girl and Icicle I know nothing about, but Glenmark was by Rush out of Romp, Rush by Flake out of the despised Lily. Poor Lily! Why did she not peacefully turn her toes up toward the beautiful daisies without having left any unfortunate progeny to fall under the crushing weight of Mr. Munson's disapproval? In short, why did she dare to exist at all? A bitch that produced six prize winners in a single litter, and in the second and third generation, more show winners and good field dogs than I care to try and count, is a pretty good "accidental" breeder. Rush was beaten once when a pup by his sire Flake, (was he a mongrel, too?) but never since in his class. I believe that he was beaten two or three times for specials and sweepstakes by heavy weight dogs. What small pointer had any chance against Rush and Rose, and later Rush and that Queen of beauty, little Rue (out of Ruby, by Flake out of Lily)? In mercy to the younger lot, the old dog was retired to give them a chance and, though nine years old, I doubt if any small pointer on this side of the water can beat him to-day. Not knowing what they have in England, I do not want to claim absolutely that he can beat the world, but I am willing to risk a few dollars on his ability to do so. With the exception of his tail, which, though fine and short, is not carried quite straight, and a very very little more finess than I like, I think him absolutely perfect. How many there are who agree with me, his record satisfactorily proves, and I question the taste of impugning Mr. Orgill's honesty and the "straightness" of the pedigree of his strain when he and the handsome and typical dogs he has bred (not bought) and shown have taught Americans what a pointer should be.

As might be expected from so thoroughly sportsmanlike a breeder, all Mr. Orgill's dogs are field dogs, and Rush, though beaten by La Guy at the Eastern Field Trials in 1880, proved himself a game and level-headed little worker. It was thought (from the confused orders of the judges) that his turn would not be reached the first day, so, as he had had just a week's preparation, the opportunity was seized by his handler to give him a hard morning's work, and as he was called on to run that day after all, about half an hour after his well-earned dinner, he went rather stale compared to a fresh and fasting dog. He made one flush and a false point where birds had lately gone away, making out his mistake very nicely in the latter case, though he got no credit for it. Nothing could be finer than his attitude, on that point particularly, and in short, in spite of the disadvantage he was under, he proved himself a thoroughly good field dog.

We breed pointers, I believe, for work and for looks, and when Rush himself and so many of his blood have proved themselves as good as the best for both, it is natural to conclude that the breeding is all right. I will venture to say that the progeny and descendants of no one other pointer bitch on record, have been remarkable for so high an average of excellence as those dogs that, to their honor and credit, number the illustrious "mongrel" Lily among their immediate ancestry. The first pointer bitch in America to win at both bench show and field trial, dam of a dozen winners, grand dam and great-grand dam of numbers almost uncountable—if she is a mongrel and her success as a brood bitch accidental, Heaven send me a few such accidents.

GEO. D. MACDOUGALL.

NEW YORK, June 17.

Editor Forest and Stream:

For the edification of Mr. Mason and in justice to Mr. Cornell, allow me to state through your paper that my breeding Grace to Beaufort did not in the least "gall" that gentleman, for I had the honor of consulting with him about the very breeding in question, and here are his own words before I bred to Beaufort: "I would prefer Vandevort's Don on account of his breeding, but if you can't get him I would advise you to breed to Beaufort, he is a good dog, but not the handsomest pointer living by any means; I would be very sorry to let a feeling against the owner interfere with the use of a good dog. He is throaty, bad at the pasterns and crooked the wrong way behind, but Grace is old and he being a young vigorous dog, he should get something good, especially as she is particularly good where he is faulty." Those words clearly show that my breeding to Beaufort is not "galling" to Mr. Cornell, or I may add to any other member of the W. K. C., for I have given my opinion freely to several of them, and although they did not agree with me they showed no signs of "galling."

I have broken dogs for the club, but am not entitled to the honor of being called the club's breaker, for I am not the only one that breaks for the club, and I am just as independent of the club as Mr. Mason. I do entertain the highest respect and esteem for some few members of the W. K. C. whom I have the honor of knowing, and Mr. Cornell is foremost among them. I met him accidentally at the first New York show, and have very frequently met him and shot with him in the field since that time. He is a first-class field shot, an ardent lover of good dogs, and a perfect gentlemen, besides being a most excellent friend; and for those qualities alone and not because I care about breaking dogs for the club, do I hold him in the highest esteem that I am capable of. I did say, and I now repeat that Beaufort is [the best looking pointer of his size I ever saw, but if both dogs were the same age and I had my choice, I would take Sensation in preference. No matter where or what he won, he has the grandest head and neck that ever a dog possessed. I bred to him three times, got thirty-six pups and not a weed among them. Which one of them over ran at a field trial or was shown on the bench without getting noticed? If I do as well with Beaufort's get I will be happy.

Much as I admire Beaufort, I am not so blind but I can see some foundation for Mr. Cornell's criticism of him, and if those people who have lately made insinuations against Mr. Cornell will use reason, they will see that a person arguing a point will always give as much force to his words as possible, and while Beaufort is not a deformed cripple, but a grand dog, he does toe in, is throaty, and stands so wide behind that a person might say he was extremely crooked, and still be a good judge of dogs and an honorable man. Mr. Mason does injure the looks of his magnificent dog by dragging and lifting on the chain and trying to improve upon nature.

In justice to Mr. Cornell, I would here state (and perhaps you will remember the occurrence, Mr. Editor) that the same criticism of Beaufort, given through your paper, by him lately, was made to me at the New York show of 1882. I talked of buying Beaufort for a friend, and knowing that Mr. Cornell had a knowledge of the dog which I had only heard of, I asked his opinion, and here is his reply: "A fine dog, but is bad at the pasterns. Very throaty and bent the wrong way behind. I would not think of giving over three hundred dollars ($300) for him." Those words were spoken by Mr. Cornell to me long before Mr. Mason owned the dog, and will show clearly that Mr. C.'s opinion has not been changed on account of any feeling that may have since sprung up between them.

I would respectfully ask Mr. Mason or some one else who has used the term "type" so much lately, to define the meaning of the word as applied to pointers. I only know of two distinct types of pointers, viz.: the Spanish and English. A dog may differ a little in form from another of the same type. With propriety, I think, a long back is just as good as a short one if well-ribbed and strong at the loin, or a short back is not a fault if the chest is deep, shoulders long and flat, and stifles well bent. So long as the general principles of equality are carried out, there is plenty of room for individual difference within the same type.

There is also too much said about bone. I never saw a duffer yet but had "plenty of bone," and would often prefer looking for more to hunting game. Mr. Donner's remarks were correct, and time will prove it so. We want quality, not quantity, of bone.

A man who is not a practical sportsman will not be a successful breeder of pointers or setters, neither can a man who has never handled a dog in the field be a competent judge in the ring of pointers and setters, and if we are to have "logical" judges, our sporting dogs will only be such in theory by and by. We want practical dogs, therefore, practical breeders and practical judges.

LUKE W. WHITE.

BRIDGEPORT, Conn.

Editor Forest and Stream:

In the *American Kennel Register* alone there are more than sixty pointers who trace more or less remotely to Lily. Among them are such dogs as Rush, Rue and Sefton. According to Mr. J. W. Munson she is a "mongrel." Assuming that all owners are interested, and having two of her blood myself, I now summon Mr. Munson to prove his assertion in the most clear and definite manner, or to stand convicted of something a little worse than the misrepresentation he objects to so forcibly, and I want proof and not assertions.

In reply to Mr. Aldrich, I would simply say that if Beaufort be a cart horse in his opinion, I am content to be with a good many breeders in thinking his opinion of not much value. When he talks of showing eight weeks' old pointer puppies on the bench he must want to show us how little he knows of pointers. A dog that takes at least fifteen months to mature can scarcely, in my opinion, be fairly judged at two months, and Major Taylor indorses this by his decision at Chicago last week.

T. B. DORSEY

ELLICOTT CITY, Md.

Editor Forest and Stream:

To those who do not know the membership of the W. K. C., it would appear that those gentlemen who have defended the recent pointer judging at the New York show are disinterested persons, whereas they are either members of, or closely connected with, the club; therefore I would suggest to those gentlemen that in order to economize the space of the FOREST AND STREAM, they should all unite in one article and sign it W. K. C., and not their individual names.

Mr. Smith says a "good dog is never a bad color." A good

dog. Mr. Smith, may be of the worst possible color, but a good-looking dog cannot be a bad color. When we breed lemon and white bitches to lemon and white dogs, we want lemon and white pups, not all the colors of the rainbow in one litter.

Mr. Tileston, in his "Points of Judging," says the color of nose should be black or very dark brown in all except lemon and white. In these it may be of a deep flesh color, not black. I do not deny Bang Bang came honestly by his black nose and eyes, I simply state it as a blemish in a dog of his color.

Mr. Aldrich states that there were few dissatisfied with Mr. Sterling's decisions. The editorial remarks of the FOREST AND STREAM two weeks ago, don't verify this statement. Of course, the members of the Westminster Kennel Club are satisfied with the decisions on their own dogs by judges appointed by themselves. No one else is. The protest of forty gentlemen proves the dissatisfaction to be very great. The protest is public opinion, not that of the members of any club.

A BREEDER OF SPORTING DOGS.

Editor Forest and Stream:

In your issue of June 12 Mr. John W. Munson states in his letter that he was informed that I pronounced Meteor the handsomest pointer I ever saw. There must be a mistake somewhere, as I find it impossible to make accurate comparisons between the forms of animals with only a part of them present. After seeing Meteor and his kennel companions at exercise, during the Toronto dog show last March, I did say he was the most handsome-moving pointer I had seen move in the country, and that I would sooner own him than the balance of his kennel companions, from which statement I make no retraction. JOHN DAVIDSON.

MONROE, Mich., June 17.

Editor Forest and Stream:

For the benefit of any of your readers who have not an acquaintance with the members of the Westminster Kennel Club, I desire to say most emphatically that every insinuation and direct accusation conveyed in C. H. Mason's intemperate letter are wholly and unqualifiedly false. If my criticism of his first letter caused him merriment, as he says it did, his merriment partakes more of the form of rabies than rapture. For myself I have had quite enough newspaper controversy.

ROBT. C. CORNELL.

NEW YORK, June 21.

Editor Forest and Stream:

As some stress seems to be laid upon the statement that the Westminster Kennel Club attempted, in 1883, to buy Beaufort, let me say (though I fear it is not a matter of interest to any one) that Mr. Cornell and I, representing the club at Washington, in that year offered $300 for the dog on their behalf, and that I personally afterward raised the offer to $350. At this time neither of us had made a thorough examination of him. When later we had him out, the peculiarities (I use the word as there seems to be a difference of opinion as to whether they are points of merit or defects) which Mr. Cornell refers to were apparent, and we therefore made no further offer.

ELLIOT SMITH.

Editor Forest and Stream:

Of the forty names appended to the so-called protest of Messrs. G. W. Amory and others, appearing in your issue of 19th inst., sixteen do not appear in the list of exhibitors; two more did not exhibit pointers, and as to one (the Baltimore Kennel Club) it would be interesting to know by what right the name was signed, inasmuch as the club is said to have gone out of existence long since. The Knickerbocker Kennel Club add great strength to their signature by signing first in their corporate name and then adding a list of their officers, etc. ELLIOT SMITH.

Editor Forest and Stream:

Nothing less than the possession of exceptionally great knowledge can excuse the severity of tone assumed by Mr. Mason toward those who are so unfortunate as to differ from him. Nobody will deny his long experience, but if that experience has not brought wisdom it is all the more to his discredit. In taking Mr. Cornell to task for having admired pointers of several different types, Mr. Mason clearly implies that there is one correct type only and assumes to know that type himself beyond mistake. In this he puts himself in contradiction with the entire record of shows and field trials both here and in England. It clearly appears from this record that there are several types of form, any one of which may win according as its representative may be most perfect in his type. Nor do we even find that individual judges adhere very closely to the same form through several classes. Even Stonehenge's scale of points is quite elastic enough to cover a variety of forms, and it is manifest from his writings that he intended it should be so. (See remarks on fox-terrier judgment, page 52, "Dogs of the British Islands.") Indeed it appears that this scale was invented mainly as a check on those judges who, believing in unity of type, were prone to give preference to inferior specimens of their favorite types over better, but typically different, dogs. Mr. Mason seems, therefore, to assume that the judges of public events have hitherto been, on the average, a lot of dolts, since they have generally failed to recognize that perfect form that he knows so well.
